BIOGRAPHICAL MEMOIR OF MR BRYDONE.

THE author of this work was born in the year 1743, at Coldingham, in Berwickshire, of which parish his father was the established minister. Of his education no particulars are known, except that it was a complete course at one of the universities, and that Mr Brydone added to it an extensive acquaintance with natural science, particularly in the then almost new department of electricity. It has been stated that the first wishes of Mr Brydone respecting a profession pointed to the army; but we are not informed of the circumstances which induced him to adopt another career. In 1767, we find him accepting the situation of travelling tutor to Mr William Beckford, of Somerly in Suffolk, whom he accordingly accompanied, during that and the succeeding year, in a tour of Switzerland and Italy.

Having completed this engagement, he entered into another with Mr Fullarton, afterwards well known to the public as Colonel Fullarton, of Fullarton in the county of Ayr, a gentleman then only in his seventeenth year, but who, in the words of Robert Burns, became "a foreign ambassador almost as soon as he was a man, and a leader of armies as soon as he was a soldier, and that with an *eclat* unknown to the usual minions of a court." Colonel Fullarton distinguished himself, we believe, in the command of a large body of troops in India, and in a late period of life was governor of Trinidad. The poet just quoted makes honourable mention of him, with a reference to his connexion with Mr Brydone, in his "Vision:"

Brydone's brave ward I well could spy,  
Beneath old Scotia's smiling eye;  
Who call'd on Fame, low standing by,  
To hand him on,  
Where many a patriot name on high,  
And hero shone.

It was in the course of his travels with Mr Fullarton that he wrote the letters constituting the present work, these being addressed to his former pupil Mr Beckford. The series commences at Naples in May 1770, and, after an excursion through Sicily and Malta, terminates at the same place on the 1st of August—the journey having thus occupied two months and a half. The party included a third gentleman of the name of Glover.

The letters were published in 1773, under the title of "A Tour through Sicily and Malta,"\* and from the first the work attracted considerable attention. These islands were then nearly unknown to the British public; the singular physical phenomena presented by Mount *Ætna* in the one island, and the extraordinary society formed by the Knights of St John in the other, were calculated to make a strong impression: into all, there was, in Mr Brydone's narrative, a vivacity and playfulness in the highest degree captivating. The less superficial class of readers found a further value in this little work, in the scientific speculations introduced into it, particularly those respecting meteorology and electricity. Some of Mr Brydone's views in the latter science went much beyond his age, and the tendency of the subsequent progress of the science has been to justify the boldness with which he advanced them.

Soon after the publication of his book, Mr Brydone was elected a fellow of the Royal Society, to whose transactions he contributed some valuable papers on electricity. He also became a fellow of the Antiquarian Society, and of the Royal Society of Edinburgh. His literary and philosophical merits were at a subsequent time (December 1779) acknowledged by the government

\* In two volumes; Cadell, London; price 12s.—*Gentleman's Magazine for May 1773.*

appointment of accomptant and comptroller-general of stamp-duties, which, we presume, was a sinecure. Mr Brydone was married, April 4, 1785, to Miss Robertson, eldest daughter of the excellent author of the History of Charles V., and of America. He spent the latter part of his life in elegant retirement at Lennel House, near Coldstream in Berwickshire, a modern mansion reared on the site of an ancient convent. Sir Walter Scott, who often visited Mr Brydone at this place, takes occasion in "Marmion," when alluding to the convent as the resting-place of his hero the night before the battle of Flodden, to express his high sense of the agreeable social qualifications of the venerable traveller:

Where Lennel's convent closed their march,  
There now is left but one frail arch;  
Yet mourn thou not its cells—  
Our time a fair exchange has made—  
Hard by, in hospitable shade,  
A reverend pilgrim dwells,  
Well worth the whole Bernardine brood,  
That e'er wore sandal, frock, or hood.

Here Mr Brydone died, at an advanced age, June 19, 1818. Of his children, one is the present Countess of Minto, and another the wife of Admiral Sir Charles Adam of Barns, K.C.B.

The present edition of Mr Brydone's work has received such additions in the shape of notes as seemed necessary to bring the information forward to a late date; and, as usual in this series of reprints, all the classical quotations have been translated into English.

ADVERTISEMENT.

[BY THE AUTHOR.]

HAD there been any book in our language on the subject of the following letters, they never should have seen the light. The author wrote them for the amusement of his friends, and as an assistance to his memory; and if it will in any degree apologise for their imperfections, he can with truth declare that they never were intended for publication; nor, indeed, was that idea suggested to him till long after they were written. One principal motive, he will own, was the desire of giving to the world, and perhaps of transmitting to posterity, a monument of his friendship with the gentleman to whom they are addressed.

When Mr Foster's translation of Baron Riedesel's book first appeared, these letters were already in the press, and the author apprehended an anticipation of his subject; however, on perusal, he had the satisfaction to find that the two works did not much interfere.

In transcribing them for the press, he found it necessary both to retrench and to amplify; by which the ease of the epistolary style has probably suffered, and some of the letters have been extended much beyond their original length.

He now presents them to the public with the greatest diffidence; hoping that some allowance will be made for the very inconvenient circumstances, little favourable to order or precision, in which many of them were written: but he would not venture to new-model them, apprehending that what they might gain in form and expression they would probably lose in ease and simplicity, and well knowing that the original impressions are much better described at the moment they are felt than from the most exact recollection.

## TOUR THROUGH SICILY AND MALTA.

### ITALY.—NAPLES.

DEAR BECKFORD, *Naples, May 14, 1770.*  
I REMEMBER to have heard you regret that in all your peregrinations through Europe, you had ever neglected the island of Sicily, and had spent much of your time in running over the old beaten track, and in examining the threadbare subjects of Italy and France, when probably there were a variety of objects not less interesting, that still lay buried in oblivion in that celebrated island. We intend to profit from this hint of yours. Fullarton\* has been urging me to it with all that ardour which a new prospect of acquiring knowledge ever inspires in him; and Glover, your old acquaintance, has promised to accompany us.

The Italians represent it as impossible, as there are no inns in the island, and many of the roads are over dangerous precipices, or through bogs and forests, infested with the most resolute and daring banditti in Europe. However, all these considerations, formidable as they may appear, did not deter Mr Hamilton,† his lady, and Lord Fortrose.‡ They made this expedition last summer, and returned so much delighted with it, that they have animated us with the strongest desire of enjoying the same pleasure.

Our first plan was to go by land to Regium, and from thence cross over to Messina; but on making exact inquiry with regard to the state of the country and method of travelling, we find that the danger from the banditti in Calabria and Apulia is so great, the accommodation so wretched, and inconveniences of every kind so numerous, without any consideration whatever to throw into the opposite scale, that we soon relinquished that scheme, and in spite of all the terrors of Scylla and Charybdis, and the more real terrors of sea-sickness (the most formidable monster of the three), we have determined to go by water; and that no time may be lost, we have already taken our passage on board an English ship, which is ready to sail with the first fair wind.

Now, as this little expedition has never been considered as any part of the grand tour, and as it will probably present many objects worthy of your attention, not mentioned in any of our books of travels, I flatter myself that a short account of these will not be unacceptable to you, and may in some degree make up for your having neglected to visit them. You may

therefore expect to hear of me from every town where we stop; and when I meet with any thing deserving of notice, I shall attempt to describe it in as few words as possible. We have been waiting with impatience for a fair wind, but at present there is little prospect of it. The weather is exceedingly rough, and not a ship has been able to get out of the harbour for upwards of three weeks past. This climate is by no means what we expected to find it; and the serene sky of Italy, so much boasted of by our travelled gentlemen, does not altogether deserve the great eulogiums bestowed upon it. It is now the middle of May, and we have not as yet had any continuance of what may be called fine weather. It has indeed been abundantly warm, but seldom a day has passed without sudden storms of wind and rain, which render walking out here to the full as dangerous to our invalids as it is in England.

I am persuaded that our physicians are under some mistake with regard to this climate. It is certainly one of the warmest in Italy; but it is as certainly one of the most inconstant, and, from what we have observed, disagrees with the greater part of our valetudinarians, but more particularly with the gouty people, who have all found themselves better at Rome, which, though much colder in winter, is I believe a healthier climate. Naples, to be sure, is more eligible in summer, as the air is constantly refreshed by the sea-breeze when Rome is often scorched by the most insupportable heat. Last summer Fahrenheit's thermometer never rose higher at Naples than seventy-six; at Rome it was eighty-nine. The difference is often still more considerable. In winter it is not less remarkable. Here our greatest degree of cold was in the end of January; the thermometer stood at thirty-six; at Rome it fell to twenty-seven: so that the distance between the two extremes of heat and cold last year at Naples was only forty degrees; whereas at Rome it was no less than sixty-two. Yet by all accounts their winter was much more agreeable and healthy than ours, for they had clear frosty weather while we were deluged with rains, accompanied with very high wind. The people here assure us that in some seasons it has rained every day for six or seven weeks. But the most disagreeable part of the Neapolitan climate is the sirocco or south-east wind, which is very common at this season. It is infinitely more relaxing, and gives the vapours in a much higher degree, than the worst of our rainy Novembers. It has now blown for these seven days without intermission, and has indeed blown away all our gaiety and spirits; and if it continues much longer, I do not know what may be the consequence. It gives a degree of lassitude both to the body and mind that renders them absolutely incapable of performing their usual functions. It is not perhaps surprising that it should produce these effects on a phlegmatic English constitution, but we have just now an instance that all the mercury of France must sink under the load of this horrid leaden atmosphere. A smart Parisian marquis came here about ten days ago; he was so full of ani-

\* [The young gentleman whose travelling preceptor Mr Brydone at this time was. See Biographical Memoir.]

† [Afterwards Sir William Hamilton, K.B., ambassador of the British government at Naples from 1764 to 1800, and author of several philosophical and archaeological works. Sir William's second marriage with an obscure female, who afterwards became connected in a disgraceful manner with Lord Nelson, made much noise. He died in April 1803, in the 73d year of his age.]

‡ [Kenneth Mackenzie, grandson of William fifth Earl of Seaforth, who was attainted in 1716. Mr Mackenzie was elevated to an Irish peerage in 1766 as Viscount Fortrose, to which title that of Earl of Seaforth was added in 1771. He raised the 78th (Highland) regiment, and died in 1791.]

mal spirits that the people thought him mad. He never remained a moment in the same place, but at their grave conversations used to skip from room to room with such amazing elasticity that the Italians swore he had got springs in his shoes. I met him this morning walking with the step of a philosopher, a smelling-bottle in his hand, and all his vivacity extinguished. I asked him what was the matter? "Ah, my dear sir," said he, "I am *ennuied* to death. If this execrable wind continues, in two hours more I shall hang myself!"

The natives themselves do not suffer less than strangers; and all nature seems to languish during this abominable wind. A Neapolitan lover avoids his mistress with the utmost care in the time of the sirocco, and the indolence it inspires is almost sufficient to extinguish every passion. All works of genius are laid aside during its continuance; and when any thing very flat or insipid is produced, the strongest phrase of disapprobation they can bestow is, "Era scritto in tempo del sirocco"—that it was written in the time of the sirocco. I shall make no apology for this letter; and whenever I happen to tire you, be kind enough to remember (pray do) that it is not me you are to blame, but the sirocco wind. This will put me much at my ease, and will save us a world of time and apologies.

I have been endeavouring to get some account of the cause of this very singular quality of the sirocco; but the people here seldom think of accounting for any thing, and I do not find, notwithstanding its remarkable effects, that it has ever yet been an object of inquiry amongst them.

I have not observed that the sirocco makes any remarkable change in the barometer. When it first set in, the mercury fell about a line and a half, and has continued much about the same height ever since; but the thermometer was at forty-three the morning it began, and rose almost immediately to sixty-five; and for these two days past it has been at seventy and seventy-one. However, it is certainly not the warmth of this wind that renders it so oppressive to the spirits; it is rather the want of that genial quality, which is so enlivening, and which ever renders the western breeze so agreeable: the spring and elasticity of the air seems to be lost, and that active principle which animates all nature appears to be dead. This principle we have sometimes supposed to be nothing else than the subtle electric fluid that the air usually contains; and indeed we have found that during this wind it appears to be almost annihilated, or at least its activity exceedingly reduced. Yesterday and to-day we have been attempting to make some electrical experiments, but I never before found the air so unfavourable for them.

Sea-bathing we have found to be the best antidote against the effects of the sirocco; and this we certainly enjoy in great perfection. Lord Fortrose, who is the soul of our colony here, has provided a large commodious boat for this purpose. We meet every morning at eight o'clock, and row about half a mile out to sea, where we strip and plunge into the water; were it not for this, we should all have been as bad as the French marquis. My lord has ten watermen, who are in reality a sort of amphibious animals, as they live one-half of the summer in the sea. Three or four of these generally go in with us, to pick up stragglers, and secure us from all accidents. They dive with ease to the depth of forty, and sometimes of fifty feet, and bring up quantities of excellent shell-fish, during the summer months; but so great is their devotion, that every time they go down they make the sign of the cross, and mutter an *Ave Maria*, without which they should certainly be drowned, and were not a little scandalised at us for omitting this ceremony. To accustom us to swimming in all circumstances, my lord has provided a suit of clothes, which we wear by turns; and from a very short practice, we have found it almost as commodious to

swim with as without them; we have likewise learned to strip in the water, and find it no very difficult matter: and I am fully persuaded, from being accustomed to this kind of exercise, that in case of shipwreck we should have greatly the advantage over those who had never practised it; for it is by the embarrassment from the clothes, and the agitation that people are thrown into, from finding themselves in a situation they had never experienced before, that so many lives are lost in the water.

After bathing, we have an English breakfast at his lordship's, and after breakfast a delightful little concert, which lasts for an hour and a half. Barbella, the sweetest fiddle in Italy, leads our little band. This party, I think, constitutes one principal part of the pleasure we enjoy at Naples. We have likewise some very agreeable society amongst ourselves, though we cannot boast much of that with the inhabitants. There are, to be sure, many good people among them; but in general, there is so very little analogy betwixt an English and a Neapolitan mind, that the true social harmony, that great sweetener of human life, can seldom be produced. In lieu of this (the exchange, you will say, is but a bad one), the country round Naples abounds so much in every thing that is curious, both in art and nature, and affords so ample a field of speculation for the naturalist and antiquary, that a person of any curiosity may spend some months here very agreeably, and not without profit.

Besides the discoveries of Herculaneum and Pompeii, which of themselves afford a great fund of entertainment, the whole coast that surrounds this beautiful bay, particularly that near Puzzoli, Cuma, Micenum, and Baia, is covered with innumerable monuments of Roman magnificence. But, alas! how are the mighty fallen! This delightful coast, once the garden of all Italy, and inhabited only by the rich, the gay, and luxurious, is now abandoned to the poorest and most miserable of mortals. Perhaps there is no spot on the globe that has undergone so thorough a change, or that can exhibit so striking a picture of the vanity of human grandeur. Those very walls that once lodged a Cæsar, and Lucullus, an Anthony, the richest and most voluptuous of mankind, are now occupied by the very meanest and most indigent wretches on earth, who are actually starving for want in those very apartments that were the scenes of the greatest luxury. There, we are told, suppers were frequently given that cost £50,000, and some that even amounted to double that sum.

The luxury, indeed, of Baia was so great, that it became a proverb, even amongst the luxurious Romans themselves; and at Rome, we often find them upbraiding with effeminacy and epicurism those who spent much of their time in this scene of delights; Clodius throws it in Cicero's teeth more than once; and that orator's having purchased a villa here, hurt him not a little in the opinion of the graver and more austere part of the senate. The walls of these palaces still remain, and the poor peasants, in some places, have built up their miserable huts within them; but at present there is not one gentleman or man of fashion residing in any part of this country; the former state of which, compared with the present, certainly makes the most striking contrast imaginable. Yesterday we rode over the greater part of it, a-shooting porcupines, a new species of diversion, which I had never heard of before. We killed several of these animals on the Monte Barbaro, the place that formerly produced the Falernian wine, but now a barren waste. I don't know if you are acquainted with this kind of sport. To me, I own, its novelty was its greatest merit; and I would not at any time give a day of partridge for a month of porcupine shooting. Neither, indeed, is the flesh of these animals the most delicious in the world, though to-day most of us have dined upon it. It is extremely luscious, and soon palls upon the appetite.

We are now going to lay in our sea store, as there is some probability that we shall sail in a day or two.—

Farewell; you shall hear from me again at Messina, if we are not swallowed up by Charybdis.

VOYAGE TO SICILY.

*On board the Charming Molly, off the Island of Capri, May 15.*

We have now begun our expedition with every auspicious omen. This morning the melancholy sirocco left us; and in place of it we have gotten a fine brisk tramontane (or north wind), which in a few hours blew away all our vapours, and made us wonder how much the happiness of mankind depends on a blast of wind. After eating a hearty dinner with many of our friends at Mr Walter's, and drinking plentifully of his excellent Burgundy, we took leave in the highest spirits. Had the sirocco blown as yesterday, we should probably have been in tears; and not one of us would have suspected that we were crying only because the wind was in the south. We are not apt to suppose it; but probably a great part of our pleasures and pains depend upon such trivial causes, though always ascribed to something else; few people being willing to own themselves like a weathercock, affected by every blast. Indeed, we should have naturally imputed it to the grief of parting with that excellent family whom you know so well, which no person could ever leave without regret, or see without pleasure; but the agreeable prospect of soon meeting again (probably better qualified to amuse and entertain them) absorbed all melancholy thoughts, and even added to that alacrity which the delightful tour before us had already inspired.

We sailed at five; and, after firing our farewell signals to our friends on shore (whom we discovered with our glasses at some miles' distance), we soon found ourselves in the middle of the Bay of Naples, surrounded by the most beautiful scenery in the world. It fell calm for an hour, on purpose to give us time to contemplate all its beauties.

The bay is of a circular figure, in most places upwards of twenty miles in diameter; so that, including all its breaks and inequalities, the circumference is considerably more than sixty miles. The whole of this space is so wonderfully diversified by all the riches both of art and nature, that there is scarce an object wanting to render the scene complete; and it is hard to say whether the view is more pleasing from the singularity of many of these objects, or from the incredible variety of the whole. You see an amazing mixture of the ancient and modern; some rising to fame, and some sinking to ruin. Palaces reared over the tops of other palaces, and ancient magnificence trampled under foot by modern folly. Mountains and islands that were celebrated for their fertility changed into barren wastes, and barren wastes into fertile fields and rich vineyards. Mountains sunk into plains, and plains swelled into mountains. Lakes drunk up by volcanoes, and extinguished volcanoes turned into lakes. The earth still smoking in many places, and in others throwing out flame. In short, nature seems to have formed this coast in her most capricious mood, for every object is a *lusus nature*. She never seems to have gone seriously to work, but to have devoted this spot to the most unlimited indulgence of caprice and frolic.

The bay is shut out from the Mediterranean by the island of Capri, so famous for the abode of Augustus, and afterwards so infamous for that of Tiberius. A little to the west lie those of Ischia, Prosidea, and Nisida; the celebrated promontory of Miceum, where Æneas landed; the classic fields of Baia, Cuma, and Puzzoli, with all the variety of scenery that formed both the Tartarus and Elysium of the ancients; the Camphi Phlegrei, or burning plains, where Jupiter overcame the giants; the Monte Novo, formed of late years by the fire; the Monte Barbaro; the picturesque

city of Puzzoli, with the Solfaterra smoking above it; the beautiful promontory of Paussillipe, exhibiting the finest scenery that can be imagined; the great and opulent city of Naples, with its three castles, its harbour full of ships from every nation, its palaces, churches, and convents innumerable; the rich country from thence to Portici, covered with noble houses and gardens, and appearing only a continuation of the city; the palace of the king, with many others surrounding it, all built over the roofs of those of Herculaneum, buried near 100 feet by the eruptions of Vesuvius; the black fields of lava that have run from that mountain, intermixed with gardens, vineyards, and orchards; Vesuvius itself, in the background of the scene, discharging volumes of fire and smoke, and forming a broad track in the air over our heads, extending, without being broken or dissipated, to the utmost verge of the horizon; a variety of beautiful towns and villages round the base of the mountain, thoughtless of the impending ruin that daily threatens them. Some of these are reared over the very roofs of Pompeii and Stabia, where Pliny perished; and with their foundations have pierced through the sacred abodes of the ancient Romans, thousands of whom lie buried here, the victims of this inexorable mountain. Next follows the extensive and romantic coast of Castello Mare, Sorrentum, and Mola, diversified with every picturesque object in nature. It was the study of this wild and beautiful country that formed our greatest landscape painters. This was the school of Poussin and Salvator Rosa, but more particularly of the last, who composed many of his most celebrated pieces from the bold craggy rocks that surround this coast; and no doubt it was from the daily contemplation of these romantic objects that they stored their minds with that variety of ideas they have communicated to the world with such elegance in their works.

Now, should I tell you that this extensive coast, this prodigious variety of mountains, valleys, promontories, and islands, covered with an everlasting verdure, and loaded with the richest fruits, is all the produce of subterraneous fire, it would require, I am afraid, too great a stretch of faith to believe me; yet the fact is certain, and can only be doubted by those who have wanted time or curiosity to examine it. It is strange, you will say, that nature should make use of the same agent to create as to destroy; and that what has only been looked upon as the consumer of countries, is in fact the very power that produces them. Indeed, this part of our earth seems already to have undergone the sentence pronounced upon the whole of it; but, like the phoenix, has arisen again from its own ashes, in much greater beauty and splendour than before it was consumed. The traces of these dreadful conflagrations are still conspicuous in every corner; they have been violent in their operations, but in the end have proved salutary in their effects. The fire in many places is not extinguished, but Vesuvius is now the only spot where it rages with any degree of activity.

Mr Hamilton, our minister here, who is no less distinguished in the learned than in the polite world, has lately examined it with a truly philosophic eye, and this is the result of all his observations; however, at present I only sit down to give you an account of the prospect of this singular country, and not to write its natural history, which would lead me into too vast a field. I shall reserve that curious subject till our return, when I shall have more leisure to make you acquainted with it. I beg, therefore, you would at least suspend your judgment for the present, and do not condemn me before I am heard.

After contemplating this delightful prospect till sunset, the wind sprang up again, and we have now almost reached Capri, thirty miles distant from Naples. We have just spoken with an English ship. They tell us that the Marquis of Carmarthen, Lord Fortrose,

and Mr Hamilton, observing the calm, took a boat to make us a visit; but unfortunately mistaking their vessel for ours, we have had the mortification to miss them.

The night is very dark, and Mount Vesuvius is flaming at a dreadful rate; we can observe the red-hot stones thrown to a vast height in the air, and, after their fall, rolling down the side of the mountain. Our ship is going so smooth, that we are scarce sensible of the motion; and if this wind continue, before to-morrow night we shall be in sight of Sicily. Adieu. The captain is making a bowl of grog, and promises us a happy voyage.

16th.—All wrong; sick to death; execrable sirocco wind, and directly contrary; vile heaving waves. A plague of all sea voyages; that author was surely right, who said that "land voyages" were much to be preferred.

17th, in the morning.—For these twenty-four hours past we have been groaning to one another from our beds; execrating the waves, and wishing that we had rather been at the mercy of all the banditti of Calabria. We are now beginning to change our tune. The sirocco is gone, and the wind is considerably fallen; however, we are still three woful figures. Our servants, too, are as sick and as helpless as we. The captain says that Philip, our Sicilian man, was frightened out of his wits, and has been praying to St Januarius with all his might. He now thinks he has heard him, and imputes the change of the weather entirely to his interest with his saint.

17th, three o'clock.—Weather pleasant and favourable. A fine breeze since ten; have just come in sight of Strombolo. Our pilot says it is near twenty leagues off. We have likewise a few of the mountains of Calabria, but at a very great distance. Ship steady; and sea-sickness almost gone.

Eleven at night.—The weather is now fine, and we are all well. After spying Strombolo, by degrees we came in sight of the rest of the Lipari islands, and part of the coast of Sicily. These islands are very picturesque, and several of them still emit smoke, particularly Volcano and Volcanello; but none of them, for some ages past, except Strombolo, have made any eruptions of fire. We are just now lying within three miles of that curious island, and can see its operations distinctly. It appears to be a volcano of a very different nature from Vesuvius, the explosions of which succeed one another with some degree of regularity, and have no great variety of duration. Now, I have been observing Strombolo ever since it fell dark, with a good deal of pleasure, but not without some degree of perplexity, as I cannot account for its variety. Sometimes its explosions resemble those of Vesuvius, and the light seems only to be occasioned by the quantity of fiery stones thrown into the air; and as soon as these have fallen down, it appears to be extinguished, till another explosion causes a fresh illumination; this I have always observed to be the case with Vesuvius, except when the lava has risen to the summit of the mountain, and continued without variety to illuminate the air around it. The light from Strombolo evidently depends on some other cause. Sometimes a clear red flame issues from the crater of the mountain, and continues to blaze without interruption for near the space of half an hour. The fire is of a different colour from the explosions of stones, and is evidently produced from a different cause. It would seem as if some inflammable substance were suddenly kindled up in the bowels of the mountain. It is attended with no noise or explosion that we are sensible of. It has now fallen calm, and we shall probably have an opportunity of examining this volcano more minutely to-morrow. We were told at Naples that it had lately made a violent eruption, and had begun to form a new island at some little distance from the old; which piece of intelligence was one of our great inducements to this expedition. We think we have discovered this

island, as we have observed several times the appearance of a small flame arising out of the sea, a little to the south-west of Strombolo, and suppose it must have issued from this new island; but it is possible this light may come from the lower part of the island of Strombolo itself. We shall see to-morrow.

18th.—We are still off Strombolo, but unfortunately at present it intercepts the view of that spot from whence we observed the flame to arise, and we can see no appearance of any new island, nor indeed of any lava that has of late sprung from the old one. We have a distinct view of the crater of Strombolo, which seems to be different from Vesuvius, and all the old volcanoes that surround Naples. Of these, the craters are without exception in the centre, and form the highest part of the mountain. That of Strombolo is on its side, and not within 200 yards of its summit. From the crater to the sea, the island is entirely composed of the same sort of ashes and burnt matter as the conical part of Vesuvius; and the quantity of this matter is perpetually increasing, from the uninterrupted discharge from the mountain; for of all the volcanoes we read of, Strombolo seems to be the only one that burns without ceasing. Etna and Vesuvius often lie quiet for many months, even years, without the least appearance of fire, but Strombolo is ever at work, and for ages past has been looked upon as the great lighthouse of these seas.

It is truly wonderful how such a constant and immense fire is maintained, for thousands of years, in the midst of the ocean! That of the other Lipari islands seems now almost extinct, and the force of the whole to be concentrated in Strombolo, which acts as one great vent to them all. We still observe Volcano and Volcanello throwing out volumes of smoke, but during the whole night we could not perceive the least spark of fire from either of them.

It is probable that Strombolo, as well as all the rest of these islands, is originally the work of subterraneous fire. The matter of which they are composed in a manner demonstrates this; and many of the Sicilian authors confirm it. There are now eleven of them in all, and none of the ancients mention more than seven. Fazello, one of the best Sicilian authors, gives an account of the production of Volcano, now one of the most considerable of these islands. He says it happened in the early time of the republic, and is recorded by Eusebius, Pliny, and others. He adds, that even in his time, in the beginning of the sixteenth century, it still discharged quantities of fire and of pumice-stones; but that in the preceding century, in the year 1444, on the 5th of February, there had been a very great eruption of this island, which shook all Sicily, and alarmed the coast of Italy as far as Naples. He says the sea boiled all around the island, and rocks of a vast size were discharged from the crater; that fire and smoke in many places pierced through the waves, and that the navigation amongst these islands was totally changed, rocks appearing where it was formerly deep water; and many of the straits and shallows were entirely filled up. He observes, that Aristotle, in his book on meteors, takes notice of a very early eruption of this island, by which not only the coast of Sicily, but likewise many cities in Italy, were covered with ashes. It has probably been that very eruption which formed the island. He describes Strombolo to have been, in his time, pretty much the same as at this day, only that it then produced a great quantity of cotton, which is not now the case. The greater part of it appears to be barren. On the north side there are a few vineyards, but they are very meagre; opposite to these, there is a rock at some distance from land; it seems to be entirely of lava, and is not less than fifty or sixty feet above the water.

The whole island of Strombolo is a mountain that rises suddenly from the sea; it is about ten miles round, and is not of the exact conical form supposed common to all volcanoes. We were determined to have landed

on the island, and to have attempted to examine the volcano; but our Sicilian pilot assures us that the crater is not only inaccessible (which indeed I own it appears to be), but that we shall likewise be obliged to perform a quarantine of forty-eight hours at Messina; and that, besides, we should run a great risk of being attacked by the natives, who are little better than savages, and always on the alarm against the Turks. On weighing these reasons, and putting the question, it was carried to proceed on our voyage.

I own it is with much regret that I leave this curious island without being better acquainted with it. I have been looking with a good glass all round, but can see no marks of the eruption we heard so much of at Naples; indeed, the south-west part, where we saw the appearance of fire, is still hid from us by the interposition of the island, and if there has been an eruption, it was certainly on that side: it is probable we shall never be able to learn whether there has been one or not, or at least to make ourselves masters of any of the particulars relating to it; for events of that kind do not make such a noise in this ignorant and indolent country, as the blowing of an alce or a gooseberry bush at Christmas does in England. Strombolo rises to a great height, our pilot says higher than Vesuvius; but I think he is mistaken. Both the captain and he agree, that in clear weather it is discoverable at the distance of twenty-five leagues, and that at night its flames are to be seen much farther; so that its visible horizon cannot be less than 500 miles, which will require a very considerable elevation.

The revenue these islands bring to the King of Naples is by no means inconsiderable. They produce great quantities of alum, sulphur, nitre, cinnabar, and most sorts of fruits, particularly raisins, currants, and figs, in great perfection; some of their wines are likewise much esteemed, particularly the Malvasia, well known all over Europe.

The island of Lipari, from which all the rest take their name, is by much the largest as well as the most fertile. By the description of Aristotle, it appears that it was in his time what Strombolo is in ours, considered by sailors as a lighthouse, as its fires were never extinguished. It has not suffered from subterraneous fires for many ages past, though it every where bears the marks of its former state. This is the island supposed by Virgil, who is one of our travelling companions, to be the habitation of Æolus, but indeed all of them were formerly called Æolian. As they were full of vast caverns, roaring with internal fires, the poets feigned that Æolus kept the winds prisoners here, and let them out at his pleasure. This allegorical fiction is of great use both to Virgil and Homer, when they want to make a storm, and forms no inconsiderable part of their machinery. A goddess has nothing to do but to take a flight to the Lipari islands, and Æolus, who was the very pink of courtesy, has always a storm ready at her command.

Homer, indeed, departing sadly from his usual dignity, supposes that Æolus kept the winds here, each tied up in their respective bags; and when any particular wind was demanded, he made them a present of a bagful of it, to use at discretion. Some of the ancient historians (Diodorus, I think) says that this fable took its rise from a wise king named Æolus, who, from observing the smoke of these burning islands, and other phenomena attending them, had learned to foretell the weather; and from thence was said to have the command of the winds.

The forge of Vulcan, too, has been supposed by the poets to be placed in Hiera, one of these islands.\* Virgil

\* Amid the Hesperian and Sicilian flood,  
All black with smoke, a rocky island stood—  
The dark Vulcanian land, the region of the god.  
Here the grim Cyclops ply in vaults profound,  
The huge Æolian forge that thunders round:  
Th' eternal anvils ring the dungeon o'er;  
From side to side the fiery caverns roar—&c.

sends him here to make the celestial armour for Æneas, and gives a noble description of this gloomy habitation, where he found the Cyclops busy forging a thunderbolt for Jupiter, the account of which is very singular.\* This island is now called Volcano, the same that is recorded to have been produced by fire in the time of the republic. So that Virgil commits here a very great anachronism, in sending Vulcan to a place which at that time did not exist, nor for many ages after. But this bold poetical license he amply repays us for by the fine description he gives of it. These islands, he says, were called Volcanian as well as Æolian:

Vulcani domus, et Volcania nomine tellus.  
[Vulcan's the land, from him Vulcanian named.]

So that the change of the name from Hiera to Volcano was a very natural one. This is the island that Pliny calls Terasia; and both Strabo and he gave an account of its productions.

19th.—Found ourselves within half a mile of the coast of Sicily, which is low but finely variegated. The opposite coast of Calabria is very high, and the mountains are covered with the finest verdure. It was almost a dead calm, our ship scarce moving half a mile in an hour, so that we had time to get a complete view of the famous rock of Scylla, on the Calabrian side, Cape Pylorus on the Sicilian, and the celebrated Straits of the Faro that run between them. Whilst we were still some miles distant from the entry of the straits, we heard the roaring of the current, like the noise of some large impetuous river confined between narrow banks. This increased in proportion as we advanced, till we saw the water in many places raised to a considerable height, and forming large eddies, or whirlpools. The sea in every other place was as smooth as glass. Our old pilot told us that he had often seen ships caught in these eddies, and whirled about with great rapidity, without obeying the helm in the smallest degree. When the weather is calm, there is little danger; but when the waves meet with this violent current, it makes a dreadful sea. He says that there were five ships wrecked in this spot last winter. We observed that the current set exactly for the rock of Scylla, and would infallibly have carried any thing thrown into it against that point; so that it was not without reason the ancients have painted it as an object of such terror. It is about a mile from the entry of the Faro, and forms a small promontory, which runs a little out to sea, and meets the whole force of the waters, as they come out of the narrowest part of the straits. The head of this promontory is the famous Scylla. It must be owned that it does not altogether come up to the formidable description that Homer gives of it; the reading of which (like that of Shakspeare's Cliff) almost makes one's head giddy. Neither is the passage so wondrous narrow and difficult as he makes it. Indeed, it is probable that the breadth of it is greatly increased since his time by the violent impetuosity of the current. And this violence, too, must have always diminished in proportion as the breadth of the channel increased.

Our pilot says there are many small rocks that show their heads near the base of the large ones. These are probably the dogs that are described as howling round the monster Scylla. There are likewise many caverns that add greatly to the noise of the water, and tend still to increase the horror of the scene. The rock is near 200 feet high. There is a kind of castle or fort built on its summit, and the town of Scylla or Sciglio, containing 300 or 400 inhabitants, stands on its south side, and gives the title of prince to a Calabrese family.

\* Beneath their hands, tremendous to survey!  
Half rough, half formed, the dreadful engine lay.  
Three points of rain, three forks of hail conspire,  
Three armed with wind, and three were barb'd with fire;  
The mass they temper'd thick with livid rays,  
Fear, wrath, and terror, and the lightning's blaze.—PITT.

As the current was directly against us, we were obliged to lie-to for some hours till it turned. The motion of the water ceased for some time, but in a few minutes it began in the opposite direction, though not with such violence. We lay just opposite to Cape Pylorus, where the lighthouse is now built. It is said to have been thus named by Hannibal, in recompense to Pelorus his pilot, for having put him to death on this spot, on a false suspicion of his wanting to betray him; for seeing himself landlocked on all sides, he thought there was no escaping, and that Pelorus had been bribed to deliver him up; but as soon as he discovered the straits, he repented of his rashness, and some years afterwards erected a statue here, in atonement to the manes of Pelorus. Pomponius Mela tells this story, from whence he draws two very wise inferences: that Hannibal must have been extremely passionate, and that he knew nothing at all of geography. Others deny this authority, and say it was named Pelorus from Ulysses' pilot, who was drowned near to this place; but there can be no sort of foundation for this conjecture, for Ulysses' whole crew were drowned at the same time, and he himself was driven through these straits mounted on the broken mast of his ship. It is, like most disputes among antiquaries, a matter of mighty little consequence, and I leave you at full liberty to choose which of the two accounts you please.

From hence we had an opportunity of observing a pretty large portion of Calabria, which formerly constituted a considerable part of that celebrated country known by the name of Great Greece, and looked upon as one of the most fertile in the empire. These beautiful hills and mountains are covered with trees and brushwood to the very summit, and appear pretty much in the same state as some of the wilds of America that are just beginning to be cultivated. Some little spots where the woods are cleared away, just serve to show the natural fertility of the soil, and what this country might soon be brought to, were industry and population encouraged; but it still remains a good deal in the same situation as when the barbarous nations left it; and I believe it is hard to say whether their tyranny or that of Spain has been the most oppressive. After the invasion of those nations, and during the time of the dark and barbarous ages, this country (like many others), from the highest state of culture and civilisation, became a wild and barren wilderness, overgrown with thickets and forests; and, indeed, since the revival of arts and agriculture, perhaps of all Europe this is the country that has profited the least—retaining still, both in the wildness of its fields and ferocity of its inhabitants, more of the Gothic barbarity than is to be met with any where else. Some of these forests are of a vast extent, and absolutely impenetrable, and no doubt conceal in their thickets many valuable monuments of ancient magnificence. Of this, indeed, we have a very recent proof in the discovery of *Pæstum*, a Grecian city, that had not been heard of for many ages; till of late some of its lofty temples were seen peeping over the tops of the woods, upbraiding mankind for their shameful neglect, and calling upon them to bring it once more to light. Accordingly, curiosity, and the hopes of gain, a still more powerful motive, soon opened a passage, and exposed to view these valuable and respectable relics. But here it would be out of place to give you an account of them; I shall reserve that till my return.

As soon as our ship entered the current, we were carried along with great velocity towards Messina, which is twelve miles from the entry of the straits.\* However, as the passage widens in proportion as you advance, the current of consequence becomes less ra-

pid. At Messina, it is four miles broad. At the mouth of the straits, betwixt the promontories of Pelorus in Sicily and the Coda de Volpe (or the Fox's Tail) in Calabria, it appears scarcely to be a mile. Most of the ancient writers are of opinion that Sicily was formerly joined to the continent in this spot, and that the separation must have been made by some violent convulsion of the earth. If this is true, which indeed does not appear improbable, it must have happened far beyond the reach of all historians, as none of them, at least that I have seen, pretend any thing but conjecture for the foundation of their opinion.\* Indeed, Claudian (were credit to be given to poets) says positively,

Trinacria quondam Italiæ pars una fuit.

[Trinacria (Sicily) was once a part of Italy.]

And Virgil, too, in this third *Æneid*, tells the same story:

Hæc loca vi quondam, et vasta convulsa ruina, &c.

[The Italian shore,

And fair Sicilia's coast, were one, before

An earthquake caused the flaw.—*Dryden's Virgil.*]

Pliny, Strabo, Diodorus, and many others, both historians and philosophers, are of the same sentiments, and pretend that the strata on the opposite sides of the strait perfectly correspond; like the white rocks near Dover and Boulogne, which have given rise to an opinion of the same kind. However, the similarity in that case is much more striking, to the eye at least, than in this.

The approach to Messina is the finest that can be imagined; it is not so grand as that of Naples, but it is much more beautiful, and the quay exceeds any thing I have ever yet seen, even in Holland. It is built in the form of a crescent, and is surrounded by a range of magnificent buildings, four storeys high, and exactly uniform, for the space of an Italian mile.†

\* [Sicily, anciently called Trinacria, is the largest and most populous island in the Mediterranean, being 180 miles in length by 130 in breadth, and containing, according to a late census, 1,787,771 inhabitants. The country is beautifully diversified by hill and vale, is fertile, and possesses an agreeable climate; but owing to the rudeness, indolence, and licentiousness of the inhabitants, the want of an enlightened government, and the consequent absence of all the social institutions which favour industry, the island has a very humble place in the commerce of Europe. It is, nevertheless, considered as improving. The exports, which consist of corn, hemp, oil, wine, sulphur, silk, &c., and the imports, which are chiefly of manufactured articles, respectively amount only to about a quarter of a million of British money. The Greek colonies of Syracuse, Agrigentum, and Messina, particularly the first, cast a great lustre on ancient Sicilian history, on account of their flourishing commerce, their advance in the arts, and their military achievements. After passing through the hands of many masters, the island was conquered, or rather regained, by Spain, in 1733. In 1759, it was, in union with Naples, placed under the government of Ferdinand, third son of Charles III. of Spain, the title of the united states being the Kingdom of the Two Sicilies. Ferdinand II., grandson of Ferdinand I., is the present monarch, and the affairs of Sicily are now administered by a council of eight, appointed by the king, and who remain constantly at his residence; the affairs of Naples being in like manner administered by a council of sixteen, and the two councils uniting to deliberate on affairs concerning both countries. The nobility of Sicily consists of six dukes, 217 princes, 217 marquises, 2000 barons, and the same number of an order called gentlemen; and the island contains 1117 convents, giving accommodation and support to 30,000 monks and 30,000 nuns. In all, there are 300,000 persons, or a sixth of the whole population, who either are ecclesiastics, or live upon ecclesiastical revenues. The enormous amount of the non-productive classes, in a country where there is no mercantile or middle class, necessarily depresses the condition of the working population, who, in such circumstances, become little superior to the beasts of burden which man calls in to aid him in his labours.]

† [The whole of this splendid line of palaces, usually called the Palazzata, was destroyed by the earthquake of 1783, when most of the inhabitants were buried in the ruins. When the rebuilding had proceeded to the first storey, government interfered to

\* [These straits, it is said, were for the first time passed by a modern fleet, when Nelson, after visiting Naples, advanced to the coast of Egypt in pursuit of Bonaparte, in 1798.]

The street betwixt these and the sea is about 100 feet wide, and forms one of the most delightful walks in the world. It enjoys the freest air, and commands the most beautiful prospect; it is only exposed to the morning sun, being shaded all the rest of the day by these buildings. It is besides constantly refreshed by the cooling breeze from the straits; for the current of the water produces likewise a current in the air, that renders this one of the coolest habitations in Sicily.

We cast anchor about four this afternoon, near the centre of this enchanted semicircle, the beauty of which greatly delighted us; but our pleasure was soon interrupted by a discovery that the name of one of our servants had been omitted in our bills of health, and an assurance from the captain that if he were discovered, we should certainly be obliged to perform a long quarantine. Whilst we were deliberating upon this weighty matter, we observed a boat with the people of the health-office approaching us. We had just time to get him wrapped up in a hammock, and shut down below the hatches, with orders not to stir in case of a search, and not to appear again above deck till he should be called. The poor fellow was obliged to keep in his hole till it was dark, as our consul, and some people of the health-office, stayed on board much longer than we could have wished; and we are still obliged to conceal him, for if he be discovered we shall probably get into a very bad scrape. They are particularly strict here in this respect, and indeed they have great reason to be so, since this beautiful city was almost depopulated by the plague in the year 1743, when upwards of 70,000 people are said to have died in it and its district in the space of a few months.

We have now got on shore, and are lodged in the most wretched of inns, although said to be a first-rate one for Sicily; but we are contented, for surely after bad ship-accommodation and sea-sickness, any house will appear a palace, and any bit of dry land a paradise.

I shall send this off by the post, which goes to-morrow for Naples, and shall continue from day to day to give you some account of our transactions: trifling as they are, there will probably be something new, and it will add greatly to the pleasure of our expedition to think that it has contributed to your entertainment. Adieu. Ever yours, &c.

~~~~~  
SICILY.—MESSINA.

*Messina, May 20.*

THE harbour of Messina is formed by a small promontory or neck of land that runs off from the east end of the city, and separates that beautiful basin from the rest of the straits. The shape of this promontory is that of a reaping-hook, the curvature of which forms the harbour, and secures it from all winds. From the striking resemblance of its form, the Greeks, who never gave a name that did not either describe the object or express some of its most remarkable properties, called this place Zankle, or the sickle, and feigned that the sickle of Saturn fell on this spot and gave it its form. But the Latins, who were not quite so fond of fable, changed its name to Messina (from *messis*, a harvest), because of the great fertility of its fields. It is certainly one of the safest harbours in the world after ships have got in, but it is likewise one of the most difficult of access. The celebrated gulf or whirlpool of Charybdis lies near to its entry, and often occasions such an intestine and irregular motion in the water,

prevent their further progress, on the ground that edifices higher than one storey in such a situation were dangerous. The Palazzata now, therefore, consists of a row of low buildings, with docked pillars and pilasters, and the other parts of the architectural design in general broken short, and covered in many instances by projecting tilework of mean appearance.]

that the helm loses most of its power, and ships have great difficulty to get in, even with the fairest wind that can blow. This whirlpool, I think, is probably formed by the small promontory I have mentioned, which contracting the straits in this spot, must necessarily increase the velocity of the current; but no doubt other causes of which we are ignorant concur, for this will by no means account for all the appearances which it has produced. The great noise occasioned by the tumultuous motion of the waters in this place, made the ancients liken it to a voracious sea-monster perpetually roaring for its prey; and it has been represented by their authors as the most tremendous passage in the world. Aristotle gives a long and formidable description of it in his 125th chapter *De Admirandis*, which I find translated in an old Sicilian book I have got here. It begins, "Adeo profundum, horridumque spectaculum," &c.; but it is too long to transcribe. It is likewise described by Homer,\* 12th of the *Odyssey*; Virgil,† 3d *Æneid*; Lucretius, Ovid, Sallust, Seneca, as also by many of the old Italian and Sicilian poets, who all speak of it in terms of horror, and represent it as an object that inspired terror even when looked on at a distance. It certainly is not now so formidable, and very probably the violence of this motion, continued for so many ages, has by degrees worn smooth the rugged rocks and jutting shelves that may have intercepted and confined the waters. The breadth of the straits, too, in this place, I make no doubt is considerably enlarged. Indeed, from the nature of things it must be so; the perpetual friction occasioned by the current must wear away the bank on each side, and enlarge the bed of the water.

The vessels in this passage were obliged to go as near as possible to the coast of Calabria, in order to avoid the suction occasioned by the whirling of the waters in this vortex;‡ by which means, when they came to the narrowest and most rapid part of the straits, betwixt Cape Pylorus and Scylla, they were in great danger of being carried upon that rock. From whence the proverb still applied to those who in attempting to avoid one evil fall into another—

Incidit in Scyllam, cupiens vitare Charybdim.

[Who flies Charybdis, upon Scylla strikes.]

There is a fine fountain of white marble on the quay,

\* Dire Scylla there a scene of horror forms,  
And here Charybdis fills the deep with storms;  
When the tide rushes from her rumbling caves,  
The rough rock roars, tumultuous boil the waves—  
They toss, they foam, a wild confusion raise,  
Like waters bubbling o'er the fiery blaze;  
Eternal mists obscure the aerial plain,  
And high above the rock she spouts the main.  
When in her gulfs the rushing sea subsides,  
She drains the ocean with her reluctant tides.  
The rock rebellows with a thundering sound;  
Deep, wondrous deep, below appears the ground.—POPE.

† That realm of old, a ruin huge, was rent  
In length of ages from the continent.  
With force convulsive burst the isle away;  
Through the dread opening broke the thundering sea.  
At once the thundering sea Sicilia tore,  
And sunder'd from the fair Hesperian shore;  
And stant the neighbouring coasts and towns divides  
With scanty channels and contracted tides.  
Fierce to the right tremendous Scylla roars,  
Charybdis on the left the flood devours:  
Thrice swallow'd in her womb subsides the sea,  
Deep, deep as hell, and thrice she spouts away,  
From her black bellowing gulfs disgorged on high,  
Waves after waves that dash against the sky.—PITT.

‡ [In reality, Charybdis is not a vortex of the ordinary nature, and does not endanger vessels by suction. It is said rather to have a centrifugal or repelling force. The danger seems to arise chiefly from the tumultuous movements of the water, which often breaks into three, four, or more whirling centres, amidst which all common expedients for guiding or managing vessels are in vain. The Sicilian government retains a body of pilots, for the express purpose of guiding vessels safely in this dangerous place.]

representing Neptune holding Scylla and Charybdis chained, under the emblematical figures of two sea-monsters, as represented by the poets.

The little neck of land, forming the harbour of Messina, is strongly fortified. The citadel, which is indeed a very fine work, is built on that part which connects it with the mainland. The farthest point, which runs out to sea, is defended by four small forts, which command the entry into the harbour. Betwixt these lie the lazaret, and a lighthouse to warn sailors of their approach to Charybdis, as that other on Cape Pylorus is intended to give them notice of Scylla.

It is probably from these lighthouses (by the Greeks called *pharoi*) that the whole of this celebrated strait has been denominated the Faro of Messina.

There are a number of galleys and galliots in this beautiful harbour, which still add greatly to its beauty. Three of these sailed this morning, in order to cruise round the island, and to protect it from the sudden invasions of the barbarians, who are often very troublesome on the south coast. These vessels made a very picturesque appearance as they went out of the harbour; their oars moving all together with the greatest regularity. I think there are nine or ten men to each oar; and, indeed, it appears to be the hardest work you can imagine. They all rise every stroke of the oar, and when they pull, they almost throw themselves on their backs, and seem to exert their utmost force. These wretches are chained to their oars, and sleep every night on the bare benches, without any thing to throw over them. Yet, what is strange, notwithstanding all the misery they suffer, I am told there was never known an instance of any of them putting themselves to death. They often, indeed, confer that favour upon one another, but it is only in their quarrels, and by no means out of kindness. In a company of English in the same circumstances, promotion would probably go on much faster, as there would be no want of vacancies, provided only ropes and knives were to be had.

We intended this morning to have paid our respects to the Prince of Villa Franca, the governor, and to have delivered our letters; but he is gone to his country-house, and as there are no carriages to be had, we are obliged to wait his arrival in town, which will probably be to-morrow or next day.

We are still under a good deal of uneasiness about our servant, and are obliged to conceal him carefully from the people of the health-office, who seem to haunt us, as we have met them this morning in all our walks. Were he to be discovered, perhaps some of us might have the pleasure of making a little voyage on board one of those galleys for our amusement. Indeed, the captain of the ship, poor fellow, would run the greatest risk, who is obliged to answer for every person on board. We shall leave this place as soon as possible; for I do not believe there is much more to be seen about it.

20th, at night.—After dinner, our depute-consul (a Sicilian) carried us to several convents, where we were received by the nuns with great politeness and affability. We conversed with them for some hours through the grate, and found some of them by no means deficient either in point of knowledge or sprightliness; but none of them had sincerity enough (which we met with in Portugal more than once) to acknowledge the unhappiness of their situation. All pretended to be happy and contented, and declared they would not change their prison for the most brilliant situation in life. However, some of them had a soft melancholy in their countenances, that gave the lie to their words; and I am persuaded, in a *tête-à-tête*, and on a more intimate acquaintance, they would have told a very different story. Several of them are extremely handsome, but, indeed, I think they always appear so; and I am very certain, from frequent experience, that there is no artificial ornament, or studied embellishment whatever, that can produce half so strong an effect, as the modest and

simple attire of a pretty young nun, placed behind a double iron grate. To see an amiable, unaffected, and unadorned person, that might have been an honour and an ornament to society, make a voluntary resignation of her charms, and give up the world and all its pleasures, for a life of fasting and mortification, it cannot fail to move our pity;

And pity melts the mind to love.

There is another consideration which tends much to increase these feelings; that is, our total incapacity ever to alter her situation. The pleasure of relieving an object in distress is the only refuge we have against the pain which the seeing of that object occasions; but here this is utterly denied us, and we feel with sorrow that pity is all we can bestow.

From these, and the like reflections, a man generally feels himself in bad spirits after conversing with amiable nuns. Indeed, it is hardly possible, without a heavy heart, to leave the grate, that inexorable and impenetrable barrier. At last we took our leave, expressing our happiness in being admitted so near them, but at the same time deploring our misery at seeing them for ever removed at so immeasurable a distance from us. They were much pleased with our visit, and begged we would repeat it every day during our stay at Messina; but this might prove dangerous.

On leaving the convent, we observed a great concourse of people on the top of a high hill, at some distance from the city. The consul told us it was the celebration of a great festival in honour of St Francis, and was worth our going to see. Accordingly, we arrived just as the saint made his appearance. He was carried through the crowd with vast ceremony, and received the homage of the people with a becoming dignity; after which he was again lodged in his chapel, where he performs a number of miracles every day, to all those who have abundance of money and abundance of faith. His ministers, however, are only a set of poor greasy capuchins, who, indeed, do not seem to have enriched themselves in his service. In general, he is but a shabby master, if one may judge by the tattered clothes of his servants; and St Benedict, who does not pretend to half his sanctity, beats him all to nothing. The people continued to dance in soft Sicilian measures till after sunset, when they retired. Many of the country girls are extremely handsome, and dance with a good grace. The young fellows were all in their Sunday's clothes, and made a good appearance. The assembly room was a fine green plain on the top of the hill. It pleased us very much, and put us in mind of some of Theocritus's descriptions of the Sicilian pleasures. But Theocritus, if he could have raised up his head, would probably have been a good deal puzzled what to make of the shabby figure of St Francis, marching through amongst them with such majesty and solemnity. Another part of the ceremony, too, would have greatly alarmed him, as indeed it did us. The whole court before the church was surrounded with a triple row of small iron cannon, about six inches long; these were charged to the muzzle, and rammed very hard; after which they were set close to each other, and a train laid, that completed the communication through the whole number, which must have exceeded 2000. Fire was set to the train, and in two or three minutes the whole was discharged by a running fire, the reports following one another so quick, that it was impossible for the ear to individualise them. The effect was very grand; but it would have been nothing without the fine echo from the high mountains on each side of the straits, which prolonged the sound for some considerable time after the firing was finished.

The view from the top of this hill is beautiful beyond description. The straits appear like a vast majestic river flowing slowly betwixt two ridges of mountains, and opening by degrees from its narrowest point, till it swells to the size of an ocean; its banks, at the same time, adorned with rich corn-fields, vineyards, orch-

ards, towns, villages, and churches. The prospect is terminated on each side by the tops of high mountains covered with wood.

We observed in our walks to-day many of the flowers that are much esteemed in our gardens, and others, too, that we are not acquainted with. Larkspur, flos Adonis, Venus's looking-glass, hawkweed, and very fine lupins, grow wild over all these mountains. They have likewise a variety of flowering shrubs; particularly one in great plenty, which I do not recollect ever to have seen before: it bears a beautiful round fruit of a bright shining yellow. They call it *il pomo dorò*, or golden apple. All the fields about Messina are covered with the richest white clover, intermixed with a variety of aromatic plants, which perfume the air, and render their walks exceedingly delightful. But what is remarkable, we were most sensible of this perfume when walking on the harbour, which is at the greatest distance from these fields. I mentioned this peculiarity to a Messinese gentleman, who tells me, that the salt produced here by the heat of the sun, emits a grateful odour, something like violets, and it is that probably which perfumes the sea-shore. On consulting Fazzello *De rebus Siculis*, I find he takes notice of the same singularity, and likewise observes, that the water of the straits has a viscous or glutinous quality, which by degrees cements the sand and gravel together, and at last consolidates them to the solidity of rock.

There are fine shady walks on all sides of Messina; some of these run along the sea-shore, and are for ever fanned by the cooling breeze from the straits. The houses are large, and most of the articles of life are cheap and in plenty, particularly fish, which are reckoned better here than any where else in the Mediterranean. The hire of lodgings is next to nothing; almost one-half of that noble range of buildings I have described being absolutely uninhabited since the desolation of 1743; so that the proprietors are glad to get tenants on any terms. It now occurs to me that from all these considerations, there is no place I have seen so admirably calculated for the residence of that flock of valetudinarians, which every autumn leave our country with the swallows in search of warm climates. I have been inquiring with regard to their winter season, and find all agree that in general it is much preferable to that of Naples. They allow they have sometimes heavy rain for two or three weeks, but it never lasts longer; and besides, they have always some fair hours every day, when people can go out for exercise; for the moment the rain is over the walks are dry, the soil being a light gravel.

The advantages of Messina over Naples in other respects, I think, are considerable. At Naples there are no walks; and the truth is, they have no occasion for them, no more indeed than they have for legs; for you know as well as I, that walking there is little less infamous than stealing; and any person that makes use of his limbs is looked upon as a blackguard, and despised by all good company. The rides, too, are all at a great distance, and you are obliged to go some miles on streets and pavement before you get into the country; besides passing the vile grotto of Pansillippe, where you are in danger of being blinded and stifled with dust. There are seldom any public diversions here; the attending of which at Naples, and complying with their bad hours, does often more than counteract all the benefit obtained from the climate. That detestable practice of gaming, too, is by no means so prevalent here; which, from the anxiety it occasions to the mind, and lassitude to the body, must be death to all hectic people, weak breasts, or delicate nerves. I could say much more on this subject, but as I have many of these circumstances only from the report of the inhabitants, it makes me more diffident than if I had known them from my own experience.

We found our banker, Mr M——, a very sensible man, and spent some hours with him, both this morn-

ing and evening, very agreeably. He has given us some account of the police of the country, the most singular, perhaps, of any in the world; to such a degree, indeed, that I shall not venture to tell it you till I have talked it over with some other people, to see if the accounts agree; though, from the character that gentleman bears, both here and at Naples, he is as good authority as any in the island.

The Prince of Villa Franca is arrived, so that we shall probably have our audience to-morrow morning. Adieu. We are just going to sup upon steaks made of the *pesce spada*, or sword-fish, which are caught in great plenty in these seas. The sword of this one is upwards of four feet long, and a formidable weapon it is—not unlike a Highland broad-sword. This fish, when cut, bears a perfect resemblance to flesh—so much, that none of us doubted it was beef-steaks they were dressing for us, and expressed our surprise at finding that dish in Sicily. Good night.

#### SICILIAN BANDITTI.—FATA MORGANA.

21st.—We are just returned from the prince's. He received us politely, but with a good deal of state. He offered us the use of his carriages, as there are none to be hired, and in the usual style desired to know in what he could be of service to us. We told him (with an apology for our abrupt departure) that we were obliged to set off to-morrow, and begged his protection on our journey. He replied, that he would give orders for guards to attend us, that should be answerable for every thing; that we need give ourselves no further trouble; that whatever number of mules we had occasion for should be ready at the door of the inn, at any hour we should think proper to appoint: he added, that we might entirely rely on those guards, who were people of the most determined resolution, as well as of the most approved fidelity, and would not fail to chastise on the spot any person who should presume to impose upon us.

Now, who do you think these trusty guards are composed of? Why, of the most daring, and most hardened villains, perhaps, that are to be met with upon earth, who, in any other country, would have been broken upon the wheel or hung in chains, but are here publicly protected, and universally feared and respected. It was this part of the police of Sicily that I was afraid to give you an account of: but I have now conversed with the prince's people on the subject, and they have confirmed every circumstance Mr M. made me acquainted with.

He told me, that in this east part of the island, called Val Demoni (from the devils that are supposed to inhabit Mount *Ætna*), it has ever been found impracticable to extirpate the banditti; there being numberless caverns and subterraneous passages in that mountain, where no troops could possibly pursue them: that besides, as they are known to be perfectly determined and resolute, never failing to take a dreadful revenge on all who have offended them, the Prince of Villa Franca has embraced it, not only as the safest, but likewise as the wisest and most politic scheme, to become their declared patron and protector. And such of them as think proper to leave their mountains and forests, though perhaps only for a time, are sure to meet with good encouragement and security in his service; they enjoy the most unbounded confidence, which in no instance they have ever yet been found to make an improper or dishonest use of. They are clothed in the prince's livery, yellow and green, with silver lace, and wear likewise a badge of their honourable order, which entitles them to universal fear and respect from the people.

I have just been interrupted by an upper servant of the prince's, who, both by his looks and language, seems to be of the same worthy fraternity. He tells

me that he has ordered our muleteers, at their peril, to be ready by daybreak, but that we need not go till we think proper; for it is their business to attend on *nostrî excellenzi*. He says he has likewise ordered two of the most desperate fellows in the whole island to accompany us; adding, in a sort of whisper, that we need be under no apprehension, for if any person should presume to impose upon us to the value of a single *baiocc*,\* they would certainly put them to death. I gave him an *ounce*,† which I knew was what he expected; on which he redoubled his bows and his excellenzis, and declared we were the most *honorabili signori* he had ever met with, and that if we pleased, he himself should have the honour of attending us, and would chastise any person that should dare to take the wall of us, or injure us in the smallest trifle. We thanked him for his zeal, showing him we had swords of our own. On which, bowing respectfully, he retired.

I can now, with more assurance, give you some account of the conversation I had with Signor M., who, as I said, appears to be a very intelligent man, and has resided here for these many years.

He says, that in some circumstances these banditti are the most respectable people of the island, and have by much the highest and most romantic notions of what they call their point of honour; that, however criminal they may be with regard to society in general, yet, with respect to one another, and to every person to whom they have once professed it, they have ever maintained the most unshaken fidelity. The magistrates have often been obliged to protect them, and even pay them court, as they are known to be perfectly determined and desperate; and so extremely vindictive, that they will certainly put any person to death who has ever given them just cause of provocation. On the other hand, it never was known that any person who had put himself under their protection, and showed that he had confidence in them, had cause to repent of it, or was injured by any of them in the most minute trifle; but, on the contrary, they will protect him from impositions of every kind, and scorn to go halves with the landlord, like most other conductors and travelling servants, and will defend him with their lives if there is occasion. That those of their number who have thus enlisted themselves in the service of society, are known and respected by the other banditti all over the island, and the persons of those they accompany are ever held sacred. For these reasons, most travellers choose to hire a couple of them from town to town, and may thus travel over the whole island in safety. To illustrate their character the more, he added two stories, which happened but a few days ago, and are still in every body's mouth.

A number of people were found digging in a place where some treasure was supposed to have been hid during the plague: as this had been forbid under the most severe penalties, they were immediately carried to prison, and expected to have been treated without mercy; but luckily for the others, one of these heroes happened to be of the number. He wrote to the Prince of Villa Franca, and made use of such powerful arguments in their favour, that they were all immediately set at liberty.

This will serve to show their consequence with the civil power; the other story will give you a strong idea of their barbarous ferocity, and the horrid mixture of stubborn vice and virtue (if I may call it by that name) that seems to direct their actions. I should have mentioned that they have a practice of borrowing money from the country people, who never dare refuse them; and if they promise to pay it, they have ever been found punctual and exact, both as to the time and the sum; and would much rather rob and murder an innocent person, than fail of payment at

the day appointed; and this they have often been obliged to do, only in order, as they say, to fulfil their engagements, and to save their honour.

It happened within this fortnight that the brother of one of these heroic banditti having occasion for money, and not knowing how to procure it, determined to make use of his brother's name and authority, an artifice which he thought could not easily be discovered; accordingly, he went to a country priest, and told him his brother had occasion for twenty ducats, which he desired he would immediately lend him. The priest assured him that he had not then so large a sum, but that if he would return in a few days, it should be ready for him. The other replied, that he was afraid to return to his brother with this answer, and desired that he would by all means take care to keep out of his way, at least till such time as he had pacified him, otherwise he could not be answerable for the consequences. As bad fortune would have it, the very next day the priest and the robber met in a narrow road; the former fell a-trembling as the latter approached, and at last dropped on his knees to beg for mercy. The robber, astonished at his behaviour, desired to know the cause of it. The trembling priest answered, "*Il denaro, il denaro*—the money, the money; but send your brother to-morrow, and you shall have it." The haughty robber assured him that he disdain'd taking money of a poor priest; adding, that if any of his brothers had been low enough to make such a demand, he himself was ready to advance the sum. The priest then acquainted him with the visit he had received the preceding night from his brother by his order, assuring him, that if he had been master of the sum, he should immediately have supplied it. "Well," says the robber, "I will now convince you whether my brother or I are most to be believed; you shall go with me to his house, which is but a few miles distant." On their arrival before the door, the robber called on his brother, who, never suspecting the discovery, immediately came to the balcony; but on perceiving the priest, he began to make excuses for his conduct. The robber told him there was no excuse to be made; that he only desired to know the fact, whether he had gone to borrow money of that priest in his name or not? On his owning he had, the robber with deliberate coolness lifted his blunderbuss to his shoulder, and shot him dead; and, turning to the astonished priest, "You will now be persuaded," said he, "that I had no intention of robbing you at least."

You may now judge how happy we must be in the company of our guards. I don't know but this very hero may be one of them, as we are assured they are two of the most intrepid and resolute fellows in the island. I will not close this letter till I give you some account of our journey. In the mean time, adieu. We are going to take a look of the churches and public buildings: but with these I shall trouble you very little.

21st, at night.—We have been well entertained, both from what we have seen and heard. We used to admire the dexterity of some of the divers at Naples, when they went to the depth of forty-eight or fifty feet, and could not conceive how a man could remain three minutes under water without drawing breath; but these are nothing to the feats of one Colas, a native of this place, who is said to have lived for several days in the sea, without coming to land, and from thence got the surname of *Pesce*, or the fish. Some of the Sicilian authors affirm that he caught fish merely by his agility in the water; and the credulous Kircher asserts that he could walk across the straits at the bottom of the sea. Be that as it will, he was so much celebrated for swimming and diving, that one of their kings (Frederick) came on purpose to see him perform; which royal visit proved fatal to poor *Pesce*; for the king, after admiring his wonderful force and agility, had the cruelty to propose his diving near the

\* A small coin.

† About eleven shillings.

gulf of Charybdis; and to tempt him the more, threw in a large golden cup, which was to be his prize, should he bring it up. Pese made two attempts, and astonished the spectators by the time he remained under water; but in the third it is thought he was caught by the whirlpool, as he never appeared more; and his body is said to have been found some time afterwards near Taurominum (about thirty miles distant)—it having been observed that what is swallowed up by Charybdis is carried south by the current, and thrown out upon that coast. On the contrary, nothing wrecked here was ever carried through the straits, or thrown out on the north side of Sicily, unless we believe what Homer says of the ship of Ulysses.

We have been again to take a view of the straits at this famous whirlpool, and are more and more convinced that it must be infinitely diminished; indeed, in comparison of what it was, almost reduced to nothing. The sea appeared to have no extraordinary motion there, and ships and boats seemed to pass it with ease. When we compare this its present state with the formidable description of so many ancient authors, poets, historians, and philosophers, it appears indeed not improbable that this island has been torn from the continent by some violent convulsion, and that near to this spot huge caverns have been opened, which, drinking in the waters in one course of the current, and throwing them out in the other, may perhaps in some measure account for the phenomena of Charybdis. I find it described both by Homer and Virgil, as alternately swallowing up and throwing out every object that approached it.\* Now, is it not probable that these caverns in process of time have been in a great measure filled up by the immense quantities of rocks, sand, gravel, &c., that were perpetually carried in by the force of the current? I own I am not quite satisfied with this solution, but at present I cannot think of a better. The fact, however, is certain, that it must have been a dreadful object even in Virgil's time, else he never would have made Æneas and his fleet perceive its effects at so great a distance, and immediately run out to sea to avoid it; nor would he have made Helenus at such pains to caution him against that dangerous gulf, and advise him rather to make the whole tour of Sicily than attempt to pass it. Indeed, it is so often mentioned both in the voyage of Æneas and Ulysses, and always in such frightful terms, that we cannot doubt of its having been a very terrible object.†

\* *Dextrum Scylla latus, Levum implacata Charybdis*

*Obsidet, atque imo barathri ter gurgite vastos*

*Sorbet in abruptum fluctus, rursusque sub auris*

*Erigit alternos, et sidera verberat unda.*

[Far on the right her dogs foul Scylla hides;

Charybdis roaring on the left presides,

And in her greedy whirlpool sucks the tides;

Then spouts them from below: with fury driven,

The waves mount up, and wash the face of heaven.

DRYDEN.]

† Seneca gives this account of it in a letter to Lucillus:—"Scyllam saxum esse, et quidem terribile navigantibus optime scio; Charybdis an respondeat fabulis perscribi mihi desidero, fac nos certiores, utrum uno tantum vento agatur in vortices, an omnis tempestas, ac mare illud contorqueat, et an verum sit quiddam illo freti turbine abruptum est," &c.

"That Scylla is a rock, and one terrible to navigators, I know very well; I wish you, however, to write and tell me if Charybdis agrees with the poetical accounts of it. Inform me whether the whirlpool is dangerous under one wind alone, or whether every tempest has the power of disturbing that sea; and if every thing absorbed in that yawning pool of the straits," &c.]

And the following is a translation from Strabo:—"Ante urbem Paululum in trajectu Charybdis ostenditur: profundum quidem immensum: quo inundationes freti: mirum in modum navigia detrahunt: magnas per circumdationes, et vortices precipitatas, quibus absorptis, ac dissolutis; naufragiorum fragmenta ad Tauromitanum litus atrahuntur," &c.

["Before the town of Paululum, in the strait, Charybdis is

After seeing the beautiful harbour of Messina, we have found nothing much worthy of notice in the city. Some of the churches are handsome, and there are a few tolerable paintings. One ceremony, from the account they give of it, I should like much to have seen—the celebration of the feast of the Vara. It appears, indeed, to be a very singular exhibition, and I am heartily sorry it does not happen at this season. In order to the more dignified appearance of the Virgin Mary on this occasion, they have invented a very curious machine, which I am told represents heaven, or at least a part of it. It is of a huge size, and moves through the street with vast pomp and ceremony. In the centre is the principal figure, which represents the Virgin; and a little higher, there are three others to denote the Trinity. Round these there are a number of wheels, said to be of a very curious construction. Every wheel contains a legion of angels, according to their different degrees of precedency—seraphim, cherubim, and powers. These are represented by a great number of beautiful little children, all glittering in clothes of gold and silver tissue, with wings of painted feathers fixed to their shoulders. When the machine is set in motion, all these wheels move round, and the different choirs of angels continue in a constant flutter, singing hallelujahs round the Trinity and the Virgin during the whole of the procession, and are said to make a most beautiful appearance. This is all I could learn of this singular show, neither were we admitted to see the machine; conscious, I suppose, of the ridicule of which it is susceptible, they did not choose to unveil so sacred an object to the eyes of heretics. This island has ever been famous for the celebration of its feasts, even in ancient as well as modern times. They spare no expense; and as they have a large share both of superstition and invention, they never fail to produce something either very fine or very ridiculous. The feast of St Rosalia at Palermo is said to be the finest show in Europe, and costs that city every year a large sum. They assure us there is more taste and magnificence displayed in it, than in any thing of the kind in Italy; and advise us by all means to attend it, as it happens some time near the middle of summer, when we shall probably be in that end of the island.

If you please, we shall now take leave of Messina: \* I did not expect to make so much out of it. But it would not be fair neither, without at least putting you in mind of the great veneration it has ever been held in by the rest of Sicily, for the assistance it gave to Count Rugiero in freeing the island from the yoke of the Saracens; in consideration of which, great privileges were granted it by the succeeding kings; some of which are said still to remain. It was here that the Normans landed; and this city, by the policy of some of its own inhabitants, was the first conquest they made; after which their victorious arms were soon

pointed out—truly a profound gulf; whence the currents of the frith, so prodigiously destructive to ships; these being sucked in by sweeping whirlpools, and often engulfed and wrecked, their fragments passing to the Tauromitan shore," &c.]

"Est igitur Charybdis (says Sallust) mare periculosum nautis; quod contrariis fluctuum cursibus, collisionem facit, et rapta, quoque absorbet."

["Therefore is Charybdis a point of the sea perilous to vessels, hurrying them into collision by the conflicting courses of its waves, and often swallowing them up when it has drawn them to it."]

But these are moderate indeed when compared to the descriptions of the poets.

\* [At the time of Mr Brydone's visit, Messina was in a very poor state, and the number of its inhabitants was not above 25,000. A few years later (1783), it was brought still lower in consequence of an earthquake of unusual violence, which destroyed half the buildings in the city. Since then it has revived. Its being a station of British troops during the last war, tended greatly to improve its condition. Its commerce is now considerable, and the inhabitants are now probably four times more numerous than in 1770.]

extended over the whole island, and a final period put to the Saracen tyranny. Count Rugiero fixed the seat of government at Palermo, and put the political system of the island upon a solid basis, of which the form (and the form alone) still remains to this day. He divided the whole island into three parts; one he gave to his officers, another to the church, and a third he reserved for himself. Of these three branches he composed his parliament, that respectable body, of which the skeleton only now exists; for it has long ago lost all its blood, nerves, and animal spirits; and for many ages past has been reduced to a perfect *caput mortuum*. The superstitious tyranny of Spain has not only destroyed the national spirit of its own inhabitants, but likewise that of every other country which has fallen under its power. Adieu. Ever yours.

P. S.—Apropos! There is one thing I had almost forgot, and I never should have forgiven myself. Do you know the most extraordinary phenomenon in the world is often observed near to this place? I laughed at it at first as you will do, but I am now convinced of its reality; and I am persuaded, too, that if ever it had been thoroughly examined by a philosophical eye, the natural cause must long ago have been assigned.

It has often been remarked, both by the ancients and moderns, that in the heat of summer, after the sea and air have been much agitated by the winds, and a perfect calm succeeds, there appears, about the time of dawn, in that part of the heavens over the straits, a great variety of singular forms, some at rest, and some moving about with great velocity. These forms, in proportion as the light increases, seem to become more aerial, till at last, some time before sunrise, they entirely disappear.

The Sicilians represent this as the most beautiful sight in nature: Leanti, one of their latest and best writers, came here on purpose to see it. He says the heavens appeared crowded with a variety of objects: he mentions palaces, woods, gardens, &c., besides the figures of men and other animals that appear in motion amongst them. No doubt, the imagination must be greatly aiding in forming this aerial creation; but as so many of their authors, both ancient and modern, agree in the fact, and give an account of it from their own observation, there certainly must be some foundation for the story. There is one Giardini, a Jesuit, who has lately written a treatise on this phenomenon, but I have not been able to find it: the celebrated Messinese Gallo has likewise published something on this singular subject; if I can procure either of them in the island, you shall have a more perfect account of it. The common people, according to custom, give the whole merit to the devil; and indeed it is by much the shortest and easiest way of accounting for it. Those who pretend to be philosophers, and refuse him this honour, are greatly puzzled what to make of it. They think it may be owing to some uncommon refraction or reflection of the rays, from the water of the straits, which, as it is at that time carried about in a variety of eddies and vortices, must consequently, say they, make a variety of appearances on any medium where it is reflected. This, I think, is nonsense, or at least very near it; and till they can say more to the purpose, I think they had much better have left it in the hands of the old gentleman. I suspect it is something of the nature of our aurora borealis, and like many of the great phenomena of nature, depends upon electrical causes; which, in future ages, I have little doubt, will be found to be as powerful an agent in regulating the universe, as gravity is in this age, or as the subtle fluid was in the last.

The electrical fluid, in this country of volcanoes, is probably produced in a much greater quantity than in any other. The air, strongly impregnated with this matter, and confined betwixt two ridges of mountains—at the same time exceedingly agitated from below by the violence of the current, and the impetuous whirling of the waters—may it not be supposed

to produce a variety of appearances? And may not the lively Sicilian imaginations, animated by a belief in demons, and all the wild offspring of superstition, give these appearances as great a variety of forms? Remember, I do not say it is so; and hope yet to have it in my power to give you a better account of this matter.\* However, if you should suppose me in this story, or in any future one I may tell you, to be inclined to the fabulous, you will please to remember that I am now in the country of fable; this island having given rise to more, perhaps, except Greece, than all the world beside. You have, therefore, only to suppose that these regions are still contagious; and call to mind that Mount *Ætna* has ever been the great mother of monsters and chimeras, both in the ancient and modern world. However, I shall, if possible, keep free of the infection, and entertain you only with such subjects as fall under my own observation. But, indeed, from what I have already heard of that wonderful mountain, the most moderate account of it would appear highly fabulous to all such as are unacquainted with objects of this kind. Adieu. We think of setting off to-morrow by daybreak. I am sorry it has not been a storm, that we might have had a chance of seeing *Pandemonium* reared over our heads, and all the devils at work around it.

I shall leave this to be sent by the first post, and shall write you again from Catania, if we escape unhurt from all the perils of *Ætna*. Adieu.

\* [The phenomena here described so dubiously are now acknowledged as natural, and are described in science by the term *Fata Morgana*. To the best of our knowledge, they occur nowhere but in the Straits of Messina. The following philosophical account of them is given in the *Conversations Lexicon*, from the *Astronomie Physique* of M. Biot:—"When the rising sun shines from that point whence its incident ray forms an angle of forty-five degrees, on the sea of Reggio, and the bright surface of the water in the bay is not disturbed either by wind or current—when the tide is at its height, and the waters are pressed up by the currents to a great elevation in the middle of the channel; the spectator being placed on an eminence, with his back to the sun, and his face to the sea, the mountains of Messina rising like a wall behind it, and forming the background of the picture—on a sudden there appear in the water, as in a catoptric theatre, various multiplied objects—numberless series of pillars, arches, castles, well delineated regular columns, lofty towers, superb palaces, with balconies and windows, extended alleys of trees, delightful plains, with herds and flocks, armies of men on foot, on horseback, and many other things, in their natural colours and proper actions, passing rapidly in succession along the surface of the sea, during the whole of the short period of time while the above-mentioned causes remain. The objects are proved, by accurate observations of the coast of Reggio, to be derived from objects on shore. If, in addition to the circumstances already described, the atmosphere be highly impregnated with vapour and dense exhalations, not previously dispersed by the action of the wind and waves, or rarefied by the sun, it then happens that, in this vapour, as in a curtain extended along the channel to the height of above forty palms and nearly down to the sea, the observer will behold the scene of the same objects not only reflected on the surface of the sea, but likewise in the air, though not so distinctly or well defined. Lastly, if the air be slightly hazy and opaque, and at the same time dewy, and adapted to form the iris, then the above-mentioned objects will appear only at the surface of the sea, as in the first case, but all vividly coloured or fringed with red, green, blue, or other prismatic colours." It will be observed from this account that the optical principle of reflection is alone concerned in the phenomena, and that Mr Brydone is wrong in his surmise of an electrical cause. Another class of phenomena, which pass under the name of *mirage*, and by which distant objects are brought into view on the verge of the horizon, are produced by refraction, in consequence of a difference of density (the result of heat) in two strata of the atmosphere—being thus identical with the common wonder of water poured into a bowl to make a shilling at the bottom rise into observation. *Mirage* often takes place in great sandy plains in tropical countries, as Persia, Egypt, and Mexico.]

## RUINS OF TAUROMINUM.

*Giardini, near Taurominum, May 22.*

WE have had a delightful journey, and if all Sicily be but as agreeable, we shall not repent of our expedition. We left Messina early this morning, with six mules for ourselves and servants, and two for our baggage. This train, I assure you, makes no contemptible appearance; particularly when you call to mind our front and rear guard, by far the most conspicuous part of it. These are two great drawcansir figures, armed cap-à-pie, with a broad hanger, two enormous pistols, and a long arquebuss: this they kept cocked and ready for action in all suspicious places; where they recounted abundance of wonderful stories of robberies and murders, some of them with such very minute circumstances, that I am fully persuaded they themselves were the principal actors. However, I look upon our situation as perfectly secure; they pay us great respect, and take the utmost pains that we shall not be imposed upon. Indeed, I think they impose upon every body except us; for they tax the bills according to their pleasure; and such cheap ones I never paid before. To-day's dinner for eleven men, (our three muleteers included), and feeding for ten mules and horses, did not amount to half-a-guinea; and although we pay them high (an ounce a-day each), yet I am persuaded they save us at least one-half of it on our bills. They entertained us with some of their feats, and make no scruple of owning their having put several people to death; but add, "*Mas tutti, tutti honorabilmente*"—that is to say, they did not do it in a dastardly manner, nor without just provocation.

The sea-coast of Sicily is very rich; the sides of some of the mountains are highly cultivated, and present the most agreeable aspect that can be imagined—corn, wine, oil, and silk, all mixed together, and in the greatest abundance. However, the cultivated part is but small in proportion to what is lying waste, and only serves to show the great fertility of this island, were it peopled and in industrious hands. The sides of the road are covered with a variety of flowers and of flowering shrubs, some of them exceedingly beautiful. The enclosures are many of them fenced with hedges of the Indian fig, or prickly pear, as in Spain and Portugal; and our guides assure us, that in many of the parched ravines round *Ætna*, there are plenty of trees which produce both cinnamon and pepper; not so strong, they allow, as those of the spice islands, but which are sold to the merchants at a low price, by a set of banditti who dress themselves like hermits. These spices are mixed with the true pepper and cinnamon from the Indies, and sent over all Europe.

The road from Messina to this place is extremely romantic. It lies the whole way along the coast, and commands the view of Calabria, and the south part of the straits, covered with chebecs, galleys, galliots, and a quantity of fishing-boats. The view on the right hand is confined by high mountains, on the very summits of which they have built several considerable towns and villages, which, with their churches and steeples, make a very picturesque appearance. They have chosen this elevated situation, I suppose, with a double view—to protect them both from their enemies, and from the violent heat of the climate. This forenoon we found it excessive, but had the finest swimming in the world before dinner, which kept us cool and fresh for all the rest of the day. We have besides provided ourselves with umbrellas, without which, at this season, travelling would be impracticable.

Between this place and Messina, a little to the right, lie the mountains formerly called the *Nebrodes*; and likewise the mountain of *Neptune*, which is reckoned the highest of that chain. It is celebrated for a gulf or crater on its summit, from whence, at particular times, there issues an exceeding cold wind, with such

violence that it is difficult to approach it. I was sorry to pass this singular mountain, but it would have delayed us a day or two to visit it, and we are hastening with impatience to a much greater object: it is now named *Il monte Scudero*, and is said to be so high that the *Adriatic* can be seen from its summit. From the description they give of it, it appears evidently to be an old volcano. The *Nisso* takes its rise from this mountain—a river renowned in antiquity for the gold found in its channel, for which reason it was by the Greeks called *Chrysothoas*. It is said that the remains of the ancient gold mines are still to be seen near the source of this river; but the modern masters of Sicily have never been enterprising enough to explore them. It was on this charming coast where the flocks of *Apollo* were kept by his daughters, *Phæthusa* and *Lampetie*; the seizing of which, by *Ulysses'* companions, proved the cause of their deaths, and of all his subsequent misfortunes. The mountain of *Tauromina* is very high and steep, and the road up to it is exceedingly rugged.

This once famous city is now reduced to an insignificant borough; yet even these small remains give a high idea of its former magnificence. The theatre, I think, is accounted the largest in the world. It appears to me greatly superior to that of *Adrian's villa* near *Rome*. It is entire enough to give a very tolerable idea of the Roman theatre, and indeed astonishes by its vastness; nor can I perceive how any voice would extend through the prodigious number of people it must have contained. I paced about one quarter of it, over the boxes that were intended for the women, which is not near the outward circle of all; the rest is so broken that I could get no farther. It measured about 120 ordinary steps, so that you may conceive the greatness of the whole. The seats front *Mount Ætna*, which makes a glorious appearance from this place, and no doubt has often diverted their attention from the scene. It arises from an immense base, and mounts equally on all sides to its summit. It is just now throwing out volumes of white smoke, which do not rise in the air, but seem to roll down the side of the mountain like a vast torrent. The ascent of *Ætna* on each side is computed at about 30 miles, and the circumference of its base at 150. I think it does not appear to be so much; but I shall probably be enabled to give you a fuller account of it afterwards.

After admiring the great theatre of *Taurominum*, we went to examine the *Naumachia*, and the reservoirs for supplying it with water. About 150 paces of one side of the wall of the *Naumachia* remains; but as this is not complete, there is no judging of its original dimensions. This is supposed to have been a large square, enclosed with strong walls, and capable of being filled with water on occasion, intended for the exhibition of sea-fights and all naval exercises. There were four reservoirs for supplying this with water. All are upon the same grand scale. One of these is almost entire; it is supported by a great number of strong pillars in the same manner as those of *Titus's baths* at *Rome*, and several others you may have seen in Italy. I would dwell longer on objects of this kind, but I am persuaded descriptions can give but a very imperfect idea of them; and to mark out the precise dimensions with a mathematical exactness, where there is nothing very remarkable, must surely be but a dry work, both to the writer and reader. I shall therefore content myself (I hope it will content you too) with endeavouring to communicate, as entire as possible, the same impression I myself shall receive, without descending too much to particulars, or fatiguing myself or you with the mensuration of antique walls, merely because they are such, except where there is indeed something both striking and different from what has already been described in Italy.

I own I despair of success; few things I believe in writing being more difficult than thus *s'emparer de l'imagination*—to seize, to make ourselves masters of

the reader's imagination, to carry it along with us through every scene, and make it in a manner congenial with our own—every prospect opening upon him with the same light, and arising in the same colours, and at the same instant, too, as upon us; for where descriptions fail in this, the pleasure of reading them must be very trivial. Now, perhaps, this same journal style is the most favourable of any to produce these effects. It is at least the most agreeable to the writer, who never has his subject to seek, but needs only recollect what has passed since he has laid down the pen, and travel the day over again; and if he travels it to good purpose, it ought to be equally agreeable to the reader, too, who thereby becomes one of the party, and bears a share in all the pleasures of the journey, without suffering from the fatigues of it.

One of my great difficulties, I see, will be the finding proper places to write in, for the inns are altogether execrable, and there is no such thing as getting a room to one's self. I am just now writing on the end of a barrel, which I chose rather than the table, as it is farther removed from noise. I must therefore entreat you, once for all, to excuse incorrectness and want of method. How can one be methodical upon a barrel? It has ever been the most declared enemy to method. You might as well expect a sermon from Bacchus, or a coherent speech from our friend Lord — after he has finished the third bottle. You will be pleased, then, just to take things as they occur. Were I obliged to be strictly methodical, I should have no pleasure in writing you these letters; and then, if my position is just, you could have no pleasure in reading them.

Your guards have procured us beds, though not in the town of Taurominum, but in Giardini, a village at the foot of the mountain on which it stands. The people are extremely attentive, and have procured us an excellent supper and good wine, which now waits—but shall wait no longer. Adieu. To-morrow we intend to climb Mount *Ætna* on this (its east) side, if we find it practicable. Ever yours.

#### ASCENT OF MOUNT *ÆTNA*.

*Catania, May 24.*

I AM already almost two days in arrears. Yesterday we were so much fatigued with the abominable roads of Mount *Ætna*, that I was not able to wield a pen; and to-day, I assure you, has by no means been a day of rest; however, I must not delay any longer, otherwise I shall never be able to make up my *læ* way. I am afraid you will suffer more from the fatigues of the journey than I at first apprehended.

We left Giardini at five o'clock. About half a mile farther the first region of Mount *Ætna* begins, and here they have set up the statue of a saint, for having prevented the lava from running up the mountain of Taurominum, and destroying the adjacent country; which the people think it certainly must have done, had it not been for this kind interposition; but he very wisely, as well as humanely, conducted it down a low valley to the sea.

We left the Catania road on the left, and began to ascend the mountain in order to visit the celebrated tree, known by the name of *Il Castagno de Cento Cavalli* (the chestnut-tree of a hundred horse), which, for some centuries past, has been looked upon as one of the greatest wonders of *Ætna*. We had likewise proposed, if possible, to gain the summit of the mountain by this side, and to descend by the side of Catania; but we were soon convinced of the impossibility of this, and obliged, with a good deal of reluctance, to relinquish this part of our scheme.

As we advanced in the first region of *Ætna*, we observed that there had been eruptions of fire all over this country at a great distance from the summit, or

principal crater of the mountain. On our road to the village of Piedmonte, I took notice of several very considerable craters, and stones of a large size scattered all around, that had been discharged from them. These stones are precisely such as are thrown out of the crater of Mount Vesuvius; and indeed the lava, too, seems to be of the same nature, though rather more porous.

The distance from Giardini to Piedmonte is only ten miles; but as the road is exceedingly rough and difficult, we took near four hours to travel it. The barometer, which at Giardini (on the sea-side) stood at 29 inches 10 lines, had now fallen to 27 inches 3 lines. Fahrenheit's thermometer (made by Mr Adams in London) stood at 73 degrees. We found the people extremely inquisitive to know our errand, which, when we told, many of them offered to accompany us. Of these we chose two; and after drinking our tea, which was matter of great speculation to the inhabitants, who had never before seen a breakfast of this kind, we began to climb the mountain.

We were directed for five or six miles of our road by an aqueduct, which the Prince of Palagonia has made at a great expense, to supply Piedmonte with water. After we left the aqueduct, the ascent became a good deal more rapid, till we arrived at the beginning of the second region, called by the natives *La Regione Sylvoso*, or the woody region, because it is composed of one vast forest that extends all around the mountain. Part of this was destroyed by a very singular event, not later than the year 1755. During an eruption of the volcano, an immense torrent of boiling water issued, as is imagined, from the great crater of the mountain, and in an instant poured down to its base, overwhelming and ruining every thing it met with in its course. Our conductors showed us the traces of the torrent, which are still very visible, but are now beginning to recover verdure and vegetation, which for some time appeared to have been lost. The track it has left seems to be about a mile and a half broad, and in some places still more.

The common opinion, I find, is, that this water was raised by the power of suction, through some communication betwixt the volcano and the sea, the absurdity of which is too glaring to need a refutation. The power of suction alone, even supposing a perfect vacuum, could never raise water to more than thirty-three or thirty-four feet, which is equal to the weight of a column of air the whole height of the atmosphere. But this circumstance, I should imagine, might be easily enough accounted for, either by a stream of lava falling suddenly into one of the valleys of snow that occupy the higher regions of the mountain, and melting it down; or, what I think is still more probable, that the melted snow sinks into vast caverns and reservoirs in the mountain, where it is lodged for some time, till the excessive heat of the lava below bursts the sides of these caverns, and produces this phenomenon, which has been matter of great speculation to the Sicilian philosophers, and has employed the pens of several of them. The same thing happened in an eruption of Vesuvius last century, and in an instant swept away about five hundred people, who were marching in procession at the foot of the mountain to implore the mediation of St Januarius.

Near to this place we passed through some beautiful woods of cork and evergreen oak, growing absolutely out of the lava, the soil having as yet hardly filled the crevices of that porous substance; and, not a great way farther, I observed several little mountains that seemed to have been formed by a late eruption. I dismounted from my mule, and climbed to the top of them all. They are seven in number, every one of them with a regular cup or crater on the top; and in some the great gulf or (as they call it) *Voragine*, that had discharged the burnt matter of which these little mountains are formed, is still open. I tumbled stones down into these gulfs, and heard the

noise for a long time after. All the fields round, to a considerable distance, are covered with large burnt stones discharged from these little volcanoes.

From this place it is not less than five or six miles to the great chestnut-trees, through forests growing out of the lava, in several places almost impassable. Of these trees, there are many of an enormous size; but the Castagno de Cento Cavalli is by much the most celebrated. I have even found it marked in an old map of Sicily, published near a hundred years ago; and in all the maps of *Ætna* and its environs it makes a very conspicuous figure. I own I was by no means struck with its appearance, as it does not seem to be one tree, but a bush of five large trees growing together. We complained to our guides of the imposition, when they unanimously assured us, that by the universal tradition and even testimony of the country, all these were once united in one stem; that their grandfathers remembered this when it was looked upon as the glory of the forest, and visited from all quarters; that for many years past it had been reduced to the venerable ruin we beheld. We began to examine it with more attention, and found there was indeed an appearance as if these five trees had really been once united in one. The opening in the middle is at present prodigious, and it does indeed require faith to believe that so vast a space was once occupied by solid timber. But there is no appearance of bark on the inside of any of the stumps, nor on the sides that are opposite to one another. Mr Glover and I measured it separately, and brought it exactly to the same size, namely, 204 feet round. If this was once united in one solid stem, it must with justice, indeed, have been looked upon as a very wonderful phenomenon in the vegetable world, and was deservedly styled the glory of the forest.

I have since been told by the Canonico Recupero, an ingenious ecclesiastic of this place, that he was at the expense of carrying up peasants with tools to dig round the Castagno de Cento Cavalli; and he assures me, upon his honour, that he found all these stems united below ground in one root. I alleged that so extraordinary an object must have been mentioned by many of their writers. He told me that it had, and produced several examples—Philateo, Carrera, and some others. Carrera begs to be excused from telling its dimensions, but says he is sure there was wood enough in that one tree to build a large palace. Their poet Bagolini, too, has celebrated a tree of the same kind, perhaps the same tree;\* and Massa, one of their most esteemed authors, says he has seen solid oaks upwards of forty feet round, but adds, that the size of the chestnut-trees was beyond belief, the hollow of one of which, he says, contained 300 sheep, and thirty people on horseback had often been in it at a time. I shall not pretend to say that this is the same tree he means, or whether it ever was one tree or not. There are many others that are well deserving the curiosity of travellers. One of these, about a mile and a half higher on the mountain, is called *Il Castagno del Galea*; it rises from one solid stem to a considerable height, after which it branches out, and is a much finer object than the other. I measured it about two feet from the ground, and found it seventy-six feet round. There is a third called *Il Castagno del Nave*, that is pretty nearly of the same size. All these grow on a thick rich soil, formed originally, I believe, of ashes thrown out by the mountain.

The climate here is much more temperate than in

\* *Supremos inter montes monstrosior omni*

*Monstrosi fœtum stiptis Ætna dedit*

*Castaneam genit, ejus modo conceva cortex*

*Turram equitum haud parvam continet, atque greges, &c.*

[Of lofty mounts by far the loftiest,

Prodigious *Ætna* bore a wondrous tree—

A chestnut—whose vast hollow may contain

A well-sized band of horse, or flocks, or herds, &c.]

the first region of *Ætna*, where the excessive heats must ever prevent a very luxuriant vegetation. I found the barometer had now fallen to 26 degrees  $5\frac{1}{2}$  lines, which announces an elevation of very near four thousand feet, equivalent, in the opinion of some of the French academicians, to eighteen or twenty degrees of latitude in the formation of a climate.

The vast quantity of nitre contained in the ashes of *Ætna*, probably contributes greatly to increase the luxuriance of this vegetation; and the air, too, strongly impregnated with it from the smoke of the volcano, must create a constant supply of this salt, termed by some, not without reason, the food of vegetables.

There is the ruins of a house in the inside of the great chestnut-tree, which had been built for holding the fruit it bears, which is still considerable; here we dined with excellent appetite, and being convinced that it was in vain to attempt getting to the top of the mountain on that side, we began to descend; and after a very fatiguing journey over old lavas, now become fertile fields and rich vineyards, we arrived about sunset at Jaci Reale, where, with no small difficulty, we at last got lodging in a convent of Dominicans.

The last lava we crossed before our arrival there is of a vast extent. I thought we never should have had done with it; it certainly is not less than six or seven miles broad, and appears in many places to be of an enormous depth.

When we came near the sea, I was desirous to see what form it had assumed in meeting with the water. I went to examine it, and found it had driven back the waves for upwards of a mile, and had formed a large black high promontory, where before it was deep water. This lava, I imagined, from its barrenness, for it is as yet covered with a very scanty soil, had run from the mountain only a few ages ago; but was surprised to be informed by Signior Recupero, the historiographer of *Ætna*, that this very lava is mentioned by Diodorus Siculus to have burst from *Ætna* in the time of the second Punic war, when Syracuse was besieged by the Romans. A detachment was sent from Taorminum to the relief of the besieged. They were stopped on their march by this stream of lava, which having reached the sea before their arrival at the foot of the mountain, had cut off their passage; and obliged them to return by the back of *Ætna*, upwards of one hundred miles about. His authority for this, he tells me, was taken from inscriptions on Roman monuments found on this lava, and that it was likewise well ascertained by many of the old Sicilian authors. Now, as this is about two thousand years ago, one would have imagined, if lavas have a regular progress in becoming fertile fields, that this must long ago have become at least arable; this, however, is not the case; and it is as yet only covered with a very scanty vegetation, and incapable of producing either corn or vines. There are indeed pretty large trees growing in the crevices, which are full of a rich earth; but in all probability it will be some hundred years yet before there is enough of it to render this land of any use to the proprietors.

It is curious to consider, that the surface of this black and barren matter, in process of time, becomes one of the most fertile soils upon earth. But what must be the time to bring it to its utmost perfection, when after two thousand years it is still in most places but a barren rock? Its progress is possibly as follows:—The lava, being a very porous substance, easily catches the dust that is carried about by the wind, which at first, I observe, only yields a kind of moss; this rotting, and by degrees increasing the soil, some small meagre vegetables are next produced, which, rotting in their turn, are likewise converted into soil. But this progress, I suppose, is often greatly accelerated by showers of ashes from the mountain, as I have observed in some places the richest soil, to the depth of five or six feet and upwards; and still below

that, nothing but rocks of lava. It is in these spots that the trees arrive at such an immense size. Their roots shoot into the crevices of the lava, and lay such hold of it, that there is no instance of the winds tearing them up, though there are many of its breaking off their largest branches. A branch of one of the great chestnut-trees, where we passed yesterday, has fallen across a deep gully, and formed a very commodious bridge over the rivulet below. The people say it was done by St Agatha, the guardian saint of the mountain, who has the superintendance of all its operations.

In the lowest part of the first region of *Ætna*, the harvest is almost over; but in the upper parts of the same region, near the confines of the *Regione Sylvosa*, it will not begin for several weeks.

The reapers, as we went along, abused us from all quarters, and more excellent blackguards I have never met with; but, indeed, our guides were a full match for them. They began as soon as we were within hearing, and did not finish till we were got without reach of their voices, which they extended as much as they could. As it was all Sicilian, we could make very little of it, but by the interpretation of our guides; however, we could not help admiring the volubility and natural elocution with which they spoke. This custom is as old as the time of the Romans, and probably much older, as it is mentioned by Horace and others of their authors. It is still in vogue here as much as ever; the masters encourage it; they think it gives them spirits, and makes the work go on more cheerfully; and I believe they are right, for it is amazing what pleasure they seemed to take in it, and what laughing and merriment it occasioned.

I forgot to mention that we passed the source of the famous cold river (*Il fiume freddo*). This is the river so celebrated by the poets in the fable of *Acis* and *Galatea*.\* It was here that *Acis* was supposed to have been killed by *Polyphemus*, and the gods out of compassion converted him into this river, which, as still retaining the terror inspired by the dreadful voice of the Cyclops, runs with great rapidity, and about a mile from its source throws itself into the sea. It rises at once out of the earth a large stream. Its water is remarkably pure, and so extremely cold, that it is reckoned dangerous to drink it; but I am told it has likewise a poisonous quality, which proceeds from its being impregnated with vitriol to such a degree, that cattle have often been killed by it. It never freezes; but, what is remarkable, it is said often to contract a degree of cold greater than that of ice.

These particulars I was informed of by the priests at *Acis*; which place, anciently called *Acis Aquileia*, and several others near it, *Acis Castello*, *Acis Terra*, &c., take their names from the unfortunate shepherd *Acis*.

A little to the east of the river *Acis* is the mouth of the river *Alcantara*, one of the most considerable in the island. It takes its rise on the north side of Mount *Ætna*, and marks out the boundary of the mountain for about sixty miles. Its course has been stopped in many places by the eruptions of the volcano; so that, strictly speaking, the skirts of *Ætna* extend much beyond it, though it has generally been considered as the boundary. We passed it on our way

\* [*Acis*, according to heathen fable, was the son of *Faunus* and the nymph *Symæthis*. He fell in love with *Galatea*, and had for his rival *Polyphemus*, who crushed him with a stone. See *Ovid's Metamorphoses*, xlii. The local memorials of this story, enumerated in the text, are very curious: probably, while they seem to an unenlightened mind to establish the veracity of the entire fable, they are only the result of the poetical fictions built upon that fable, or the slight foundation which it may have had in fact, the popular mind being always ready to find a place for any incident, however imaginary, which becomes familiarly known. Already the incidents of the *Lady of the Lake* are all realised, in connexion with certain spots, by the peasantry around Loch *Katrine*.]

to *Piedmonte*, over a large bridge built entirely of lava; and near to this the bed of the river is continued for a great way, through one of the most remarkable, and probably one of the most ancient lavas that ever ran from *Ætna*. In many places the current of the river, which is extremely rapid, has worn down the solid lava to the depth of fifty or sixty feet. *Recupero*, the gentleman I have mentioned, who is engaged in writing the natural history of *Ætna*, tells me he has examined this lava with great attention, and he thinks that its course, including all its windings, is not less than forty miles. It issued from a mountain on the north side of *Ætna*, and finding some valleys that lay to the east, it took its course that way, interrupting the *Alcantara* in many places, and at last arrived at the sea, not far from the mouth of that river.

The city of *Jaci*, or *Acis*, and indeed all the towns on this coast, are founded on immense rocks of lava, heaped one above another, in some places to an amazing height; for it appears that these flaming torrents, as soon as they arrived at the sea, were hardened into rock, which not yielding any longer to the pressure of the liquid fire behind, the melted matter continuing to accumulate, formed a dam of fire, which in a short time run over the solid front, pouring a second torrent into the ocean; this was immediately consolidated, and succeeded by a third, and so on.

Many of the places on the coast still retain their ancient names; but the properties ascribed to them by the ancients are now no more. The river *Acis*, which is now so poisonous, was of old celebrated for the sweetness and salubrity of its waters;\* which *Theocritus* says were ever held sacred by the Sicilian shepherds.

We were surprised to find that so many places retained the name of this swain, who, I imagined, had never existed but in the imagination of the poets: but the Sicilian authors say, that *Acis* was the name of a king who reigned in this part of the island in the time of the most remote antiquity, in confirmation of which, *Massa* gives the translation of an inscription found near *Acis Castello*.† He is said to have been slain in a fit of jealousy by *Polyphemus*, one of the giants of *Ætna*, which gave rise to the fable. *Anguillara*, a Sicilian poet, in relating this story, gives a tremendous idea of the voice of *Polyphemus*: the passage has been greatly admired.

Tremo per troppo horrore *Ætna*; e Tifeo  
Fece maggior la fiamma uscir del monte;  
E Pacchino, e Peloro, e Lilibeo  
Quasi attuffar nel mar l'altra fronte;  
Cadde il martel di man nel monte *Etneao*,  
All Re di Lenno, a Sterope, e a Bronte;  
Fugir fiere et augel di lor ricetto  
E si strinse ogni madre il figlio al Petto.‡

\* *Quique per Ætneos Acis petit æquora fines,  
Et dulci gratum Nereida perliit unda.—Sil. Ital.*  
[*Acis* through *Ætna's* bounds that seeks the ocean-waves,  
And with its waters sweet the grateful *Nereid* laves.]

† *DIE*  
OONIS, SATURNIE, ÆTNEÆ  
DEORUM,  
MARTI, FILLE, UXORI,  
IN PORTU  
SEPULCHRUM, TEMPLUM, ET ARCEM  
ACIS,  
FAUNI FILIUS, PICI NEPOS,  
SATURNI PRONEPOS,  
LATINI FRATER.

[Few scholars would probably agree in the interpretation of this inscription, which we therefore leave unattempted, begging the reader to console himself with the reflection that it is but a silly forgery of comparatively late times, got up by some Sicilian with the *Æneid* before him, for the patriotic purpose of making out *Acis* to be the "great-grandson of Saturn."]

‡ [The parallel passage in *Virgil* will give nearly the sense of the Sicilian verses, and is as follows:—

And now the goddess, exercised in ill, \*\*\*

You will observe, however, that the Sicilian poet cannot in justice claim the entire merit of these lines, as they are evidently borrowed from Virgil's description of the sound of the Fury Alecto's horn, in the 7th Æneid. The last line, perhaps the most beautiful of the whole, is almost word for word:—

Et trepidæ matres pressere ad pectora natos.

[And frighted mothers closely clasped their young.]

It has been observed, too, by some critics, that even this description of Virgil is not his own, but copied from the account that Apollonius Rhodius gives of the roaring of the dragon that guarded the golden fleece; so that you see there is nothing new under the sun. Rhodius probably stole it from somebody else, and so on. Poets have ever been the greatest of all thieves; and happy it is that poetical theft is no felony, otherwise, I am afraid, Parnassus would have been but thinly peopled.

Farewell: to-morrow I shall endeavour to bring you up with us; for at present you will please to observe, that you have got no farther than the city of Jaci, and have still many extinguished volcanoes to pass before your arrival here. Ever yours, &c.

~~~~~  
LAVAS AROUND ÆTNA.

Catania, May 25.

THE road from Jaci to this city is entirely over lava, and consequently very fatiguing and troublesome. Within a few miles of that place, we counted eight mountains formed by eruption, with every one its crater, from whence the burnt matter was discharged. Some of these are very high, and of a great compass. It appears evidently that the eruptions of Mount Ætna have formed the whole of the coast, and in many places have driven back the sea for several miles from its ancient boundary. The account the Sicilian authors give of the conflict betwixt these two adverse elements is truly tremendous; and in relating it, they seem to have been shaken with horror. Conceive the front of a torrent of fire, ten miles in breadth, and heaped up to an enormous height, rolling down the mountain, and pouring its flames into the ocean. The noise, they assure us, is infinitely more dreadful than the loudest thunder, and is heard through the whole country to an immense distance. The water seemed to retire and diminish before the fire, and to confess its superiority, yielding up its possessions, and contracting its banks, to make room for its imperious master, who commands it—"Thus far shalt thou come, and no farther." The clouds of salt vapour darken the face of the sun, covering up this scene under a veil of horror and of night, and laying waste every field and vineyard in these regions of the island. The whole fish on the coast are destroyed, the colour of the sea itself is changed, and the transparency of its waters lost for many months.

There are three rocks of lava at some little distance from shore, which Pliny takes frequent notice of, and calls them the *Three Cyclops*. It is pretty singular that they are still distinguished by the same name.

The fate of Catania has been very remarkable, and will ever appear fabulous. It is situated immediately at the foot of this great volcano, and has been several times destroyed by it. That, indeed, is not extraordinary; it would have been much more so had it es-

caped; but what I am going to relate is a singularity that probably never happened to any city but itself. It was always in great want of a port, till by an eruption in the sixteenth century, and, no doubt, by the interposition of St Agatha, what was denied them by nature they received from the generosity of the mountain. A stream of lava, running into the sea, formed a mole which no expense could have furnished them. This lasted for some time a safe and commodious harbour, till at last, by a subsequent eruption, it was entirely filled up and demolished; so that probably the poor saint had sunk much in her credit, for, at this unfortunate period, her miraculous veil, looked upon as the greatest treasure of Catania, and esteemed an infallible remedy against earthquakes and volcanoes, seems to have lost its virtue. The torrent burst over the walls, sweeping away the images of every saint that was placed there to oppose it, and, laying waste great part of this beautiful city, poured into the sea. However, the people say that at that time they had given their saint very just provocation, but that she has long ago been reconciled to them, and has promised never to suffer the mountain to get the better of them for the future. Many of them are so thoroughly convinced of this (for they are extremely superstitious), that I really believe if the lava were at their walls they would not be at the pains to remove their effects. Neither is it the veil of St Agatha alone that they think possessed of this wonderful dominion over the mountain, but every thing that has touched that piece of sacred attire they suppose is impregnated in a lesser degree with the same miraculous properties. Thus there are a number of little bits of cotton and linen fixed to the veil, which, after being blessed by the bishop, are supposed to acquire power enough to save any person's house or garden; and wherever this expedient has failed, it is always ascribed to the want of faith of the person, not any want of efficacy in the veil. However, they tell you many stories of these bits of cotton being fixed to the walls of houses and vineyards, and preserving them entirely from the conflagration.

On our arrival at Catania, we were amazed to find that in so noble and beautiful a city there was no such thing as an inn. Our guides, indeed, conducted us to a house they called such; but it was so wretchedly mean and dirty, that we were obliged to look out for other lodgings; and by the assistance of the Canonico Recupero, for whom we had letters, we soon found ourselves comfortably lodged in a convent. The Prince of Biscaris (the governor of the place) a person of very great merit and distinction, returned our visit this forenoon, and made us the most obliging offers.

Signior Recupero, who obligingly engages to be our Cicerone, has shown us some curious remains of antiquity; but they have been all so shaken and shattered by the mountain, that hardly any thing is to be found entire.

Near to a vault, which is now thirty feet below ground, and has probably been a burial-place, there is a draw-well, where there are several strata of lavas, with earth to a considerable thickness over the surface of each stratum. Recupero has made use of this as an argument to prove the great antiquity of the eruptions of this mountain. For, as it requires two thousand years or upwards to form a scanty soil on the surface of a lava, there must have been more than that space of time betwixt each of the eruptions which have formed these strata. But what shall we say of a pit they sunk near to Jaci, of a great depth? They pierced through seven distinct lavas, one under the other, the surfaces of which were parallel, and most of them covered with a thick bed of rich earth. Now, says he, the eruption which formed the lowest of these lavas, if we may be allowed to reason from analogy, must have flowed from the mountain at least 14,000 years ago.

Ascends the roof, and to her crooked horn \* \* \*  
Adds all her breath. The rocks and woods around,  
And mountains, tremble at the infernal sound.  
The sacred lake of Trivis from afar,  
The Veline fountains, and sulphureous Nar,  
Shake at the baleful blast, the signal of the war.  
Young mothers wildly stare, with fear possess'd,  
And strain their helpless infants to their breast.]

Recupero tells me he is exceedingly embarrassed by these discoveries in writing the history of the mountain; that Moses hangs like a dead weight upon him, and blunts all his zeal for inquiry; for that really he has not the conscience to make his mountain so young as that prophet makes the world. What do you think of these sentiments from a Roman Catholic divine? The bishop, who is strenuously orthodox—for it is an excellent see—has already warned him to be upon his guard, and not to pretend to be a better natural historian than Moses, nor to presume to urge any thing that may in the smallest degree be deemed contradictory to his sacred authority.\* Adieu. Ever yours.

~~~~~

CATANIA.—CATHOLIC SUPERSTITIONS.

*Catania, May 26.*

THIS morning we went to see the house and museum of the Prince of Biscaris, which, in antiques, is inferior to none I have ever seen, except that of the King of Naples at Portici. What adds greatly to the value of these is, that the prince himself has had the satisfaction of seeing the most of them brought to light. He has dug them out of the ruins of the ancient theatre of Catania at an incredible expense; but, happily, his pains have been amply repaid by the number and variety of curious objects he has discovered. It would be endless to enter into an enumeration of them; even during our short stay, we had the satisfaction of seeing part of a rich Corinthian cornice, and several pieces of statues, produced again to the light, after lying for so many ages in darkness and oblivion. His collection of medals, cameos, and intaglios, is likewise very princely, and so are the articles in natural history; but the polite and amiable behaviour of the owner gives more pleasure than all his curiosities. He did not ostentatiously, like the Prince of Villa Franca, tell us that his house and carriages were at our command; but without any hint being given of it, we found his coach waiting at our door; and we shall probably be obliged to make use of it during our stay. His family consists of the princess his wife, a son, and a daughter, who seem to emulate each other in benignity. They put me in mind of some happy families I have seen in our own country, but resemble nothing we have met with on the continent. He is just now building a curious villa on a promontory formed by the lava of 1669. The spot where the house stands was formerly at least fifty feet deep of water, and the height of the lava above the present level of the sea is not less than fifty more.

This afternoon I walked out alone to examine the capricious forms and singular appearances that this

\* [This passage has been the subject of much severe comment. That Mr Brydone, in putting into a whimsical light many of the religious superstitions of the countries through which he travelled, was incautious respecting the essential things of religion, is very evident: it was an error into which a young man of sprightly talents and thorough devotion to natural science was then very apt to fall. The passage also shows incautiousness in point of science. It was pointed out in Dodsley's Annual Register (xviii. p. 134), that there must be great differences in the rapidity of the growth of soil above lava in different places; that, in a low place like that spoken of in the text, the washing effect of rains would be apt to create a stratum of earth in a comparatively short time; and that Mr Brydone himself admits, in the passage respecting Mel Passi, that a lava surface was "soon" made fertile by a shower of ashes from the volcano. We are fortunately not called upon to argue the question seriously, as geological inquiries of a more profound nature have now established the age of the world as much beyond what the above circumstances in their greatest latitude would infer, while it is alike clearly shown that the supposition of its age being about 6000 years is nowhere directly affirmed by Moses.]

destructive branch has assumed in laying waste the country. I had not gone far when I spied a magnificent building at some distance, which seemed to stand on the highest part of it. My curiosity led me on, as I had heard no mention of any palace on this side of the city. On entering the great gate, my surprise was a good deal increased on observing a façade almost equal to that of Versailles, a noble staircase of white marble, and every thing that announced a royal magnificence. I had never heard that the kings of Sicily had a palace at Catania, and yet I could not account for what I saw in any other way. I thought the vast front before me had been the whole of the palace; but conceive my amazement, when, on turning the corner, I found another front of equal greatness, and discovered that what I had seen was only one side of a square.

I was no longer in doubt, well knowing that the church alone could be mistress of such magnificence. I hastened home to communicate this discovery to my friends, when I found the Canonico Recupero already with them. He abused us exceedingly for presuming to go out without our Cicerone, and declared he had never been so much disappointed in his life, as he had come on purpose to carry us there, and to enjoy our surprise and astonishment. He then told us that it was no other than a convent of fat Benedictine monks, who were determined to make sure of a paradise, at least in this world, if not in the other. He added that they were worth about £15,000 a-year—an immense sum, indeed, for this country.

We went with Recupero to pay our respects to these sons of humility, temperance, and mortification; and we must own they received and entertained us with great civility and politeness, and even without ostentation. Their museum is little inferior to that of the Prince of Biscaris, and the apartments that contain it are much more magnificent. But their garden is the greatest curiosity; although it be formed on the rugged and barren surface of the lava, it has a variety and a neatness seldom to be met with. The walks are broad, and paved with flints; and the trees and hedges (which, by the bye, are in a bad state, and cut into a number of ridiculous shapes) thrive exceedingly. The whole soil must have been brought from a great distance, as the surface of this lava (only 150 years old) is as hard and bare as a piece of iron. The church belonging to this convent, if finished, would be one of the finest in Europe; but as it is founded on the surface of the porous and brittle lava, part of the foundation has given way to the pressure of so huge a fabric; and several of the large arches that were intended to form the different chapels, have already fallen down. Only the west limb of the cross (not a fifth of the whole) is finished, and even this alone makes a very fine church. Here they have the finest organ I ever heard, even superior, I think, to that at Haerlem.

We went next to examine where the lava had sealed the walls of Catania. It must have been a noble sight. The walls are sixty-four palms high (near sixty feet), and of great strength, otherwise they must have been borne down by the force of the flaming matter which rose over this height, and seems to have mounted considerably above the top of the wall before it made its entry; at last it came down, sweeping before it every saint in the calendar, who were drawn up in order of battle on purpose to oppose its passage, and marching on in triumph, annihilated, in a manner, every object that dared to oppose it. Amongst other things, it covered up some fine fountains, one of which was so much esteemed, that they have at a great expense pierced through the lava, and have now recovered their favourite spring. This excavation is a very curious work, and worthy of the attention of travellers.

Catania is looked upon as one of the most ancient cities in the island, or indeed in the world. Their legends bear, that it was founded by the Cyclops, or

giants of *Ætna*, supposed to have been the first inhabitants of Sicily after the Deluge; and some of the Sicilian writers pretend that it was built by Deucalion and Pyrrha as soon as the waters subsided, and they had got down again to the foot of the mountain. Its ancient name was *Catetna*, or the city of *Ætna*.

It is now reckoned the third city in the kingdom, though, since Messina was destroyed by the plague, it may well be considered as the second. It contains upwards of thirty thousand inhabitants, has a university, the only one in the island, and a bishopric. The bishop's revenues are considerable, and arise principally from the sale of the snow on Mount *Ætna*, one small portion of which, lying on the north of the mountain, is said to bring him in upwards of £1000 a-year; for *Ætna* furnishes snow and ice not only to the whole island of Sicily, but likewise to Malta, and a great part of Italy, and makes a very considerable branch of commerce; for even the peasants in these hot countries regale themselves with ices during the summer heats, and there is no entertainment given by the nobility of which these do not always make a principal part: a famine of snow, they themselves say, would be more grievous than a famine of either corn or wine. It is a common observation amongst them, that without the snows of Mount *Ætna* their island could not be inhabited, so essential has this article of luxury become to them. But *Ætna* not only keeps them cool in summer, but likewise keeps them warm in winter; the fuel for the greatest part of the island being carried from the immense and inexhaustible forests of this volcano, and constitutes, too, a very large branch of commerce. But this amazing mountain perpetually carries me away from my subject: I was speaking of this city. What of it was spared by the eruption of 1669, was totally ruined by the fatal earthquake in 1693, when the greater part of its inhabitants were buried under the walls of their houses and churches. Yet, after such repeated and such dismal disasters, so strange is their infatuation, that they could never be prevailed upon to change its situation. The whole city was soon rebuilt, after a new and elegant plan, and is now much handsomer than ever. There is scarce any doubt that in some future commotion of the mountain, it will be again laid in ashes. But at present they are in perfect security; the Virgin and St Agatha have both engaged to protect them; and under their banner they hold *Ætna*, with all the devils it contains, at defiance.

There are many remains of antiquity in this city, but indeed most of them are in a very ruinous state. One of the most remarkable is an elephant of lava, with an obelisk of Egyptian granite on his back. There are likewise considerable remains of a great theatre, besides the one belonging to the Prince of Biscaris; a large bath almost entire; the ruins of the great aqueduct, eighteen miles long; the ruins of several temples, one of Ceres, another of Vulcan; the church called *Bocca di Fuoco* was likewise a temple. But the most entire of all is a small rotundo, which, as well as the Pantheon at Rome, and some others to be met with in Italy, in my opinion demonstrates that form to be the most durable of any.

It has now been purged and purified from all the infection contracted from heathen rites, and is become a Christian church, dedicated to the blessed Virgin, who has long been constituted universal legatee and executrix to all the ancient goddesses, celestial, terrestrial, and infernal; and, indeed, little more than the names are changed, the things continuing pretty much the same as ever. The Catholics themselves do not attend to it, but it is not a little curious to consider, how small is the deviation in almost every article of their present rites from those of the ancients. I have somewhere seen an observation, which seems to be a just one, that during the long reign of heathenism, superstition had altogether exhausted her talent for invention, so that when a superstitious spirit seized

Christians, they were under the necessity of borrowing from their predecessors, and imitating some part of their idolatry. This appears to be strictly the case. I took notice of it to Signior *Recupero*, who is not the most zealous sectary in the world, and who frankly owned the truth of the observation.

In some places the very same images still remain: they have only christened them; and what was *Venus* or *Proserpine*, is now *Mary Magdalene* or the *Virgin*. The same ceremonies are daily performed before these images, in the same language, and nearly in the same manner. The saints are perpetually coming down in person, and working miracles, as the heathen gods did of old. The walls of the temples are covered with the vows of pilgrims, as they were formerly. The holy water, which was held in such detestation by the first Christians, is again revered, and sprinkled about with the same devotion as in the time of Paganism. The same incense is burnt, by priests arrayed in the same manner, with the same grimaces and genuflections, before the same images, and in the same temples, too. In short, so nearly do the rites coincide, that were the Pagan high-priest to come back, and re-assume his functions, he would only have to learn a few new names, to get the *Mass*, the *Paters*, and the *Aves* by heart, which would be much easier to him, as they are in a language he understands, but which his modern successors are often ignorant of. Some things, to be sure, would puzzle him; and he would swear that all the mysteries of *Eleusis* were nothing to the amazing mystery of transubstantiation, the only one that ever attempted to set both our understanding and our senses at defiance, and baffles equally all the faculties both of the soul and body. He would likewise be a good deal at a loss to account for the strange metamorphosis of some of his old friends. That (he would say) I can well remember, was the statue of *Venus Meretrix*, and was only worshipped by the loose and voluptuous. She seems to be wonderfully improved since you made her a Christian, for I find she is now become the great protectress of chastity and of virtue. *Juno*, too, who was so implacable and so revengeful, you have softened down into a very moderate sort of deity, for I observe you address her with as little fear or ceremony as any of the rest of them; I wish you would make the *Furies* Christians, too, for surely they would be much the better for it. But observing the figure of *St Anthony*, he would exclaim with astonishment, But what do I behold!—*Jupiter*, the sovereign of gods and men, with a ragged cloak over his shoulders! What a humiliating spectacle! Well do I remember with what awe we bent before that once respectable image. But what has become of the thunderbolt, which he held in his hand to chastise the world, and what is that he has got in its place? His conductor would tell him that it was only a piece of rope, with knots upon it, to chastise himself; adding, that he was now doing penance for his long usurpation, and that the thunder had long ago been put into better hands. However, he would soon find, that even these saints sometimes change their names, according to the enthusiastic caprice of the people; and from this versatility, he would still be in hopes, in process of time, to see his friend *Jupiter* re-assume his bolt and his dignity.

Do you remember old *Huet*—the greatest of all originals? One day, as he passed the statue of *Jupiter* in the capitol, he pulled off his hat, and made him a bow. A Jacobite gentleman who observed it, asked him why he paid so much respect to that old gentleman. "For the same reason," replied *Huet*, "that you pay so much to the Pretender. Besides," added he, "I think there is rather a greater probability that his turn will come round again than that of your hero; I shall therefore endeavour to keep well with him, and hope he will never forget that I took notice of him in the time of his adversity."

Indeed, within the course of my own observation, I

can recollect some of the most capital saints in the calendar who have been disgraced by the people, and new names given to their statues. When we were in Portugal last war, the people of Castel Branco were so enraged at St Antonio, for allowing the Spaniards to plunder their town, contrary, as they affirmed, to his express agreement with them, that they broke many of his statues to pieces; and one that had been more revered than the rest, they took the head off, and clapped on one of St Francis in its place, whose name the statue ever after retained. Even the great St Januarius himself, I am told, was in imminent danger during the last famine at Naples. A Swiss gentleman assured me, that he had heard them load him with abuse and invective; and declare point-blank, that if he did not procure them corn by such a time, he should no longer be their saint. However, such instances are but rare; and, in general, the poor Catholics are fully indemnified for these sudden fits of passion and resentment, by the full persuasion of the immediate presence and protection of their beloved patrons.

I have observed with pleasure that glow of gratitude and affection that has animated their countenances; and am persuaded that the warmth of the enthusiastic devotion they often feel before their favourite saints, particularly their female ones, must have something extremely delightful in it; resembling, perhaps, the pure and delicate sensations of the most respectful love. I own I have sometimes envied them their feelings, and in my heart cursed the pride of reason and philosophy, with all its cool and tasteless triumphs, that lulls into a kind of stoical apathy these most exquisite sensations of the soul. Who would not choose to be deceived, when the deception raises in him these delicious passions, that are so worthy of the human heart, and for which, of all others, it seems to be the most fitted? But if once you have steeled it over with the hard and impenetrable temper of philosophy, these fine-spun threads of weakness and affection that were so pliable, and so easily tied, become hard and inflexible, and for ever lose that delicate tone of sensibility that puts them into a kind of unison and vibration with every object around us; for what has been so truly said of one part of our species, may almost with equal justice be applied to the whole—

That to their weakness half their charms we owe.

I remember Dr Tissot told me, he had a patient that actually died of love for Christ; and when in the last extremity, seemed still to enjoy the greatest happiness; calling upon him with all the fondness of the most enthusiastic passion. And from what I have often observed before the statues of the Virgin and St Agatha, I am persuaded they have many inamoratos that would willingly lay down their lives for them.

Now, pray, don't you think too, that this personal kind of worship is much better adapted to the capacities of the vulgar than the more pure and sublime modes of it, which would only distract and confound their simple understandings, unaccustomed to speculation, and that certainly require something gross and material, some object of sense, to fix their attention? This even seems to have been the opinion of some of the sacred writers, who often represent God under some material form.

Were you to attempt to give a country fellow an idea of the Deity—were you to tell him of a being that is immaterial, and yet whose essence penetrates all matter—who has existed from all eternity, and whose extension is equally boundless with his duration—who fills and pervades millions of worlds, and animates every object they contain—and who, in the sublime language of our poet,

Though changed through all, is yet in all the same,  
Great in the earth as in the ethereal frame;  
Warms in the sun, refreshes in the breeze,  
Glow in the stars, and blossoms in the trees;

Lives through all life, extends through all extent;

Spreads undivided, operates unspent.

To him no high, no low, no great, no small;

He fills, he bounds, connects, and equals all.

Now, what do you imagine he would think of such a being? I am afraid his understanding would be so bewildered that he could not think at all. But set up before him the figure of a fine woman, and a beautiful child in her arms, the most interesting object in nature, and tell him she can procure him every thing he wants, he knows perfectly well what he is about, feels himself animated by the object, and prays to her with all his might.

Adieu. We are going to be very busy, and are preparing every thing for one of the greatest objects of our expedition, the examination of Mount *Ætna*. Indeed, we have received but bad encouragement, and are beginning to doubt of the possibility of success. *Recupero* tells us that the season is not far enough advanced yet, by some months, and that he does not think it will be possible to get near the summit of the mountain. The last winter, he says, was so uncommonly severe, that the circle of snow extended much nearer the foot of the mountain than usual; that, although this circle is now greatly contracted, it still extends nine or ten miles below the crater. He advises us to return this way in the month of August; and, if possible, make *Ætna* the last part of our expedition. It we do not succeed to-morrow, we shall probably follow his advice; but we are all determined to make a bold push for it. The weather is the most favourable that can be imagined; here is a delightful evening, and by the star-light we can observe the smoke rolling down the side of the mountain like a vast torrent. *Recupero* says this is a sure indication of the violence of the cold in these exalted regions of the atmosphere, which condenses the vapour, and makes it fall down the moment it issues out of the crater. He advises us, by all means, to provide plenty of liquors, warm fur cloaks, and hatchets to cut wood, as we shall probably be obliged to pass the night in the open air, in a climate, he assures us, as cold as that of Greenland. It is very singular if this be true, for at present we are melting with heat, in thin suits of taffeta. Adieu. You shall know it all on our return, if we do not share the fate of *Empedocles*. Ever yours.

#### REGIONS OF *ÆTNA*.—ERUPTIONS.

*Catania, May 29.*

On the 27th, by daybreak, we set off to visit Mount *Ætna*, that venerable and respectable father of mountains. His base and his immense declivities are covered over with a numerous progeny of his own, for every great eruption produces a new mountain; and, perhaps, by the number of these, better than by any other method, the number of eruptions, and the age of *Ætna* itself, might be ascertained.

The whole mountain is divided into three distinct regions, called *La Regione Culta* or Piedmontese, the fertile region; *La Regione Sylvoosa* or *Nemorosa*, the woody region; and *La Regione Deserta* or *Scoperta*, the barren region.

These three are as different, both in climate and productions, as the three zones of the earth; and perhaps, with equal propriety, might have been styled the torrid, the temperate, and the frigid zone. The first region surrounds the foot of the mountain, and constitutes the most fertile country in the world on all sides of it, to the extent of about fourteen or fifteen miles, where the woody region begins. It is composed almost entirely of lava, which, after a number of ages, is at last converted into the most fertile of all soils.

At *Nicolosi*, which is twelve miles up the mountain, we found the barometer at 27 degrees  $1\frac{1}{2}$  lines; at

Catania it stood at 29 degrees 8½ lines: although the former elevation is not very great, probably not exceeding three thousand feet, yet the climate was totally changed. At Catania the harvest was entirely over, and the heats were insupportable; here they were moderate, and in many places the corn is as yet green. The road for these twelve miles is the worst I ever travelled; entirely over old lavas and the mouths of extinguished volcanoes, now converted into corn-fields, vineyards, and orchards.

The fruit of this region is reckoned the finest in Sicily, particularly the figs, of which they have a great variety. One of these, of a very large size, esteemed superior in flavour to all the rest, they pretend is peculiar to *Ætna*.

The lavas, which, as I have already said, form this region of the mountain, take their rise from an infinite number of the most beautiful little mountains on earth, which are every where scattered on the immense declivity of *Ætna*. These are all of a regular figure; either that of a cone, or a semisphere; and all but a very few are covered with beautiful trees, and the richest verdure: every eruption generally forms one of these mountains. As the great crater of *Ætna* itself is raised to such an enormous height above the lower regions of the mountain, it is not possible that the internal fire, raging for a vent, even round the base, and no doubt vastly below it, should be carried to the height of twelve or thirteen thousand feet, for probably so high is the summit of *Ætna*. It has therefore generally happened, that after shaking the mountain and its neighbourhood for some time, it at last bursts open its side, and this is called an eruption. At first it only sends forth a thick smoke and showers of ashes, that lay waste the adjacent country; these are soon followed by red-hot stones and rocks of a great size, thrown to an immense height in the air. The fall of these stones, together with the quantities of ashes discharged at the same time, at last form the spherical and conical mountains I have mentioned. Sometimes this process is finished in the course of a few days, sometimes it lasts for months, which was the case in the great eruption 1669. In that case, the mountain formed is of a great size; some of them are not less than seven or eight miles round, and upwards of one thousand feet in perpendicular height; others are not more than two or three miles round, and three or four hundred feet high.

After the new mountain is formed, the lava generally bursts out from its lower side, and bearing every thing before it, is for the most part terminated by the sea. This is the common progress of an eruption; however, it sometimes happens, though rarely, that the lava bursts at once from the side of the mountain without all these attending circumstances; and this is commonly the case with the eruptions of Vesuvius, where the elevation being so much smaller, the melted matter is generally carried up into the crater of the mountain, which then exhibits the phenomena I have described; discharging showers of stones and ashes from the mouth of the volcano without forming any new mountain, but only adding considerably to the height of the old one, till at last the lava, rising near the summit, bursts the side of the crater, and the eruption is declared. This has literally been the case with two eruptions I have been an attentive witness of in that mountain; but *Ætna* is upon a much larger scale, and one crater is not enough to give vent to such oceans of liquid fire.

Recupero assures me he saw in an eruption of that mountain, large rocks of fire discharged to the height of some thousand feet, with a noise much more terrible than that of thunder. He measured from the time of their greatest elevation till they reached the ground, and found they took twenty-one seconds to descend; which, according to the rule of the spaces, being as the squares of the times, amounts, I think, to upwards of seven thousand feet—a most astonish-

ing height surely, and requiring a force of projection beyond what we have any conception of. I measured the height of the explosions of Vesuvius by the same rule, and never observed any of the stones thrown from it to take more than nine seconds to descend, which shows they had risen to little more than twelve hundred feet.

Our landlord at Nicolosi gave us an account of the singular fate of the beautiful country near Hybla, at no great distance from hence. It was so celebrated for its fertility, and particularly for its honey, that it was called *Mel Passi*, till it was overwhelmed by the lava of *Ætna*; and having then become totally barren, by a kind of pun, its name was changed to *Mal Passi*. In a second eruption, by a shower of ashes from the mountain, it soon re-assumed its ancient beauty and fertility, and for many years was called *Bel Passi*. Last of all, in the unfortunate era of 1669, it was again laid under an ocean of fire, and reduced to the most wretched sterility, since which time it is known again by its second appellation of *Mal Passi*. However, the lava in its course over this beautiful country, has left several little islands or hillocks, just enough to show what it formerly was. These make a singular appearance, in all the bloom of the most luxuriant vegetation, surrounded and rendered almost inaccessible by large fields of black and rugged lava. The mountain from whence the first eruption issued that covered *Mel Passi*, is known by the name of *Monpelieri*: I was struck with its beautiful appearance at a distance, and could not resist the desire I had of examining it minutely, as well as of observing the effects of the two eruptions that overwhelmed this celebrated country.

*Monpelieri* is rather of a spherical than a conical shape, and does not rise in perpendicular height above three hundred feet, but it is so perfectly regular on every side, and so richly overspread with fruits and flowers, that I could not leave so heavenly a spot without the greatest regret. Its cup or crater is large in proportion to the mountain, and is as exactly hollowed out as the best made bowl. I walked quite round its outward edge, and think the circumference must be somewhat more than a mile.

This mountain was formed by the first eruption that destroyed the country of *Mel Passi*, and is of a very old date. It buried a great number of villages and country houses, and particularly two noble churches, which are more regretted than all the rest, on account of three statues, reckoned at that time the most perfect in the island. They have attempted, but in vain, to recover them, as the spot where the churches stood could never be justly ascertained. Indeed, it is impossible it should; for these churches were built of lava, which it is well known is immediately melted when it comes into contact with a torrent of new erupted matter; and *Massa* says, that in some eruptions of *Ætna*, the lava has poured down with such a sudden impetuosity, that, in the course of a few hours, churches, palaces, and villages, have been entirely melted down, and the whole run off in fusion, without leaving the least mark of their former existence. But if the lava has had any considerable time to cool, this singular effect never happens.

The great eruption of 1669, after shaking the whole country around for four months, and forming a very large mountain of stones and ashes, burst out about a mile above *Monpelieri*, and descending like a torrent, bore directly against the middle of that mountain, and (they pretend) perforated it from side to side; this, however, I doubt, as it must have broken the regular form of the mountain, which is not the case. But certain it is that it pierced it to a great depth. The lava then divided into two branches, and surrounding this mountain, joined again on its south side; and laying waste the whole country betwixt that and Catania, scaled the walls of that city, and poured its flaming torrent into the ocean. In its way, it is said to have destroyed the possessions of near

thirty thousand people, and reduced them to beggary. It formed several hills where there were formerly valleys, and filled up a large lake, of which there is not now the least vestige to be seen.

As the events of this eruption are better known than any other, they tell a great many singular stories of it, one of which, however incredible it may appear, is well ascertained. A vineyard, belonging to a convent of Jesuits, lay directly on its way. This vineyard was formed on an ancient lava, probably a thin one, with a number of caverns and crevices under it. The liquid lava entering into these caverns, soon filled them up, and by degrees bore up the vineyard; and the Jesuits, who every moment expected to see it buried, beheld with amazement the whole field begin to move off. It was carried on the surface of the lava to a considerable distance, and though the greater part was destroyed, yet some of it remains to this day.

We went to examine the mouth from whence this dreadful torrent issued, and were surprised to find it only a small hole, of about three or four yards diameter. The mountain from whence it sprung, I think, is little less than the conical part of Vesuvius.

There is a vast cavern on the opposite side of it, where people go to shoot wild pigeons, which breed there in great abundance. The innermost parts of this cavern are so very dismal and gloomy, that our landlord told us some people had lost their senses from having advanced too far, imagining they saw devils and the spirits of the damned; for it is still very generally believed here that *Ætna* is the mouth of hell.

We found a degree of wildness and ferocity in the inhabitants of this mountain that I have not observed any where else. It put me in mind of an observation the Padre della Torre (the historiographer of Mount Vesuvius) told me he had often made in the confines of Naples—that in the places where the air is most impregnated with sulphur and hot exhalations, the people were always most wicked and vicious. Whatever truth there may be in the observation, the people about Nicolosi at least seem to confirm it. The whole village flocked round us, and the women, in particular, abused us exceedingly, the cause of which we at last found was, that Fullarton's blooming complexion and white skin had made them take him for one of their own sex. They made a great clamour, and it was with difficulty we could appease them. The person whom Recupero had appointed to accompany us, known by the name of the Cyclops (the man in the island that is best acquainted with Mount *Ætna*), was ordered by them not to go with us; and if we had not at last obtained their consent by soothing and flattery, the best method with women, he durst not have disobeyed them. At first we had been obliged to shut the gate of the court, they were so very noisy and tumultuous; but when our landlord (a priest), for whom we had letters from Catania, assured them that we were Christians, and came with no bad intentions, they became more moderate, and we ventured out amongst them. This confidence soon acquired theirs; and in a short time we became good friends, and had a great deal of conversation.

It was with much difficulty I could persuade them that we were not come to search for hidden treasures, a great quantity of which they believe is to be found in Monpelieri; and when I went to that mountain they were then fully convinced that this was our intention. Two of the men followed me, and kept a close eye on every step that I took; and when I lifted any bit of lava or pumice, they came running up, thinking it was something very precious; but when they observed they were only bits of stone, and that I put them into my pocket, they laughed heartily, talking to one another in their mountain jargon, which is unintelligible even to Italians. However, as most of them speak Italian so as to be understood, they asked me what I was going to make of these bits of stone? I told them they were of great value in our

country; that the people there had a way of making gold of them; at this they both seemed exceedingly surprised, and spoke again in their own tongue. However, I found they did not believe me; one of them told me if that had been true I certainly would not have been so ready in telling it; but, said he, if it is so, we will serve you for ever if you will teach us that art, for then we shall be the richest people on earth. I assured them that I had not yet learned it myself, and that it was a secret known only to very few. They were likewise a good deal surprised to see me pull out of my pocket a magnetical needle and a small electrometer, which I had prepared at Catania to examine the electrical state of the air; and I was at first afraid they should have taken me for a conjuror (which you know already happened among the Apennines), but luckily that idea did not strike them.

On our way back to Nicolosi we were joined by three or four more, with their wives. I began to be a little afraid of myself, lest they should insist on knowing the secret. However, I took out my bits of lava, and told them they were at their service, if they had any occasion for them. But they refused them, saying, they wished to the Virgin and St Agatha, that I could take away the whole of it, as it had ruined the finest country in all Sicily.

One fellow, who assumed an air of superior wisdom and dignity to the rest, made them form a circle round him, and began to interrogate me with great gravity and composure. It was with difficulty I could keep my countenance; but as I was alone with them, at some distance from the village, I was afraid of offending. He desired me to answer him with truth and precision, what were the real motives of our coming so fatiguing and disagreeable a journey. I told him, on my word, that we had no other motive but curiosity to examine Mount *Ætna*. On which, laughing to one another with great contempt, "*Un bel ragione questo, non è vero?*" said they—(A very pretty reason, truly.) The old fellow then asked me what country we were of. I told him we were Inglese. "*E dov' è loro paese?*" said he—(Whereabouts does their country lie?) I told him it was a great way off, on the other side of the world. "*Da vero,*" said the fellow; "*e credono in Christo quelli Inglese?*"—[Do these English believe in Christ?] I told him, laughing, that they did. "Ah!" said he, shaking his head, "*mi pare che non credono troppo.*"—[I suppose they don't believe too much.] One of the company then observed, that he remembered several of these Inglese that had paid visits to Mount *Ætna*, and that they never yet could find out their motive; but that he recollected very well to have heard many of their old people say, that the Inglese had a queen that had burnt in the mountain for many years past, and that they supposed these visits were made from some devotion or respect to her memory. I assured them that the Inglese had but too little respect for their queens when they were alive, and that they never troubled themselves about them after they were dead; however, as all the others confirmed this testimony, I thought it best to say little against it; but I was extremely curious to know who this queen might be. They alleged that I knew much better than they, but added that her name was Anna.

I could not conceive what Queen Anne had done to bring her there, and was puzzling myself to find it out, when one of them soon cleared up the matter; he told me she was wife to a king that had been a Christian, and that she had made him a heretic, and was in consequence condemned to burn for ever in Mount *Ætna*. In short, I found it was no other than poor Anne Boleyn. As soon as I mentioned the name, "*Si, signor,*" said the fellow; "*l'istessa, l'istessa, la conosce meglio che noi.*"—[Yes, sir, the self-same—you know her better than we.] I asked if her husband was there too, for that he deserved it much better than she. "Certainly," said he, "and all his heretic subjects, too; and if you are of that number, you need not be

in such a hurry to get thither, you will be sure of it at last." I thanked him, and went to join our company, not a little amused with the conversation.

We soon after left Nicolosi, and in an hour and a half's travelling, over barren ashes and lava, we arrived on the confines of the *Regione Sylvoosa*, or the temperate zone. As soon as we entered these delightful forests, we seemed to have got into another world. The air, which before was sultry and hot, was now cool and refreshing; and every breeze was loaded with a thousand perfumes, the whole ground being covered over with the richest aromatic plants. Many parts of this region are surely the most heavenly spots upon earth; and if *Ætna* resembles hell within, it may with equal justice be said to resemble paradise without.

It is indeed a curious consideration, that this mountain should re-unite every beauty and every horror; and, in short, all the most opposite and dissimilar objects in nature. Here you observe a gulf, that formerly threw out torrents of fire, now covered with the most luxuriant vegetation, and from an object of terror become one of delight. Here you gather the most delicious fruit, rising from what was but lately a black and barren rock. Here the ground is covered with every flower; and we wander over these beauties, and contemplate this wilderness of sweets, without considering that hell, with all its terrors, is immediately under our feet, and that but a few yards separate us from lakes of liquid fire and brimstone.

But our astonishment still increases on casting our eyes on the higher regions of the mountain. There we behold in perpetual union the two elements that are at perpetual war—an immense gulf of fire, for ever existing in the midst of snows which it has not power to melt, and immense fields of snow and ice, for ever surrounding this gulf of fire, which they have not power to extinguish.

The woody region of *Ætna* ascends for about eight or nine miles, and forms a zone or girdle of the brightest green all around the mountain. This night we passed through little more than the half of it, arriving sometime before sunset at our lodgings, which was no other than a large cave, formed by one of the most ancient and venerable lavas. It is called *La Spelonca del Capriole*, or the Goats' Cavern, because frequented by those animals, who take refuge there in bad weather.

Here we were delighted with the contemplation of many grave and beautiful objects; the prospect on all sides is immense; and we already seemed to be lifted up from the earth, and to have got into a new world.

Our cavern is surrounded by the most stately and majestic oaks, of the dry leaves of which we made very comfortable beds; and with our hatchets, which we had brought on purpose, we cut down great branches, and in a short time had a fire large enough to roast an ox. I observed my thermometer, and found, from 71 degrees at Nicolosi, it had now fallen below 60 degrees. The barometer stood at 24 degrees 2 lines. In one end of our cave we still found a great quantity of snow, which seemed to be sent there on purpose for us, as there was no water to be found. With this we filled our tea-kettle, as tea and bread and butter was the only supper we had provided, and probably the best one to prevent us from being overcome by sleep or fatigue.

Not a great way from this cavern, are two of the most beautiful mountains of all that number that spring from *Ætna*. I mounted one of our best mules, and with a good deal of difficulty arrived at the summit of the highest of them, just a little before sunset. The prospect of Sicily, with the surrounding sea and all its islands, was wonderfully noble. The whole course of the river *Semetus*, the ruins of *Hybla*, and several other ancient towns, the rich corn-fields and vineyards on the lower region of the mountain, and the amazing number of beautiful mountains below, made a delightful scene. The hollow craters of these

two mountains are each of them considerably larger than that of *Vesuvius*. They are now filled with stately oaks, and covered to a great depth with the richest soil. I observed that this region of *Ætna*, like the former, is composed of lava; but this is now covered so deep with earth, that it is nowhere to be seen but in the beds of the torrents. In many of these it is worn down by the water to the depth of fifty or sixty feet, and in one of them still considerably more. What an idea does not this give of the amazing antiquity of the eruptions of this mountain?

As soon as it was dark, we retired to our cave, and took possession of our bed of leaves. Our rest, however, was somewhat disturbed by the noise of a mountain that lay a good way off on our right. It discharged quantities of smoke, and made several explosions like heavy cannon at a distance; but what is singular, we could observe no appearance of fire. This mountain was formed by an eruption in 1766, now upwards of four years ago, the fire of which is not yet extinguished, neither is the lava by any means cold. This lava spent its fury on a beautiful forest, which it laid waste to the extent of a good many miles. In many places it has run into gulleys of a great depth, which it has filled up to the height, we are told, of two hundred feet. It is in these places where it retains the greatest heat. On our road to-day, we scrambled up this lava, and went a considerable way over its surface, which appeared perfectly cold; but it is certain that in many places it still emits volumes of smoke, particularly after rain; and the people say, what I can readily believe, that this will continue to be the case for some years, where the lava is thickest. A solid body of fire some hundreds of feet thick, and of so great an extent, must certainly retain its heat for many years. The surface, indeed, soon becomes black and hard, and encloses the liquid fire within, in a kind of solid box, excluding all impressions from the external air or from the weather. Thus I have seen, many months after eruptions of Mount *Vesuvius*, a bed of lava, though only of a few feet thick, has continued red hot in the centre long after the surface was cold, and a stick thrust into its crevices instantly took fire, although there was no perceptible heat without.

Massa, a Sicilian author of credit, says he was at Catania eight years after the great eruption in 1669, and that he still found the lava in many places was not cold: but there is an easy method of calculating the time that bodies take to cool. Sir Isaac Newton, I think, in his account of the comet of 1680, supposes the times to be as the squares of their diameters; and finding that a solid ball of metal of two inches, made red-hot, required upwards of an hour to become perfectly cold, made the calculation from that to a body of the diameter of the earth, and found it would require upwards of twenty thousand years. If this rule be just, you may easily compute the time that the lava will take to become thoroughly cold; and that you may have time to do so, I shall here break off my letter, which I am obliged to write in bed, in a very awkward and disagreeable posture, the cause of which shall be explained to you in my next. Adieu. Ever yours.

~~~~~  
SUMMIT OF ÆTNA.

*Catania, May 29, at night.*

AFTER getting a comfortable nap on our bed of leaves in the *Spelonca del Capriole*, we awoke about eleven o'clock, and melting down a sufficient quantity of snow, we boiled our tea-kettle, and made a hearty meal, to prepare us for the remaining part of our expedition.

We were nine in number, for we had our three servants, the Cyclops (our conductor), and two men to take care of our mules. The Cyclops now began to display his great knowledge of the mountain, and we

followed him with implicit confidence. He conducted us over "antres vast and deserts wild," where scarce human foot had ever trod. Sometimes through gloomy forests, which by daylight were delightful, but now, from the universal darkness, the rustling of the trees, the heavy dull bellowing of the mountain, the vast expanse of ocean stretched at an immense distance below us, inspired a kind of awful horror. Sometimes we found ourselves ascending great rocks of lava, where, if our mules should make but a false step, we might be thrown headlong over the precipice. However, by the assistance of the Cyclops, we overcame all these difficulties; and he managed matters so well, that in the space of two hours we found we had got above the regions of vegetation, and had left the forests of *Ætna* far behind. These appeared now like a dark and gloomy gulf below us that surrounded the mountain.

The prospect before us was of a very different nature: we beheld an expanse of snow and ice that alarmed us exceedingly, and almost staggered our resolution. In the centre of this, but still at a great distance, we descried the high summit of the mountain, rearing its tremendous head, and vomiting out torrents of smoke. It indeed appeared altogether inaccessible, from the vast extent of the fields of snow and ice that surrounded it. Our diffidence was still increased by the sentiments of the Cyclops. He told us it often happened that the surface of the mountain being hot below, melted the snow in particular spots, and formed pools of water, where it was impossible to foresee our danger; that it likewise happened that the surface of the water, as well as the snow, was sometimes covered with black ashes, that rendered it exceedingly deceitful; that, however, if we thought proper, he would lead us on with as much caution as possible. Accordingly, after holding a council of war, which you know people generally do when they are very much afraid, we detached our cavalry to the forest below, and prepared to climb the snows. The Cyclops, after taking a great draught of brandy, desired us to be of good cheer, that we had plenty of time, and might take as many rests as we pleased; that the snow could be little more than seven miles, and that we certainly should be able to pass it before sunrise. Accordingly, taking each of us a dram of liqueur, which soon removed every objection, we began our march.

The ascent for some time was not steep, and as the surface of the snow sunk a little, we had tolerable good footing; but as it soon began to grow steeper, we found our labour greatly increased: however, we determined to persevere, calling to mind in the midst of our labour that the Emperor Adrian, and the philosopher Plato, had undergone the same, and from the same motive, too, to see the rising sun from the top of *Ætna*. After incredible labour and fatigue, but at the same time mixed with a great deal of pleasure, we arrived before dawn at the ruins of an ancient structure, called *Il Torre del Filosofo*, supposed to have been built by the philosopher Empedocles, who took up his habitation here the better to study the nature of Mount *Ætna*. By others it is supposed to be the ruins of a temple of Vulcan, whose shop all the world knows (where he used to make excellent thunderbolts and celestial armour, as well as nets to catch his wife when she went astray) was ever kept in Mount *Ætna*. Here we rested ourselves for some time, and made a fresh application to our liqueur bottle, which I am persuaded both Vulcan and Empedocles, had they been here, would have greatly approved of after such a march.

I found the mercury had fallen to 20 degrees 6 lines. We had now time to pay our adorations in a silent contemplation of the sublime objects of nature. The sky was clear, and the immense vault of the heavens appeared in awful majesty and splendour. We found ourselves more struck with veneration than below, and at first were at a loss to know the cause, till we ob-

served with astonishment that the number of stars seemed to be infinitely increased, and the light of each of them appeared brighter than usual. The whiteness of the milky way was like a pure flame that shot across the heavens, and with the naked eye we could observe clusters of stars that were invisible in the regions below. We did not at first attend to the cause, nor recollect that we had now passed through ten or twelve thousand feet of gross vapour, that blunts and confuses every ray, before it reaches the surface of the earth. We were amazed at the distinctness of vision, and exclaimed together, "What a glorious situation for an observatory! Had Empedocles had the eyes of Galileo, what discoveries must he not have made!" We regretted that Jupiter was not visible, as I am persuaded we might have discovered some of his satellites with the naked eye, or at least with a small glass which I had in my pocket. We observed a light a great way below us on the mountain, which seemed to move amongst the forests; but whether an *ignis fatuus*, or what it was, I shall not pretend to say. We likewise took notice of several of those meteors called falling stars, which still appeared to be as much elevated above us as when seen from the plain; so that in all probability those bodies move in regions much beyond the bounds that some philosophers have assigned to our atmosphere.

After contemplating these objects for some time, we set off, and soon after arrived at the foot of the great crater of the mountain. This is of an exact conical figure, and rises equally on all sides. It is composed solely of ashes and other burnt materials, discharged from the mouth of the volcano, which is in its centre. This conical mountain is of a very great size: its circumference cannot be less than ten miles. Here we took a second rest, as the greatest part of our fatigue still remained. The mercury had fallen to 20 degrees 4½ lines. We found this mountain excessively steep, and although it had appeared black, yet it was likewise covered with snow, but the surface (luckily for us) was spread over with a pretty thick layer of ashes thrown out from the crater. Had it not been for this, we never should have been able to get to the top, as the snow was every where frozen hard and solid, from the piercing cold of the air.

In about an hour's climbing, we arrived at a place where there was no snow; and where a warm and comfortable vapour issued from the mountain, which induced us to make another halt. Here I found the mercury at 19 degrees 6½ lines. The thermometer was fallen three degrees below the point of congelation, and before we left the summit of *Ætna*, it fell two degrees more, namely to 27. From this spot it was only about three hundred yards to the highest summit of the mountain, where we arrived in full time to see the most wonderful and most sublime sight in nature.

But here description must ever fall short, for no imagination has dared to form an idea of so glorious and so magnificent a scene. Neither is there on the surface of this globe any one point that unites so many awful and sublime objects. The immense elevation from the surface of the earth, drawn, as it were, to a single point, without any neighbouring mountain for the senses and imagination to rest upon, and recover from their astonishment in their way down to the world. This point, or pinnacle, raised on the brink of a bottomless gulf as old as the world, often discharging rivers of fire, and throwing out burning rocks, with a noise that shakes the whole island. Add to this, the unbounded extent of the prospect, comprehending the greatest diversity and the most beautiful scenery in nature, with the rising sun advancing in the east, to illuminate the wondrous scene.

The whole atmosphere by degrees kindled up, and showed dimly and faintly the boundless prospect around. Both sea and land looked dark and confused, as if only emerging from their original chaos, and light and darkness seemed still undivided, till the morning,

by degrees advancing, completed the separation. The stars are extinguished, and the shades disappear. The forests, which but now seemed black and bottomless gulfs, from whence no ray was reflected to show their form or colours, appear a new creation rising to the sight, catching life and beauty from every increasing beam. The scene still enlarges, and the horizon seems to widen and expand itself on all sides, till the sun, like the great Creator, appears in the east, and with his plastic ray completes the mighty spectacle. All appears enchantment, and it is with difficulty we can believe we are still on earth. The senses, unaccustomed to the sublimity of such a scene, are bewildered and confounded; and it is not till after some time that they are capable of separating and judging of the objects that compose it. The body of the sun is seen rising from the ocean, immense tracks both of sea and land intervening; the islands of Lipari, Panari, Alicudi, Stromboli, and Volcano, with their smoking summits, appear under your feet; and you look down on the whole of Sicily as on a map, and can trace every river through all its windings, from its source to its mouth. The view is absolutely boundless on every side, nor is there any one object within the circle of vision to interrupt it, so that the sight is every where lost in the immensity; and I am persuaded it is only from the imperfection of our organs, that the coasts of Africa, and even of Greece, are not discovered, as they are certainly above the horizon. The circumference of the visible horizon on the top of *Ætna*, cannot be less than two thousand miles. At Malta, which is near two hundred miles distant, they perceive all the eruptions from the second region; and that island is often discovered from about one-half the elevation of the mountain; so that at the whole elevation, the horizon must extend to near double that distance, or four hundred miles, which makes eight hundred for the diameter of the circle, and two thousand four hundred for the circumference. But this is by much too vast for our senses, not intended to grasp so boundless a scene. I find, indeed, by some of the Sicilian authors, particularly Massa, that the African coast, as well as that of Naples, with many of its islands, have been discovered from the top of *Ætna*. Of this, however, we cannot boast, though we can very well believe it. Indeed, if we knew the height of the mountain, it would be easy to calculate the extent of its visible horizon; and, *vice versa*, if its visible horizon was exactly ascertained, it would be an easy matter to calculate the height of the mountain. But the most beautiful part of the scene is certainly the mountain itself, the island of Sicily, and the numerous islands lying round it. All these, by a kind of magic in vision, that I am at a loss to account for, seem as if they were brought close round the skirts of *Ætna*, the distances appearing reduced to nothing. Perhaps this singular effect is produced by the rays of light passing from a rarer medium into a denser; which (from a well-known law in optics) to an observer in the rare medium, appears to lift up the objects that are at the bottom of the dense one; as a piece of money placed in a basin appears lifted up as soon as the basin is filled with water.

The Regione Deserta, or the frigid zone of *Ætna*, is the first object that calls your attention. It is marked out by a circle of snow and ice, which extends on all sides to the distance of about eight miles. In the centre of this circle, the great crater of the mountain rears its burning head; and the regions of intense cold and of intense heat seem for ever to be united in the same point. On the north side of the snowy region, they assure us, there are several small lakes that are never thawed; and that in many places, the snow, mixed with the ashes and salts of the mountain, is accumulated to a vast depth: and indeed I suppose the quantity of salts contained in this mountain is one great reason of the preservation of its snows. The Regione Deserta is immediately succeeded by the *Sylvosa*, or the woody region, which forms a circle

or girdle of the most beautiful green, which surrounds the mountain on all sides, and is certainly one of the most delightful spots on earth. This presents a remarkable contrast with the desert region. It is not smooth and even, like the greatest part of the latter; but it is finely variegated by an infinite number of those beautiful little mountains that have been formed by the different eruptions of *Ætna*. All these have now acquired a wonderful degree of fertility, except a very few that are but newly formed; that is, within these five or six hundred years—for it certainly requires some thousands to bring them to their greatest degree of perfection. We looked down into the craters of these, and attempted, but in vain, to number them.

The circumference of this zone or great circle on *Ætna* is not less than seventy or eighty miles. It is every where succeeded by the vineyards, orchards, and corn-fields, that compose the Regione Culta, or the fertile region. This last zone is much broader than the others, and extends on all sides to the foot of the mountain. Its whole circumference, according to Recupero, is 183 miles. It is likewise covered with a number of little conical and spherical mountains, and exhibits a wonderful variety of forms and colours, and makes a delightful contrast with the other two regions. It is bounded by the sea to the south and south-east, and on all its other sides by the rivers Semetus and Alcantara, which run almost round it. The whole course of these rivers is seen at once, and all their beautiful windings through these fertile valleys, looked upon as the favourite possession of Ceres herself, and the very scene of the rape of her daughter Proserpine.

Cast your eyes a little farther, and you embrace the whole island, and see all its cities, rivers, and mountains, delineated in the great chart of nature: all the adjacent islands, the whole coast of Italy, as far as your eye can reach, for it is nowhere bounded, but every where lost in the space. On the sun's first rising, the shadow of the mountain extends across the whole island, and makes a large track visible even in the sea and in the air. By degrees this is shortened, and in a little time is confined only to the neighbourhood of *Ætna*.

We now had time to examine a fourth region of this wonderful mountain, very different, indeed, from the others, and productive of very different sensations, but which has undoubtedly given being to all the rest—I mean the region of fire.

The present crater of this immense volcano is a circle of about three miles and a half in circumference. It goes shelving down on each side, and forms a regular hollow like a vast amphitheatre. From many places of this space issue volumes of sulphureous smoke, which, being much heavier than the circumambient air, instead of rising in it, as smoke generally does, immediately on its getting out of the crater, rolls down the side of the mountain like a torrent, till coming to that part of the atmosphere of the same specific gravity with itself, it shoots off horizontally, and forms a large track in the air, according to the direction of the wind, which, happily for us, carried it exactly to the side opposite to that where we were placed. The crater is so hot that it is very dangerous, if not impossible, to go down into it; besides, the smoke is very inconvenient, and, in many places, the surface is so soft, there have been instances of people sinking down in it, and paying for their temerity with their lives. Near the centre of the crater is the great mouth of the volcano—that tremendous gulf, so celebrated in all ages, looked upon as the terror and scourge both of this and another life, and equally useful to ancient poets or to modern divines, when the Muse or when the Spirit inspires. We beheld it with awe and with horror, and were not surprised that it had been considered as the place of the damned. When we reflect on the immensity of its depth, the vast cells and caverns whence so many lavas have issued; the force of its internal fire to raise

up those lavas to so vast a height, to support as it were in the air, and even to force it over the very summit of the crater, with all the dreadful accompaniments; the boiling of the matter, the shaking of the mountain, the explosions of flaming rocks, &c., we must allow that the most enthusiastic imagination, in the midst of all its terrors, hardly ever formed an idea of a hell more dreadful.\*

It was with a mixture both of pleasure and pain that we quitted this awful scene. But the wind had risen very high, and clouds began to gather round the mountain. In a short time they formed like another heaven below us, and we were in hopes of seeing a thunderstorm under our feet—a scene that is not uncommon in these exalted regions, and which I have already seen on the top of the high Alps; but the clouds were soon dispelled again by the force of the wind, and we were disappointed in our expectations.

I had often been told of the great effect produced by discharging a gun on the top of high mountains. I tried it here, when we were a good deal surprised to find that, instead of increasing the sound, it was almost reduced to nothing. The report was not equal to that of a pocket-pistol—we compared it to the stroke of a stick on a door; and surely it is consistent with reason, that the thinner the air is the less its impression must be on the ear; for in a vacuum there can be no noise, or no impression can be made; and the nearer the approach to a vacuum the impression must always be the smaller. Where those great effects have been produced, it must have been amongst a number of mountains, where the sound is reverberated from one to the other.

When we arrived at the foot of the cone, we observed some rocks of an incredible size, that have been discharged from the crater. The largest that has been observed from Vesuvius is a round one of about twelve feet diameter. These are much greater; indeed, almost in proportion of the mountains to each other.

On our arrival at the *Torre del Filosofo* we could not help admiring, that the ruins of this structure have remained uncovered for so many ages, so near the top of *Ætna*, when thousands of places at a great distance from it have been repeatedly buried by its lavas in a much shorter time—a proof that few eruptions have risen so high in the mountain.

Empedocles was a native of Agrigentum, and is supposed to have died 400 years before the Christian era. Perhaps his vanity more than his philosophy led him to this elevated situation; nay, it is said to have carried him still much farther:—That he might be looked upon as a god, and that the people might suppose he was taken up to heaven, he is recorded to have thrown himself headlong into the great gulf of Mount *Ætna*, never supposing that his death could be discovered to mankind; but the treacherous mountain threw out his slippers, which were of brass, and announced to the world the fate of the philosopher, who,

\* ["With great fatigue, I at length reached the brink of the crater, and could now look down into the caldron, which shelves gradually to the depth of a hundred feet or so; the circumference being, according to Gemellaro's computation, above two miles. There would thus have no difficulty in walking down into it; but the sulphureous vapour rising from thousands of small openings was an insurmountable obstacle; and yet the guides assured us that the smoke was so inconsiderable that it could not be seen from Catania. In the middle of the bottom of the crater opened many deep black holes, from which issued the thickest smoke. When a gust of wind swept into the caldron, its bottom would for a short moment be cleared, and then displayed a large field of sulphur, strewed over with stones and fragments of lava. The main colour is a decided yellow, which, through innumerable shades, softens into the palest white, or darkens to a red brown. From the side walls, single lava rocks here and there jut out, upon which this play of colours is most apparent. They are covered on the upper side with a coating of sulphur of the liveliest yellow; the shady side passes through a magnificent orange into strong red and a rusty brown."—*Wanderings through Sicily and the Levant: Berlin, 1834.*]

by his death, as well as life, wanted only to impose upon mankind, and make them believe that he was greater than they.

However, if there is such a thing as philosophy on earth, this surely ought to be its seat. The prospect is little inferior to that from the summit, and the mind enjoys a degree of serenity here, that even few philosophers, I believe, could ever boast of on that tremendous point. All nature lies expanded below your feet in her gayest and most luxuriant dress, and you still behold united under one point of view, all the seasons of the year, and all the climates of the earth. The meditations are ever elevated in proportion to the grandeur and sublimity of the objects that surround us; and here, where you have all nature to arouse your admiration, what mind can remain inactive?

It has likewise been observed, and from experience I can say with truth, that on the tops of the highest mountains, where the air is so pure and refined, and where there is not that immense weight of gross vapours pressing upon the body, the mind acts with greater freedom, and all the functions both of soul and body are performed in a superior manner. It would appear that, in proportion as we are raised above the habitations of men, all low and vulgar sentiments are left behind, and that the soul, in approaching the ethereal regions, shakes off its earthly affections, and already acquires something of their celestial purity. Here, where you stand under a serene sky, and behold with equal serenity the tempest and storm forming below your feet—the lightning darting from cloud to cloud, and the thunder rolling round the mountain, and threatening with destruction the poor wretches below—the mind considers the little storms of the human passions as equally below her notice. Surely the situation alone is enough to inspire philosophy, and Empedocles had good reason for choosing it.

But, alas! how vain are all our reasonings! In the very midst of these meditations, my philosophy was at once overset, and in a moment I found myself relapsed into a poor miserable mortal, was obliged to own that pain was the greatest of evils, and would have given the world to have been once more arrived at those humble habitations, which, but a moment before, I had looked down upon with such contempt. In running over the ice, my leg folded under me, and I received so violent a sprain, that in a few minutes it swelled to a great degree, and I found myself unable to put my foot to the ground. Every muscle and fibre was at that time chilled and frozen by the extreme cold, the thermometer continuing still below the point of congelation. It was this circumstance, I suppose, that made the pain so violent, for I lay a considerable time on the ice in great agony; however, in these exalted regions it was impossible to have a horse or a carriage of any kind, and your poor philosopher was obliged to hop on one leg, with two men supporting him, for several miles over the snow; and our wags here allege that he left the greatest part of his philosophy behind him, for the use of Empedocles's heirs and successors.

I was happy to get to my mule; but when I once more found myself on our bed of leaves in the *Splonca del Capriole*, I thought I was in paradise. So true it is, that a removal of pain is the greatest of pleasures. The agony I suffered had thrown me into a profuse sweat and a fever; however, in an instant I fell fast asleep, and in an hour and a half awaked in perfect health. We had an excellent dish of tea, the most refreshing and agreeable I ever drank in all my life.

We left the summit of the mountain about six o'clock, and it was eight at night before we reached Catania. We observed both with pleasure and pain the change of the climate as we descended. From the regions of the most rigid winter, we soon arrived at those of the most delightful spring. On first entering the forests, the trees were still bare as in December, not a single leaf to be seen; but after we

had descended a few miles we found ourselves in the mildest and the softest of climates, the trees in full verdure, and the fields covered with all the flowers of the summer; but as soon as we got out of the woods, and entered the torrid zone, we found the heats altogether insupportable, and suffered dreadfully from them before we reached the city. On the road I saw many mountains which I intended to have visited, but my sprain put it out of my power. One of the most remarkable is called the Monte Pelluse, the lava of which destroyed the great aqueduct of Catania for eighteen miles. It has here and there left a few arches, but nothing of any consequence.

Not far from this mountain stands the Monte Victoria, one of the most beautiful of all the numerous family of *Ætna*. It is of a pretty large size, and perfectly regular, and seems to be in the gayest dress of any. Many of its trees, which at a distance we took to be oranges and citrons, appeared to be in full blow. It was the lava of this mountain that is said to have covered up the port of Ulysses, which is now three miles distant from the sea; but I should suppose this eruption to have been much older than either Ulysses or Troy.

On our arrival at Catania, we went immediately to bed, being exceedingly oppressed by the fatigue of our expedition, but still more by the violent heat of the day—a day in which I think I have enjoyed a greater degree of pleasure and suffered a greater degree of pain than in any other day of my life.

As my leg continues very much swelled, I am still confined to my room, and mostly, indeed, to my bed, from whence I have written you the greater part of these two epistles, the enormous length of which I am ashamed of. However, as I have still omitted several articles that I intended to take notice of, I shall add a sequel to-morrow, and so conclude my account of Mount *Ætna*. Had it not been for this abominable sprain, that holds me fast by the foot, you probably had not got off so easily; but I am obliged to drop all further thoughts of climbing mountains, though there are many things I still wanted to examine. Adieu. Ever yours.

HEIGHT OF *ÆTNA*.—ELECTRICITY.—NATURAL PRODUCTIONS.

*Catania, May 30.*

We took care to regulate two barometers at the foot of the mountain, one of which was left with the Canonico Recupero, and the other we carried along with us. The former, our friend assures us, had no sensible variation during our absence. We both left, and found it at 29 inches  $8\frac{1}{2}$  lines English measure. On our arrival at Catania, the one we carried up with us had risen again exactly to the same point.

I have likewise a good quicksilver thermometer, which I borrowed from the Neapolitan philosopher, the Padre della Torre, who furnished us with letters for this place, and would have accompanied us, could he have obtained leave of the king. It is made by Adams at London, and (as I myself proved) exactly graduated from the two points of freezing and boiling water. It is upon Fahrenheit's scale. I shall mark the heights in the different regions of *Ætna*, with the rules for estimating the elevation of mountains by the barometer, which, I am sorry to say, have been hitherto so very ill ascertained; Cassini, Boguer, and the others who have written on the subject, to the reproach of science, differing so much amongst themselves, that it is with difficulty we can come near the truth.

*Ætna* has been often measured, but I believe never with any degree of accuracy; and it is really a shame to the society established in this place, called the *Ætnean Academy*, whose original institution was to study the nature and operations of this wonderful mountain. It was my full intention to have measured

it geometrically; but I am sorry to say, although this is both the seat of an academy and university, yet there was no quadrant to be had. Of all the mountains I have ever seen, *Ætna* would be the easiest to measure, and with the greatest certainty, and perhaps the most proper place on the globe to establish an exact rule of mensuration by the barometer. There is a beach of a vast extent, that begins exactly at the foot of the mountain, and runs for a great many miles along the coast. The sea-mark of this beach forms the meridian to the summit of the mountain. Here you are sure of a perfect level, and may make the base of your triangle of what length you please. But unfortunately this mensuration has never been executed, at least with a tolerable degree of precision.

Kircher pretends to have measured it, and to have found it 4000 French toises in height, which is more than any of the Andes, or indeed than any mountain upon earth. The Italian mathematicians are still more absurd. Some of them make it eight miles, some six, and some four. Amici, the last, and I believe the best who has made the attempt, reduces it to 3 miles 264 paces; but even this must be exceedingly erroneous; and probably the perpendicular height of *Ætna* does not exceed 12,000 feet, or little more than two miles.\* I shall mark the different methods of determining heights by the barometer, and you may choose which you please. I believe the allowance in all of them, particularly in great elevations, where the air is so exceedingly thin and light, is much too small. Mikeli, whose mensurations are esteemed more exact, has ever found it so. Cassini allows, I think, ten French toises of elevation for every line of mercury, adding one foot to the first ten, two to the second, three to the third, and so on. But surely the weight of the air diminishes in a much greater proportion.

Boguer takes the difference of the logarithms of the height of the barometer in lines (supposing these logarithms to consist only of five figures); from this difference he takes away a thirtieth part, and what remains he supposes to be the difference of elevation. I do not recollect his reason for this supposition; but the rule seems to be still more erroneous than the other, and has been entirely laid aside. I am told, that accurate experiments have been made at Geneva, to establish the mensuration with the barometer, but I have not yet been able to procure them. Mr de la Hire allows twelve toises four feet for the line of mercury; and Picart, one of the most exact French academicians, fourteen toises, or about ninety English feet.

The wind at the summit was so violent that I could

\* [The height of *Ætna* is now believed to be about 10,960 feet. Its surface, calculated by Buffon at 220 square leagues, presents 77 cities, towns, and villages, containing a population of 100,000.]

not make the observation with perfect exactness; however, I am pretty certain that it was within half a line.

I own I did not believe that we should find *Ætna* so high. I had heard, indeed, that it was higher than any of the Alps, but I never gave credit to it. How great, then, was my astonishment to find that the mercury fell almost two inches lower than I had ever observed it on the very highest of the accessible Alps. At the same time, I am persuaded there are many inaccessible points of the Alps (particularly Mont Blanc), that are still much higher than *Ætna*.\*

I found the magnetical needle greatly agitated near the summit of the mountain, (the Padre della Torre told me he had made the same observation on Vesuvius); however, it always fixed at the north point, though it took longer time in fixing than below. But what Recupero told me happened to him was very singular. Soon after the eruption 1755, he placed his compass on the lava. The needle, he says, to his great astonishment, was agitated with much violence for some considerable time, till at last it entirely lost its magnetical power, standing indiscriminately at every point of the compass; and this it never after recovered, till it was again touched with the lodestone.

The wind, and my unfortunate sprain together, in a great measure prevented our electrical experiments, on which we had built not a little; however, I found that round Nicolosi, and particularly on the top of Montpellier, the air was in a very favourable state for electrical operations. Here the little pith-balls, when isolated, were sensibly affected, and repelled each other above an inch. I expected this electrical state of the air would have increased as we advanced on the mountain, but at the cave where we slept, I could observe no such effect. Perhaps it was owing to the exhalations from the trees and vegetables, which are there exceedingly luxuriant, whereas about Nicolosi, and round Montpellier, there is hardly any thing but lava and dry hot sand. Or perhaps it might be owing to the evening being farther advanced, and the dews beginning to fall. However, I have no doubt, that upon these mountains formed by eruption, where the air is strongly impregnated with sulphureous effluvia, great electrical discoveries might be made. And, perhaps, of all the reasons assigned for the wonderful vegetation that clothes this mountain, there is none that contributes so much towards it as this constant electrical state of the air: for, from a variety of experiments it has been found, that an increase of the electrical matter adds much to the progress of vegetation. It probably acts there in the same manner as on the animal body; the circulation we know is performed quicker, and the juices are driven through the small vessels with more ease and celerity. This has often been proved from the immediate removal of obstructions by electricity; and probably the rubbing with dry and warm flannel, esteemed so efficacious in such cases, is doing nothing more than exciting a greater degree of electricity in the part; but it has likewise been demonstrated, by the common experiment of making water drop through a small capillary syphon, which the moment it is electrified runs in a full stream. I have, indeed, very little doubt, that the fertility of our seasons depends as much on this quality in the air, as either on its heats or moisture.

Electricity will probably soon be considered as the great vivifying principle of Nature, by which she carries on most of her operations. It is a fifth element, distinct from, and of a superior nature to the other four, which only compose the corporeal parts of matter: but this subtle and active fluid is a kind of soul that pervades and quickens every particle of it. When an equal quantity of this is diffused through the air, and over the face of the earth, every thing continues

calm and quiet; but if by any accident one part of matter has acquired a greater quantity than another, the most dreadful consequences often ensue before the equilibrium can be restored. Nature seems to fall into convulsions, and many of her works are destroyed: all the great phenomena are produced—thunder, lightning, earthquakes, and whirlwinds; for I believe there is little doubt that all these frequently depend on this sole cause. And again, if we look down from the sublime of nature to its minutia; we shall still find the same power acting, though perhaps in less legible characters; for as the knowledge of its operations is still in its infancy, they are generally misunderstood, or ascribed to some other cause. However, I have no doubt that in process of time these will be properly investigated, when mankind will wonder how much they have been in the dark. It will then possibly be found, that what we call sensibility of nerves, and many of those diseases that the faculty has as yet only invented names for, are owing to the body's being possessed of too large or too small a quantity of this subtle and active fluid—that very fluid, perhaps, that is the vehicle of all our feelings, and which they have so long searched for in vain in the nerves; for I have sometimes been led to think that this sense was nothing else than a slighter kind of electric effect, to which the nerves serve as conductors, and that it is by the rapid circulation of this penetrating and animating fire that our sensations are performed. We all know that in damp and hazy weather, when it seems to be blunted and absorbed by the humidity—when its activity is lost, and little or none of it can be collected—we ever find our spirits more languid, and our sensibility less acute: but in the sirocco wind at Naples, when the air seems totally deprived of it, the whole system is unstrung, and the nerves seem to lose both their tension and elasticity, till the north or west wind awakens the activity of this animating power, which soon restores the tone, and enlivens all nature, which seemed to droop and languish during its absence.

It is likewise well known that there have been instances of the human body becoming electric without the mediation of any electric substance, and even emitting sparks of fire with a disagreeable sensation, and an extreme degree of nervous sensibility.

About seven or eight years ago, a lady in Switzerland was affected in this manner, and though I was not able to learn all the particulars of her case, yet several Swiss gentlemen have confirmed to me the truth of the story. She was uncommonly sensible of every change of weather, and had her electrical feelings strongest in a clear day, or during the passage of thunder-clouds, when the air is known to be replete with that fluid. Her case, like most others which the doctors can make nothing of, was decided to be a nervous one; for the real meaning of that term I take to be only that the physician does not understand what it is.

Two gentlemen of Geneva had a short experience of the same sort of complaint, though still in a much superior degree. Professor Saussure and young Mr Jalabert, when travelling over one of the high Alps, were caught amongst thunder-clouds, and, to their utter astonishment, found their bodies so full of electrical fire, that spontaneous flashes darted from their fingers with a crackling noise, and the same kind of sensation as when strongly electrified by art. This was communicated by Mr Jalabert to the Academy of Sciences at Paris, I think in the year 1763, and you will find it recorded in their Memoirs.

It seems pretty evident, I think, that these feelings were owing to the body's being possessed of too great a share of electric fire. This is an uncommon case, but I do not think it at all improbable that many of our invalids, particularly the hypochondriac, and those we call *malades imaginaires*, owe their disagreeable feelings to the opposite cause, or the body's being pos-

\* [Mont Blanc, now ascertained to be the chief of European mountains, is upwards of 15,000 feet high.]

essed of too small a quantity of this fire; for we find that a diminution of it in the air seldom fails to increase their uneasy sensations, and *vice versa*.

Perhaps it might be of service to these people to wear some electric substance next their skin, to defend the nerves and fibres from the damp or non-electric air. I would propose a waistcoat of the finest flannel, which should be kept perfectly clean and dry, for the effluvia of the body, in case of any violent perspiration, will soon destroy its electric quality: this should be covered by another of the same size, of silk. The animal heat, and the friction that exercise must occasion betwixt these two substances, produce a powerful electricity, and would form a kind of electric atmosphere around the body, that might possibly be one of the best preservatives against the effect of damps.

As for our Swiss lady, I have little doubt that her complaints were owing in great part, perhaps entirely, to her dress; and that a very small alteration, almost in any part of it, would effectually have cured her. A lady who has her head surrounded with wires, and her hair stuck full of metal pins, and who, at the same time, stands upon dry silk, is to all intents and purposes an electrical conductor insulated, and prepared for collecting the fire from the atmosphere; and it is not at all surprising that, during thunder-storms, or when the air is extremely replete with electrical matter, she should emit sparks, and exhibit other appearances of electricity. I imagine a very trifling change of dress, which, from the constant versatility of their modes, may some day take place, would render this lady's disease altogether epidemical amongst the sex. Only let the soles of their shoes be made of an electric substance, and let the wires of their caps, and pins of their hair, be somewhat lengthened and pointed outwards, and I think there is little doubt that they will often find themselves in an electrified state. But, indeed, if they only wear silk, or even worsted stockings, it may sometimes prove sufficient; for I have often insulated electrometers as perfectly by placing them on a piece of dry silk or flannel as on a glass.

How little do our ladies imagine, when they surround their heads with wire, the most powerful of all conductors, and at the same time wear stockings, shoes, and gowns of silk, one of the most powerful repellents, that they prepare their bodies in the same manner, and according to the same principles, as electricians prepare their conductors for attracting the fire of lightning. If they cannot be brought to relinquish their wire caps and their pins, might they not fall upon such preservatives as those which of late years have been applied to objects of less consequence?

Suppose that every lady should provide herself with a small chain or wire, to be hooked on at pleasure during thunder-storms. This should pass from her cap over the thickest part of her hair, which will prevent the fire from being communicated to her head, and so down to the ground. It is plain this will act in the same manner as the conductors on the tops of steeples, which, from the metal spires that are commonly placed there, analogous to the pins and wires, were so liable to accidents. You may laugh at all this, but I assure you I never was more serious in my life. A very amiable lady of my acquaintance, Mrs Douglas of Kelso, had almost lost her life by one of those caps mounted on wire. She was standing at an open window during a thunder-storm; the lightning was attracted by the wire, and the cap was burnt to ashes: happily, her hair was in its natural state, without powder, pomatum, or pins, and prevented the fire from being conducted to her head; for as she felt no kind of shock, it is probable that it went off from the wires of the cap to the wall, close to which she then stood. If it had found any conductor to carry it to her head or body, in all probability she must have been killed. A good strong head of hair, if it is kept perfectly clean and dry, is probably one of the best preservatives against the fire of lightning. But so soon as it is

stuffed full of powder and pomatum, and bound together with pins, its repellent force is lost, and it becomes a conductor.\* But I beg pardon for these surmises; I throw them in your way only for you to improve upon at your leisure, for we have it ever in our power to be making experiments in electricity. And although this fluid is the most subtle and active of any we know, we can command it on all occasions; and I am now so accustomed to its operations, that I seldom comb my hair, or pull off a stocking, without observing them under some form or other. How surprising is it, then, that mankind should have lived and breathed in it for so many thousand years, without almost ever supposing that it existed. But to return to our mountain.

Recupero told me he had observed the same phenomenon here that is common in the eruptions of Mount Vesuvius, namely, red forked lightning darting from the smoke, without being followed by the noise of thunder. The reason possibly is, that the crater and smoke is at that time so highly electrical, that, like a cylinder or globe heated by friction, it throws off spontaneous flashes into the air, without being brought into the attraction of any conductor or body less electric than itself (indeed, the spontaneous discharges from a good electrical globe often bear a perfect resemblance to this kind of lightning); however, if a non-electric cloud were to pass near the crater at that time, the crash of thunder would probably be very violent, which indeed is often the case when the air is full of wet clouds in the time of an eruption; but when this does not happen, the equilibrium is probably restored by degrees, and without any shock, from the surplus of electrical matter being gradually communicated to the earth and sea all around the mountain, the immense lavas that have run from it serving as conductors.

So highly electric is the vapour of volcanoes, that it has been observed in some eruptions both of *Ætna* and *Vesuvius*, that the whole track of smoke, which sometimes extended above a hundred miles, produced the most dreadful effects—killing shepherds and flocks on the mountains, blasting trees, and setting fire to houses, wherever it met with them on an elevated situation. Now, probably the flying of a kite, with a wire round its string, would soon have disarmed this formidable cloud. These effects, however, only happen when the air is dry and little agitated; but when it is full of moist vapour, the great rarefaction from the heat of the lava generally brings it down in violent torrents of rain, which soon convey the electrical matter from the clouds to the earth, and restore the equilibrium.

As *Recupero*, who is a facetious and an agreeable companion, was kind enough to sit a good deal with me during my confinement, I have gathered many remarks from his conversation that may perhaps be worthy of your attention.

\* Since the writing of these letters, the author has made some experiments on the electricity of hair, which tend still to convince him the more of what he has advanced. A lady had told him, that on combing her hair in frosty weather, in the dark, she had sometimes observed sparks of fire to issue from it. This made him think of attempting to collect the electrical fire from hair alone, without the assistance of any other electrical apparatus. To this end he desired a young lady to stand on a cake of bees' wax, and to comb her sister's hair, who was sitting on a chair before her. Soon after she began to comb, the young lady on the wax was greatly astonished to find her whole body electrified, darting out sparks of fire against every object that approached her. The hair was extremely electrical, and affected an electrometer at a very great distance. He charged a metal conductor from it with great ease, and in the space of a few minutes collected as much fire immediately from the hair as to kindle common spirits; and by means of a small phial, gave many smart shocks to all the company. A full account of these experiments was lately read before the Royal Society. They were made during the time of a very hard frost, and on a strong head of hair, where no powder or pomatum had been used for many months.

The variety of waters about *Ætna*, he tells me, is surprising. I have already mentioned the Fiume Freddo, or the river of Acis. Recupero confirms what I had been told of it. There is a lake on the north of the mountain, of about three miles in circumference, which receives several considerable rivers; yet, although there is no apparent outlet, it never overflows its banks. I suggested the probability of a subterraneous communication betwixt this and the Fiume Freddo. He said, there was no resemblance in the quality of their waters; however, I think it is probable that in a course of so many miles through the caverns of *Ætna*, full of salts and minerals, it may acquire both its cold and its vitriolic qualities.

There is another lake on the top of a mountain to the west of *Ætna*, the bottom of which could never be found. It is observed never either to rise or fall, but always to preserve the same level. It is undoubtedly the crater of that mountain (which is all of burnt matter) converted into a lake. The river which supplies the baths of Catania is of a very different nature; it never continues the same, but is perpetually changing. Its current is for the most part confined under ground by the lavas; but sometimes it bursts out with such violence, that the city has suffered greatly from it; and, what is still more unfortunate, these eruptions are generally followed by some epidemical distemper. It has now been constantly diminishing for these two years past, and is at present almost reduced to nothing. They are in perpetual dread of its breaking out, and laying waste their fields, as it has so often done before. What is singular, it generally bursts out after a long tract of the driest and warmest weather. The *Ætnean Academy* have never been able to account for this circumstance. I think it is most probable that it arises from the melting of the snows on *Ætna*, but I shall not pretend to say how. These, perhaps, overflowing the caverns that usually receive their water, the surplus is carried off into this river.

The river of Alcantara certainly takes its rise from the melting of these snows. Its waters, I observed, are of the same whitish colour as all the rivers are that run from the glaciers amongst the Alps. There are several periodical springs on *Ætna*, that flow only during the day and stop during the night. These are naturally and easily accounted for from the melting of the snow; for it melts only during the day, being hard frozen every night, even in the hottest season. There are likewise a variety of poisonous springs, some of so deadly a quality that birds and beasts have been found lying dead on their banks from having drunk of their water. But (what is perhaps still more singular) Recupero told me, that about twenty years ago a rent opened in the mountain, that for a considerable time sent forth so mephitic a vapour, that, like the lake *Avernus*, birds were suffocated in flying over it.

There are many caverns where the air is so extremely cold, that it is impossible to support it for any time. These the peasants make use of as reservoirs for the snow; and, indeed, they make the finest ice-houses in the world, preserving it hard frozen during the hottest summers. It would be endless to give an account of all the caverns and other curious appearances about *Ætna*. Kircher speaks of a cave which he saw, capable, he says, of containing thirty thousand men. Here, he adds, numbers of people have been lost from their temerity in going too far. One of these caverns still retains the name of *Proserpine*, from its being supposed by the ancients the passage by which *Pluto* conveyed her into his dominions; on this occasion *Ovid* describes *Ceres* as searching for her daughter, with two trees which she had plucked from the mountain, and lighted by way of torches. These he calls *teda*, which is still the name of a tree I have seen nowhere but on Mount *Ætna*. It produces a great quantity of rosin, and was surely the most proper tree *Ceres* could have pitched upon

for her purpose. This rosin is called *catalana*, and is esteemed a cure for sores.

I have mentioned the great variety of flowers, trees, &c., on Mount *Ætna*. I have found a long list of them in *Massa*; but as I am not acquainted with their Sicilian names, I can make little out of it. I have engaged a person here to procure me a collection of their seeds in the season. I find of the number, the cinnamon, sarsaparilla, saffra, rhubarb, and many others, that I thought had not been natives of Europe. The *Palma Christi*, too, that plant so much celebrated of late, from the seed of which the castor-oil is made, grows both here and in many other places of Sicily in the greatest abundance. Our botanists have called it *Ricinus Americanus*, supposing it only to be produced in that part of the world. A Bath physician, I remember, has lately written a treatise on this plant, and the virtues of the oil extracted from its seed, which he makes a sort of catholicon. You may believe we shall not leave Sicily without providing ourselves with a quantity of this precious seed.

Mount *Ætna*, I find, is as much celebrated by the ancients as the moderns, for the variety of its odoriferous productions. *Plutarch* says, their smell was so strong, that on many places of the mountain it was impossible to hunt. I shall transcribe the passage as it is before me in an old translation I have borrowed. "*Circum Ætnam in Sicilia neminem ferunt cum canibus venatum iri; quia enim multos perpetuo illic ut in viridario prata, collesque flores mittunt a fragantia, quæ eam oram occupat, obfuscare ferarum anhelationes.*"\* &c. Aristotle has likewise a passage to the very same purpose; but this may suffice.

There were formerly a variety of wild beasts in the woody regions of *Ætna*; but notwithstanding this advantage they had over the dogs and hunters, the number of these is now greatly reduced. They have still, however, the wild boar, the roebuck, and a kind of wild goat; but the race of stags, which was much celebrated, as well as that of bears, is thought to be extinct. Several places of the mountain are still named from those animals.

The horses and cattle of Mount *Ætna* were esteemed the best in Sicily. The cattle are still of a large size, and have horns of such a length that they are preserved as curiosities in some museums. The horses, I am afraid, have degenerated.

There are said to be quantities of porcupines and land tortoises on some parts of *Ætna*; but we had not the good fortune to meet with any of them. Neither did we see any eagles or vultures, which are likewise said to be inhabitants of this mountain.

The accounts given of Mount *Ætna* by the old Sicilian authors (several of whom I have borrowed from Recupero) are very various. Some of them describe the hollow of the crater as being seven or eight miles in circumference, some make it five, and others only three; and probably all of them are right; for I find, by all their accounts, that generally once in about one hundred years, the whole crater has fallen down into the bowels of the mountain; that in process of time, a new crater is seen peeping out of the gulf; which, perpetually increasing by the matter thrown up, is by degrees raised again to its ancient height, till at last, becoming too heavy for its hollow foundations, it again gives way, and at once sinks down into the mountain. This happened about one hundred years ago, in the year 1669, as recorded by *Borelli*, whose account of it I have before me. "*Universum cacumen,† quod ad*

\* [They say that no one can hunt around *Ætna* in Sicily, because the plains and eminences bear flowers perpetually of such garden-like fragrance, and in such profusion, that the whole region is pervaded with an atmosphere in which the scent of wild beasts will not lie, &c.]

† [The whole summit, which was raised, like an observatory or tower, into a huge and lofty mass, was depressed along with the vast surrounding plain of sand, and absorbed in the profound gulf, &c.]

instar speculae, seu turris, ad ingentem altitudinem elevabatur, quod una cum vasta planitie arenosa depressa, atque absorpta est in profundam voraginem," &c. The same likewise happened in the year 1536, as recorded by Fazzello and Filoteo, and in the year 1444, 1329, and 1157. Of all these I have read an account; but probably betwixt the two last mentioned, there has been another that is not recorded, as the intervals betwixt all the rest are pretty nearly equal.

Some of them give a dreadful account of it. Folcando, one of their historians, tells us it shook the whole island, and resounded through all its shores. And their poet Erico says, on the same occasion :

S'ode il suo gran mugito  
Per mille plaghe o lidi.

The bellowing dire a thousand lands resound,  
Whose trembling shores return the dreadful sound.

In all probability, this event will very soon happen, as the circumference of the crater is nowhere recorded to have been reduced to less than three miles; and Recupero says it is at present only three miles and a half; besides, a hundred years, the common period, have now elapsed since its last fall.

There are many stories of people perishing by their temerity, in being too curious spectators of the eruptions of this mountain; but there are still many more of those that have been miraculously saved by the interposition of some saint or the Virgin, who are supposed to be in a perpetual state of warfare with the devils in Mount *Ætna*. That part of the island where *Ætna* stands, has ever been named *Il Val Demoni*, from the frequent apparitions of these devils. It makes one-third of the island. The other two are named the *Val di Noto*, and the *Val di Mazzara*.

There is one story, though a very old one, that is still related at Catania; it is taken notice of by Seneca, Aristotle, Strabo, and others. In the time of a great eruption, when the fire was pouring down upon the city, and every one was carrying off his most valuable effects, two rich brothers, named *Anfinomius* and *Anapias*, neglecting all their wealth, escaped from the conflagration with their aged parents on their backs. These authors add, that the fire, respecting such filial piety, spared them, whilst many others that took the same road were consumed.

This action has been wonderfully extolled, and proves, I think, that feats of this kind were by no means common in those days. Now, pray, don't you think, in the world at present, bad as it is supposed to be, there are few sons who would not have acted in the same manner? and sure I am, the rest of mankind would not have made such a fuss about it. Humanity and natural affection, I believe, in those ages we are inclined to extol so much, were not, by many degrees, so powerful as they are at present. Even the pious *Æneas* himself, one of the most renowned of all their heroes, was in effect but a savage, notwithstanding all that *Virgil* says to persuade us of the contrary; for you find him sacrificing his weak and captive enemies, at the same time that he is canting and preaching up piety and justice.

These two brothers were so celebrated for this action, that there was a dispute betwixt *Syracuse* and *Catania* which of these cities had given them birth; and temples were erected in both of them, dedicated to *Filial Piety*, in memory of the event.

In the accounts of the more recent destructions of *Catania*, there occurs no instance of this sort. We find them only lamenting the loss of priests and nuns, and very much out of humour at their saints for allowing the devils to get the better of them. I have been a good deal entertained with some of those authors. *Selvaggio*, one of their poets, speaking of the terrible earthquake in the year 1169, that destroyed *Catania*, and buried multitudes of people in the ruins, describes it in the following manner, which may serve as a specimen of the poetry of that time.

Cataneam doleo, dolor est miserabile dictu:

Clara potens antiqua fuit; plebe, milite, clero,

Divitiis, auro, specie, virtute, triumphis.

Heu terræ motu ruit illa potentia rerum!

Morte ruit juvenis, moritur vir, sponsa maritus.

Unde superbit homo? Deus una diruit hora

Turres, ornatus, vestes, cunctosque paratus.

In tanto gemitu perit pars maxima gentis,

Proh dolor! et monachi quadraginta quatuor et plus.

Et perit pastor patriæ, pater ipse Johannes

Pontificalis honor, lux regni sic perire.

[I weep Catania! sad the tale to tell.

Famed, potent, ancient was she—in her priests,

Her people, valour, triumphs, commerce, wealth.

Alas! the earthquake all this bravery whelm'd!

By death the boy, the man, wife, husband fell.

Whence human pride? Fate in an hour destroys

Towers, garnishings, and garbs—all man's array.

So sadly fell Catania's chiefest sons,

And four and forty men of God and more!

The pastor of the land there died; and father John,

The priesthood's light and honour, perished there.]

But another, *Gustanavilla*, one of their historians, gives a very different account of this affair: as it is likewise somewhat curious in its way, I shall copy it for your amusement: "In omnem terram, et in fines orbis terræ jam exiit plaga illa, qua nuper in Sicilia percussus sunt Catanenses in vigilia B. Agathæ; cum episcopus ille damnatissimus, qui, sicut scitis, sibi sumpsit honorem, non vocatus a Domino, tanquam *Aaron*, et qui ad sedem illam, non electione canonica, sed *Gieziâ* venalitate intravit; cum, inquam, abominatiois offerret incensum, intonuit de cælo Dominus, et ecce terræ motus factus est magnus; angelus enim Domini percuteus episcopum in furore Domini cum populo, et universa civitate subvertit."\* He adds, that if *St Agatha's* veil had not been produced, the angel of the Lord was in such a fury, that he would not have left one soul alive.

There is a curious painting of the great eruption in 1669, in the cathedral of this place. It is but indifferently painted, but gives a dreadful idea of that event. *Borelli*, who was upon the spot, describes it. He says, on the 11th of March, some time before the lava burst out, after violent earthquakes and dreadful subterraneous bellowing, a rent was opened in the mountain twelve miles long; in some places of which, when they threw down stones, they could not hear them strike the bottom. He says, that burning rocks, sixty palms in length, were thrown to the distance of a mile; and that the giants, supposed to be buried under Mount *Ætna*, seemed to have renewed their war against heaven: that stones of a lesser size were carried upwards of three miles; and that the thunder and lightning from the smoke was scarce less terrible than the noise of the mountain. He adds, that after the most violent struggles and shaking of the whole island, when the lava at last burst through, it sprung up into the air to the height of sixty palms. In short, he describes that event, as well as the universal terror and consternation it occasioned, in terms full of horror. For many weeks the sun did not appear, and the day seemed to be changed into night. Soon after the lava got vent, which was not till four months from the time that the mountain began to labour, all these dreadful symptoms abated, and it was soon after perfectly quiet.

He says this deluge of fire, after destroying the finest country in *Sicily*, and sweeping away churches,

\* [Already over the whole earth, even to its farthest boundaries, have passed the tidings of that blow which fell upon the *Catanians*, in *Sicily*, on the eve of *St Agatha*: when that most accused prelate, who, as you know, was not called by the Lord like *Aaron*, but assumed of himself his honours, and stepped into his high office, not by canonical election, but by Jesuitical venality—when he, I say, offered up the incense of his abominations, the Lord thundered from heaven, and behold! a great earthquake took place; for an angel, striking the bishop in the wrath of the Lord, overthrew him with the people, and the whole city.]

villages, and convents, broke over the lofty walls of Catania, and covered up five of its bastions, with the intervening curtains. From thence, pouring down on the city, it destroyed every object it met with, overwhelming and burying all in one promiscuous ruin.

What he regrets most, was some precious remains of antiquity, the names, the situation, and even the memory of whose existence, is now lost in the place. He mentions an amphitheatre, which he calls *Colliseo*, the *Circus Maximus*, the *Naumachia*, and several temples.

An account of this great eruption was sent to Charles II. by Lord Winchelsea, who was then returning from his embassy at Constantinople, and stopped here on purpose to see so remarkable an event. But his lordship has not been at that pains to examine it we could have wished. His curiosity was satisfied in one day; and he seems to have been contented only to look at the lava at a great distance, but did not think of examining its source, or ascending the mountain, although at that time all the most formidable circumstances of the eruption were already over.

I should not finish this account of Mount *Ætna*, without saying something of the various fables and allegories to which it has given rise; but it would probably lead me into too vast a field, and give this more the air of a dissertation than a letter or a journal. These you will easily recollect. They have afforded ample employment for the muse, in all ages and in all languages; and, indeed, the philosopher and natural historian have found, in the real properties of this mountain, as ample a fund of speculation, as the poets have done in the fictitious. It is so often mentioned by the ancient writers, that it has been said of *Ætna* as well as of Greece—

*Nullum est sine nomine saxum.*

[There is no single stone without its name.]

However, I am afraid this saying was much more applicable to it formerly than it is at present; for we even found several large mountains that had no name, and it does not at all appear that the number of philosophers in Sicily have by any means increased in the latter ages. Their ambition is now changed; and if they can get a saint to keep the devils of *Ætna* in order, they trouble themselves very little about the cause of its operations, and do not value their island half so much for having given birth to *Archimedes* or *Empedocles*, as to *St Agatha* and *St Rosalia*.

The ancients, as well as the moderns, seem ever to have considered *Ætna* as one of the highest mountains on the globe. There are many passages in their authors that show this, though perhaps none more strongly than their making *Deucalion* and *Pyrrha* take refuge on the top of it, to save themselves from the universal deluge.\*

I shall now conclude this long account of Mount *Ætna* with Virgil's celebrated description of it in the third *Æneid*, which has been so much admired. You may compare it with the following description of the famous poet *Raitano*, held, I assure you, in full as high estimation by the Sicilians.

*Nel mezzo verso l'ethere avvicina  
Ætna la fronte sua cinta di orrori,  
E con ispavantevole rovina  
Rimbomba, e con orribili fragori.  
Sovente negri nubi al ciel destina  
Fumanti di atro turbine, e di ardori,  
Ergi globbi di fiamma, e su lambisce  
Le stelle omai con infocate striscie;*

\* *Cataclysmus quod nos Diluvium dicimus cum factus est, omne genus humanum interit præter Deucalionem et Pyrrham, qui in monte Ætnam qui altissimus in Sicilia esse dicitur fugerunt, &c.—HIGIUS.*

[When the catastrophe which we call the Deluge took place, the whole human race perished, with the exception of *Deucalion* and *Pyrrha*, who took refuge upon Mount *Ætna*, said to be the highest in Sicily, &c.]

*Scogli, e divelte viscere di monti  
Eruttando tal volta avido ostello;  
E con gemiti volta, e con onte  
Liquifatti macigni, e in fondo bolle.*

So sings the Sicilian muse; you will not, however, hesitate to give the preference to the Roman one, although the former is evidently stolen from her.

————— *Horrificis juxta tonat Ætna ruinis,  
Interdumque atram prorumpit ad æthera nubem,  
Turbine fumantem piceo et candente favilla,  
Attollitque globos flammaram, et sidera lambit.  
Interdumque scopulis, avolsaque viscera montis  
Erigit eructans, liquefactaque saxa sub auras  
Cum gemitu glomerat, fumoque exæstat imo.*

[The port capacious, and secure from wind,  
Is to the foot of thundering *Ætna* join'd;  
By turns a pitchy cloud she rolls on high;  
By turns hot embers from her entrails fly,  
And flakes of mounting flames, that lick the sky.  
Oft from her bowels massy rocks are thrown,  
And, shiver'd by the force, come piecemeal down;  
Oft liquid lakes of burning sulphur flow,  
Fed from the fiery springs that boil below.]

But both these have been greatly outdone by the wonderful imagination of our great countryman, Sir *Richard Blackmore*, who accounts at once for the whole phenomena of *Ætna*, by the simple idea of giving the mountain a fit of the colic—a thought that had escaped all the poets and philosophers of antiquity, and seems for ever to have been reserved for the profound genius of this great master and father of the bathos. I have forgot the passage, but you will find it, I think, in *Prince Arthur*.

The philosophical poet, *Lucretius*, has likewise mentioned the eruptions of Mount *Ætna*; but *Pindar* is the oldest poet we know of that has taken any notice of them. His description is, I think, the most satisfactory of all, and conveys a clearer idea both of the mountain itself, and an eruption of the mountain, than either the Roman or Sicilian poet, though it is not near so much laboured, nor worked up with all that variety of circumstances they have found means to introduce. Its greatest fault is, that *Pindar* had still kept in view that absurd idea of the ancients, that *Jupiter* had buried the giants under Mount *Ætna*, and that their struggling to get loose was the cause of its eruptions; but even this he touches but slightly, as if ashamed to give such a reason. The passage is translated into English by Mr *West*.

*Now under smoking Cuma's sulphurous coast  
And vast Sicilia, lies his tortured breast,  
By snowy Ætna, nurse of endless frost,  
The mighty prop of heaven, for ever prest;  
Forth from whose flaming caverns issuing rise  
Tremendous fountains of pure liquid fire,  
Which veil in ruddy mists the noonday skies,  
While wrapt in smoke the eddy flames aspire;  
Or gleaming through the night with hideous roar,  
Far o'er the redd'ning main huge rocky fragments pour.*

This passage decides what has been much disputed, that *Ætna* was, in these early ages, of as great an elevation as at present. It has been alleged, that volcanoes always increase in height till they are extinguished, when they are supposed to moulder down, and by degrees sink into the caverns that are below them, like the *astruni*, and the *solfaterra* at *Naples*: however, we find that *Ætna* was at that time as now, covered with eternal snows, and was supposed, like *Atlas*, to be one of the great props of heaven. But what pleases me the most in this description is, that it proves beyond the possibility of a doubt, that in these very remote eruptions, it was common for the lavas of *Ætna* to run a great way out to sea. The conclusion, I think, is fully as just, and perhaps not less sublime, than the "*avolsaque viscera montis erigit eructans*" of *Virgil*, which, I must own, I think rather comes too near Sir *Richard's* fit of the colic.

*Thucydides* speaks of three eruptions of this moun-

tain, but is not so particular as we could have wished. He does not mention the date of the first, but says it was the earliest after the arrival of the Greeks in Sicily. The second happened about the time of the 77th Olympiad, and the last in that of the 88th, which was nearly about the period when Pindar wrote; so that we cannot doubt that his description is taken from the accounts he had heard of some of those eruptions, the circumstances of which, no doubt, at that time, had afforded matter of conversation all over Greece.

I think we may now try to take leave of *Ætna*, though I am afraid, during the remainder of our expedition, we shall meet with nothing worthy to succeed it. We shall sail from hence to-morrow morning, and expect to sleep at Syracuse, as it is only about fifty miles distant. I shall write to you again from the ruins of that celebrated city. Farewell. Ever yours.

~~~~~

VOYAGE TO SYRACUSE.—RUINS OF THE CITY.

*Syracuse, June 1st.*

On the 31st of May, we embarked on board a felucca, and set sail for the mighty Syracuse. The wind was favourable, and for some time we went at a great rate. The view of Mount *Ætna*, for the whole of this little voyage, is wonderfully fine, and the bold black coast, formed for near thirty miles of the lava of that immense volcano, gives the most awful idea of its eruptions. There is no part of this coast nearer than thirty miles to its summit; and yet there has hardly been any great eruption where the lava has not reached the sea, and driven back its waters to a great distance, leaving high rocks and promontories, that for ever set its waves at defiance, and prescribe their utmost limits. What a tremendous scene must the meeting betwixt these adverse elements have formed?

We may easily conceive the variety of changes this coast has undergone in the space of some thousands of years, as every great eruption must have made a considerable difference. Virgil is wonderfully minute and exact in his geography of Sicily; and this is the only part of the island that seems to be materially altered since his time. He says there was a large port at the foot of *Ætna*, where ships are secure from every wind:

*Portus ab accessu ventorum immotus et ingens;*  
[The port capacious and secure from wind.]

of which, at present, there are not the least remains. It is probably the same that was called by the Sicilians the port of Ulysses, which is often mentioned by their writers. The place of its existence is still shown betwixt three and four miles up the country, amongst the lavas of *Ætna*. However, I can see no sort of reason why they have called this the port of Ulysses; for surely Homer does not bring his hero near the precincts of Mount *Ætna*. Indeed, I think it is evident, that this volcano did not burn during the time of Homer, nor for some ages preceding it, otherwise it is not possible that he would have said so much of Sicily, without taking any notice of so great and capital an object, which, of all others, the daring and sublime imagination of Homer would have been the most eager to grasp at. It is evident from his account, that Ulysses landed at the west end of Sicily, opposite to the island of Lachæa, now Favignana, almost two hundred miles distant from this port.

Virgil, with more judgment, lands his hero at the foot of *Ætna*, which gives him an opportunity of introducing some of the finest descriptions in the *Æneid*. But it is somewhat odd, that here he makes *Æneas* find one of Ulysses's companions, who had escaped the rage of Polyphemus, and had lived for several months in the woods and caverns of this mountain. Virgil must have been aware of this impropriety, as he well

knew that Homer had landed Ulysses, and placed the cave of Polyphemus at the most distant point of the island. But he could not prevail on himself to pass Mount *Ætna*. He was so thoroughly convinced that this was the most proper landing-place for an epic hero, as well as the most proper habitation for the Cyclops, that, by a bold poetical license, he has fairly taken it for granted that Homer really made it so. Indeed, in this passage, the pleasure he affords to the imagination of his reader makes an ample amends for his having imposed on his judgment. But to return to our voyage.

The view of the mountain from the sea is more complete and satisfactory than any where on the island. The eye takes in a greater portion of the circle, and you observe, with more distinctness, how it rises equally on all sides, from its immense base, overspread with the beautiful little mountains I have mentioned, and at once can trace the progress of vegetation, from its utmost luxuriance to where it is checked by the two extremes of heat and of cold. The different regions of the mountain are distinctly marked out by their different colours and different productions, exposing at once to the ravished eye every climate and every season, with all their variety—

Where blossoms, fruits, and flowers, together rise,  
And the whole year in gay confusion lies.

The first region exhibits every object that characterises summer and autumn; the second, those of the most delightful spring; the third, an eternal and unrelenting winter; and the fourth, to complete the contrast, the regions of unextinguishable fire.

The circumference of the great base of *Ætna*, *Recupero* told me, he had been at a good deal of pains to ascertain, as it had generally been computed at only a hundred miles, or little more, although the radii of that circle had ever been esteemed at thirty of those miles, an absurdity in computation that had put him upon making this inquiry. The result was, that taking the supposed distances of one place from another, all the way round, the sum of the whole amounted to 183 miles, an immense circle surely, and which is still enlarged by every considerable eruption. The whole of this circle is formed of lava and burnt matter; and I have observed, that near the very outermost borders of it, there have been many little eruptions that have pierced through some of the thickest lavas of *Ætna*. The small eruptions, at so vast a distance from the great furnace of the mountain, are probably occasioned by the intense heat of the lava, which continues for many years, rarifying the air in the caverns it has run over, which, bursting forth from its prison, the lava sinks down, and kindling the sulphur and nitre with which these caverns are filled, exhibits in miniature the phenomena of a great eruption.

There is a large sandy beach that extends from the mouth of the river *Simetus*, a great way to the south of Catania, and was probably continued the whole way to the foot of the mountain of *Taurominum* (where there are still some remains of the east end of it), till it was broken in upon many thousand years ago by the lavas of *Ætna*, which, from a flat sandy shore, have now converted it into a high, bold, black iron coast. What is a strong proof of this—in many places where they have sunk deep wells, after piercing through the lava, they have at last come to beds of shells and sea sand.

There is nothing else very interesting in the voyage from Catania to Syracuse. If you will read the conclusion of the third book of the *Æneid*, you will find a much better description of it than any I can give you. The coast lies low, and, except *Ætna*, there are no very striking objects.

We passed the mouths of several rivers: the first and most considerable is the *Giaretta*, or river of St Paul, formerly the *Simetus*, and under that name celebrated by the poets. The nymph *Thalia*, after

her amour with Jupiter, is supposed to have been changed into this stream; and, to avoid the resentment of Juno, sunk under ground near Mount *Ætna*, and continued her subterraneous course to the sea. This river was navigable in the time of the Romans, and *Massa* says, the only one in the island that was so. It takes its rise on the north side of *Ætna*, and surrounding the west skirts of the mountain, falls into the sea near the ruins of the ancient *Morgantio*. It no longer sinks under ground as it did formerly; but it is now celebrated for a quality it does not appear to have possessed in the times of antiquity, as none of the old writers take notice of it. It throws up near its mouth great quantities of fine amber; this is carefully gathered by the peasants in the neighbourhood, and brought to *Catania*, where it is manufactured into the form of crosses, beads, saints, &c., and is sold at high prices to the superstitious people on the continent. We bought several of these respectable figures, and found them electrical in a high degree; powerfully attracting feathers, straws, and other light bodies; somewhat emblematical, you will say, of what they represent. Some pieces of this amber contain flies and other insects curiously preserved in its substance; and we were not a little entertained with the ingenuity of one of the artists, who has left a large blue-bottle fly, with its wings expanded, exactly over the head of a saint, to represent, he told us, *lo Spirito Santo* descending upon him. I have got some fine pieces of this amber, more electric, I think, and emitting a stronger smell, than that which comes from the Baltic. The generation of this substance has long been a controverted point among naturalists, nor do I believe it is as yet ascertained whether it is a sea or a land production. It is generally supposed to be a kind of gum or bitumen, that issues from the earth in a liquid state, at which time the flies and other insects that light upon it are caught, and by their struggles to get loose, soon work themselves into its substance, which hardening round them, they are for ever preserved in the greatest perfection. Large fine pieces are constantly found at the mouth of the *Sinetus*, supposed to have been brought down by the river; but it is singular that none of it is ever found any where but on the sea-shore: they have likewise here a kind of artificial amber, made, I am told, from copal, but it is very different from the natural.

Not far from the mouth of this river there are two of the largest lakes in Sicily—the *Beviere* and the *Pantana*, the first of which is supposed to have been made by *Hercules*, in consequence of which it was held sacred by the ancients. They are full of a variety of fish, one species of which, called *moletti*, is much esteemed: the salting and exportation of these makes a considerable branch of their commerce at *Leontini*, which is in that neighbourhood: that city is one of the most ancient in the island, and is supposed to have been the habitation of the *Lestrigons*.

The *Leontine* fields have been much famed for their fertility. Both *Diodorus* and *Pliny* assert that they yielded wheat a hundred-fold, and that grain grew spontaneously here without culture; but this was only during the reign of *Ceres*, and is not now the case.

In a few hours' sailing we came in sight of the city of *Augusta*, which is beautifully situated in a small island that was formerly a peninsula; it was therefore called by the *Greeks* *Chersonesus*. Both the city and the fortifications seem considerable, and are said to contain about nine thousand inhabitants. The ruins of the *Little Hybla*, so celebrated for its honey, lie within a few miles of this place.

Some time before our arrival at *Syracuse* it fell a dead calm, and we spied a fine turtle fast asleep on the surface of the water. Our pilot ordered a profound silence, and only two oars to row very gently, that if possible we might surprise him. Every thing was put in order, and two men were placed ready at the prow to secure the prize. We were all attention and

expectation, and durst hardly breathe for fear of disturbing him.

We moved slowly on, and the turtle lay stone still: the two men bent down their bodies, and had their arms already in the water to seize him. No alderman, with all deference be it spoken, ever beheld his turtle upon the table with more pleasure and security, nor feasted his imagination more lasciviously upon the banquet. He was already our own in idea, and we were only thinking of the various ways in which he should be dressed; when—how vain and transitory all human possessions!—the turtle made a plunge, slipped through their fingers, and disappeared in a moment, and with him all our hopes. We looked very foolish at each other, without uttering a word, till *Fullarton* asked me, in the most provoking manner in the world, whether I would choose a little of the callipash or the callipee. The two men shrugged up their shoulders, and said *pazienza*; but *Glover* told them in a rage, that all the *pazienza* on earth was not equal to a good turtle.

Soon after this the remains of the great *Syracuse*\* appeared—the remembrance of whose glory, magnificence, and illustrious deeds, both in arts and arms, made us for some time even forget our turtle. But, alas! how are the mighty fallen! This proud city, that vied with *Rome* itself, is now reduced to a heap of rubbish, for what remains of it deserves not the name of a city. We rowed round the greater part of the walls without seeing a human creature—those very walls that were the terror of the *Roman* arms, from whence *Archimedes* battered their fleets, and with his engines lifted their vessels out of the sea and dashed them against the rocks. We found the interior part of the city agreed but too well with its external appearance. There was not an inn to be found, and after visiting all the monasteries and religious fraternities in search of beds, we found the whole of them so wretchedly mean and dirty that we preferred at last to sleep on straw; but even that we could not have clean, but were eaten up with vermin of every kind.

We had letters for the *Count Gaetano*, who made an apology that he could not lodge us, but in other respects showed us many civilities, particularly in giving us the use of his carriage, in explaining the ruins, in pointing out every thing that was worthy of our attention; and likewise in giving us letters of recommendation for *Malta*. He is a gentleman of good sense, and has written several treatises on the antiquities of Sicily.

Of the four cities that composed the ancient *Syracuse*, there remains only *Ortigia*, by much the smallest, situated in the island of that name. It is about two miles round, and supposed to contain about fourteen thousand inhabitants. The ruins of the other three, *Tycha*, *Achradina*, and *Neapoli*, are computed at twenty-two miles in circumference, but almost the whole of this space is now converted into rich vineyards, orchards, and corn-fields; the walls of these are indeed every where built with broken marbles full of engravings and inscriptions, but most of them defaced and spoiled. The principal remains of antiquity are a theatre and amphitheatre, many sepulchres, the La-

\* [Now called *Siragosa*, with a population of 13,900; anciently the chief city of Sicily, and one of the most magnificent in the world, with 300,000 inhabitants. It was the principal of the colonies which the *Greeks* planted in Sicily, being founded by the *Corinthians*, 736 years before Christ. The modern city still has an excellent harbour, capable of receiving vessels of the greatest burden, and of containing a numerous fleet. The ancient city was of a triangular form, twenty-two miles in circuit, and consisted of four parts, each surrounded by distinct walls. During the three years between 212 and 215 B.C., *Syracuse* was besieged by the *Romans*. It was at this time that *Archimedes*, its celebrated geometrician, used so many extraordinary expedients in its defence. Its subsequent history, for many centuries, was that of a part of the *Roman* empire.]

tomie, the Catacombs, and the famous ear of Dionysius, which it was impossible to destroy. The Latomie now makes a noble subterraneous garden, and is indeed one of the most beautiful and romantic spots I ever beheld. Most of it is about one hundred feet below the level of the earth, and of an incredible extent. The whole is hewn out of a rock as hard as marble, composed of a concretion of shells, gravel, and other marine bodies. The bottom of this immense quarry, from whence probably the greater part of Syracuse was built, is now covered with an exceeding rich soil, and as no wind from any point of the compass can touch it, it is filled with a great variety of the finest shrubs and fruit-trees, which bear with vast luxuriance, and are never blasted. The oranges, citrons, bergamots, pomegranates, figs, &c., are all of a remarkable size and fine quality. Some of these trees, but more particularly the olives, grow out of the hard rock, where there is no visible soil, and exhibit a very uncommon and pleasing appearance.

There is a variety of wild and romantic scenes in this curious garden, in the midst of which we were surprised by the appearance of a figure under one of the caverns, that added greatly to the dignity and solemnity of the place. It was that of an aged man, with a long flowing white beard that reached down to his middle. His old wrinkled face and scanty grey locks pronounced him a member of some former age as well as of this. His hands, which were shook by the palsy, held a sort of pilgrim's staff, and about his neck there was a string of large beads with a crucifix hanging to its end. Had it not been for these marks of his later existence, I don't know but I should have asked him whether, in his youth, he had not been acquainted with Theocritus and Archimedes, and if he did not remember the reign of Dionysius the tyrant. But he saved us the trouble, by telling us he was the hermit of the place, and belonged to a convent of Capuchins on the rock above; that he had now bid adieu to the upper world, and was determined to spend the rest of his life in this solitude, in prayer for the wretched mortals that inhabit it.

This figure, together with the scene in which it appears, are indeed admirably well adapted, and reflect a mutual dignity upon each other. We left some money upon the rock; for the Capuchins, who are the greatest beggars on earth, never touch money, but save their too tender consciences, and preserve their vows unbroken, by the simple device of lifting it with a pair of pincers, and carrying it to market in their sack or cowl. This I have seen more than once. We were much delighted with the Latomie, and left it with regret: it is the very same that has been so much celebrated by Cicero about eighteen hundred years ago: "Opus est ingens," says he, "magnificum, regum ac tyrannorum. Totum ex saxo in mirandam altitudinem depressum," &c.\* A little to the west of it is supposed to have stood the country-house, the sale of which you will remember he gives so lively and pleasant an account of, by which a goldsmith (I have forgot his name) cheated a Roman nobleman in a very ingenious manner.

The ear of Dionysius is no less a monument of the ingenuity and magnificence than of the cruelty of that tyrant. It is a huge cavern cut out of the hard rock, in the form of the human ear. The perpendicular height of it is about eighty feet, and the length of this enormous ear is not less than two hundred and fifty.† The cavern was said to be so contrived that every sound made in it was collected and united into one point, as into a focus; this was called the tympanum; and exactly opposite to it the tyrant has made a small hole, which communicated with a little apartment where he used to conceal himself. He applied his own ear to this

hole, and is said to have heard distinctly every word that was spoken in the cavern below. This apartment was no sooner finished, and a proof of it made, than he put to death all the workmen that had been employed in it. He then confined all that he suspected were his enemies; and, by overhearing their conversation, judged of their guilt, and condemned or acquitted accordingly.

As this chamber of Dionysius is very high in the rock, and now totally inaccessible, we had it not in our power to make proof of this curious experiment, which our guides told us had been done some years ago by the captain of an English ship.

The echo in the ear is prodigious, much superior to any other cavern I have seen. The holes in the rock, to which the prisoners were chained, still remain, and even the lead and iron in several of them. We surprised a poor young porcupine who had come here to drink, of whom our guides made lawful prize. Near to this there are caverns of a great extent, where they carry on a manufactory of nitre, which is found in vast abundance on the sides of these caves.

The amphitheatre is in the form of a very eccentric ellipse, and is much ruined; but the theatre is so entire that most of the gradini or seats still remain. Both these are in that part of the city that was called Neapoli, or the New City. "Quarta autem est urbs," says Cicero, "quæ quia postrema ædificata est, Neapolis nominatur, quam ad summam theatrum est maximum," &c.\* However, it is but a small theatre in comparison of that of Taurominum. We searched amongst the sepulchres, several of which are very elegant, for that of Archimedes, but could see nothing resembling it. At his own desire it was adorned with the figure of a sphere inscribed in a cylinder, but had been lost by his ungrateful countrymen, even before the time that Cicero was quæstor of Sicily. It is pleasant to observe with what eagerness this great man undertakes the search of it, and with what exultation he describes his triumph on the discovery. "Ego autem cum omnia collustrarem oculis (est enim ad portas Agragianas magna frequentia sepulchrorum) animadverti columnellam non multum e dumis eminentem, in qua inerat spheræ figura et cylindri. Atque ego statim Syracusanis (erant autem principes mecum) dixi, me illud ipsum arbitrari esse quod quærerem. Immissi cum falcebus multi purgarunt, et aperuerunt locum: quo cum patefactus esset aditus ad adversam basim accessimus; apparebat epigramma exesis posterioribus partibus versiculorum dimidiatis fere: ita nobilissima Græciæ civitas, quondam vero etiam doctissima sui civis unius acutissimi monumentum ignorasset, nisi ab homine Arpinate didicisset,"† &c.

The catacombs are a great work, little inferior either to those of Rome or Naples, and in the same style. There are many remains of temples. The Duke of Montalbano, who has written on the antiquities of Syracuse, reckons near twenty; but there is hardly any of these that are now distinguishable. A few fine columns of that of Jupiter Olympus still remain; and the temple of Minerva (now converted into the cathedral of the city, and dedicated to the Virgin) is almost entire. They have lately built a

\* [But there is a fourth (part of) the city, which, from its being last built, has been called Neapoli, and on the ascent of which stands a very large theatre, &c.]

† [But while I was closely examining the whole space (for there is an abundance of sepulchres at the Agragantine gates), I observed a small column, rising but slightly above the brambles, on which were graven the figures of a sphere and a cylinder. Turning to the Syracusan nobles who were with me, I at once exclaimed, that there was, in my own opinion, the very object of our search. A number of persons were immediately employed to clear away the weeds from the spot, and as soon as a passage was opened up, we drew near, and found on the opposite base the inscription, with nearly the latter half of the verses eaten away. Thus would the noblest, and formerly the most learned of Greek cities, have remained in ignorance respecting the tomb of its most ingenious citizen, had it not been pointed out by a native of Arpinum, &c.]

\* [It is a huge and magnificent work of kings, the whole being cut out of a hollow rock, to a great height, &c.]

† [It has been more accurately described as 170 feet long, 60 high, and from 20 to 35 wide.]

new façade to it; but I am afraid they have not improved on the simplicity of the antique. It is full of broken pediments, and I think in a bad style.

Ortigia, the only remaining part of Syracuse, was anciently an island; it is often denominated such by Virgil, Cicero, and many of the Greek and Latin historians. In latter ages, and probably by the ruins of this mighty city, the strait that separated it from the continent was filled up, and it had now been a peninsula for many ages, till the present King of Spain, at a vast expense, cut through the neck of land that joined it to Sicily, and has again reduced it to its primitive state.

Here he has raised a noble fortification, which appears to be almost impregnable. There are four strong gates, one within the other, with each a glacis, covered way, scarp and counter-scarp, and a broad deep ditch filled with sea-water, and defended by an immense number of embrasures, but not so much as one single piece of artillery. This you will no doubt think ridiculous enough; but the ridicule is still heightened when I assure you there is not a cannon of any kind belonging to this noble fortress, but one small battery of six-pounders for saluting ships that go in and out of the port. If you are at a loss to account for this, you will please remember that it is a work of the King of Spain. However, the ditches are very useful; they are perpetually covered with fishing-boats; and they can use their nets and lines here with the greatest success, even in the most stormy weather, though I dare say this was none of the motives that induced his majesty to make them. The nobility of the place have likewise barges here for their amusement.

As the celebrated fountain of Arethusa has ever been looked upon as one of the greatest curiosities of Syracuse, you may believe we were not a little impatient to examine it; and, indeed, only by observing Cicero's account of it,\* we soon found it out. It still exactly answers the description he gives, except with regard to the great quantities of fish it contained, which seem now to have abandoned it.

The fountain of Arethusa was dedicated to Diana, who had a magnificent temple near it, where great festivals were annually celebrated in honour of the goddess. We found a number of nymphs up to the knees in the fountain, busy washing their garments, and we dreaded the fate of Actæon and Alpheus; but if these were of Diana's train, they are by no means so coy as they were of old, and a man would hardly choose to run the risk of being changed either into a stag or a river for the best of them.

It is indeed an astonishing fountain, and rises at once out of the earth to the size of a river. The poetical fictions concerning it are too well known to require that I should enumerate them. Many of the people here believe to this day that it is the identical river Arethusa that sinks under ground near Olympia in Greece, and continuing its course for five or six hundred miles below the ocean, rises again in this spot.

It is truly astonishing that such a story as this should have gained such credit among the ancients, for it is not only their poets, but natural historians and philosophers too, that take notice of it. Pliny mentions it more than once; and there are few or none of the Latin poets that it has escaped.

This strange belief has been communicated to the Sicilian authors, and, what is amazing, there is hardly

\* In hac insula extrema est fons aque dulcis, cui nomen Arethusa est, incredibili magnitudine plenissimus piscium, qui fluctu totus operiretur, nisi munitione, ac mole lapidum a mari disjunctus esset, &c.

[There is in this island a fountain of sweet water, named Arethusa, and filled with an incredible number of fishes, which would be concealed from view in its whole course but for the check of an embankment and pile of stones disjoining it from the sea, &c.]

any of them that doubts of it; Pomponius Mela, Pausanias, Massa, and Fazzello, are all of the same sentiments, to support which they tell you the old story of the golden cup won at the Olympic games, which was thrown into the Grecian Arethusa, and was soon after cast up again by the Sicilian one.

They likewise add, that it had always been observed, that after the great sacrifices at Olympia, the blood of which fell into that river, the waters of Arethusa rose for several days tinged with blood. This, like many modern miracles, was probably a trick of the priests. Those of Diana had the charge of the fountain of Arethusa, and no doubt were much interested to support the credit of the story; for it was that goddess that converted the nymph Arethusa into a river, and conducted her by subterraneous passages from Greece to Sicily, to avoid the pursuit of Alpheus, who underwent the same fate.

At a little distance from the fountain of Arethusa there is a very large spring of fresh water that boils up in the sea. It is called Occhi di Zilica, and by some Alpheus, who is supposed by the poets to have pursued Arethusa below the sea all the way to Sicily.\*

As this spring is not taken notice of by any of the great number of the ancients that speak of Arethusa, it is most probable that it did not then exist, and is a part of that fountain that has since burst out before its arrival at the island of Ortigia. Had it been visible in the time of the Greeks, there is no doubt that they would have made use of this as a strong argument to prove the submarine journey of Arethusa, as it in fact rises at some distance in the sea, and pretty much in the same direction that Greece lies from Ortigia. It sometimes boils up so strongly, that after piercing the salt water, I am told it can be taken up very little affected by it.

Syracuse has two harbours, the largest of which, on the south-west side of Ortigia, is reckoned six miles round, and was esteemed one of the best in the Mediterranean. It is said by Diodorus to have run almost into the heart of the city, and was called Marmoreo, because entirely surrounded with buildings of marble; the entry into this harbour was strongly fortified, and the Roman fleets could never penetrate into it.

The small port is on the north-east of Ortigia, and is likewise recorded to have been highly ornamented. Fazzello says there is still the remains of a submarine aqueduct that runs through the middle of it, which was intended to convey the water from the fountain of Arethusa to the other parts of the city.

Near this port they show the spot where Archimedes's house stood, and likewise the tower from whence he is said to have set fire to the Roman galleys with his burning-glasses—a story which is related by several authors, but which is now almost universally exploded, from the difficulty to conceive a burning-glass, or a concave speculum, with a focus of such an immense length as this must have required.

However, I should be apt to imagine, if this be not entirely a fiction (of which there is some probability), that it was neither performed by refracting burning-glasses nor speculums, but only by means of common looking-glasses, or very clear plates of metal. Indeed, from the situation of the place, it must have been done by reflection; for Archimedes's tower stood on the north of the little port where the Roman fleet are said to have been moored, so that their vessels lay in a right line betwixt him and the sun at noon, and at a very small distance from the wall of the city where this tower stood. But if you will suppose this to have

\* [According to a German traveller of 1822, "the Arethusa has lost the translucent purity of her virgin waters, which have become turbid and muddy; and, being further defiled by her condemnation to serve the base office of cleansing all the foul linen in Syracuse, she is any thing but a fair bride when she falls into the arms of Alpheus, who still fondly awaits her upon the margin of the sea-shore."—*Foreign Quarterly Review*, No. 23.]

been performed by common burning-glasses, or by those of the parabolical kind, it will be necessary to raise a tower of a most enormous height on the island of Ortigia, in order to interpose these glasses betwixt the sun and the Roman galleys; and even this could not have been done till late in the afternoon, when his rays are exceedingly weak. But I have very little doubt that common looking-glasses would be found all-sufficient to perform these effects.

Let us suppose that a thousand of these were made to reflect the rays to the same point; the heat, in all probability, must be increased to a greater degree than in the focus of most burning-glasses, and abundantly capable of setting fire to every combustible substance. This experiment might be easily made by means of a battalion of men, arming each with a looking-glass instead of a firelock, and setting up a board at two or three hundred yards distance for them to fire at. I suppose it would take a considerable time before they were expert at this exercise; but by practice, I have no doubt that they might all be brought to hit the mark instantaneously at the word of command, like the lark-catchers in some countries, who are so dexterous at this manœuvre, that with a small mirror they throw the rays of light on the lark, let her be never so high in the air, which, by a kind of fascination, brings down the poor animal to the snare.

You may laugh at all this; but I don't think it is impossible that a looking-glass may one day be thought as necessary an implement for a soldier as at present it is for a beau. I am very apprehensive the French will get the start of us in this signal invention, as I have been assured long ago, that few of their men ever go to the field without first providing themselves with one of these little warlike engines, the true use of which, happily for us, they are as yet unacquainted with. You will easily perceive, that if this experiment succeeds, it must alter the whole system of fortification as well as of attack and defence; for every part of the city that is exposed to the view of the besiegers may be easily set in a flame, and the besieged would have the same advantage over the camp of the besieging army.\*

We are already completely tired of Syracuse, which, of all the wretched places we have yet met with, is by many degrees the most wretched; for, besides that its inhabitants are so extremely poor and beggarly, many of them are so overrun with the itch, that we are under perpetual apprehensions, and begin to be extremely well satisfied that we could not procure beds. It is truly melancholy to think of the dismal contrast that its former magnificence makes with its present meanness. The mighty Syracuse, the most opulent and powerful of all the Grecian cities, which, by its own proper strength alone, was able, at different times, to contend against all the power of Carthage and of Rome—which is recorded (what the force of united nations is now incapable of) to have repulsed fleets of two thousand sail, and armies of two hundred thousand men, and contained within its own walls, what no city ever did before or since, fleets and armies that were the terror of the world—this haughty and magnificent city, reduced even below the consequence of the most insignificant burgh: "*Sic transit gloria mundi*." I have not been able to procure a table to write upon, but, by way of succedaneum, am obliged to lay a form over the back of two chairs. We have got into the most wretched hovel you can conceive, and the most dirty; but what is still worst of all, we can find nothing to eat; and if we had not brought some cold fowls along with us, we might have starved.

\* Since the writing of these letters, the author has been informed that Mr Buffon actually made this experiment. He constructed a kind of frame, in which were fixed four hundred small mirrors, disposed in such a manner that the rays reflected from each of them fell exactly on the same point. By means of this he melted lead at the distance of one hundred and twenty feet, and set fire to a hay-stack at a much greater distance.

The heat has been considerably greater here than at Catania. The thermometer is just now at 78 degrees. There is an old remark made on the climate of this place by some of the ancients, which is still said to hold good, that at no season the sun has ever been invisible during a whole day at Syracuse. I find it mentioned by several Sicilian authors, but shall not vouch for the truth of it. Adieu. My next will probably be from Malta, for we shall sail to-morrow, if it be possible to procure a vessel. Ever yours.

~~~~~

### VOYAGE TO MALTA.

#### *Capo Passero, June 3.*

As we found the mighty city of Syracuse so reduced that it could not afford beds and lodging to three weary travellers, we agreed to abridge our stay in it, and accordingly hired a Maltese sponararo to carry us to that island. This is a small six-oared boat, made entirely for speed, to avoid the African pirates and other Barbareque vessels, with which these seas are infested, but so flat and so narrow, that they are not able to bear any sea, and of consequence keep always as near the coast as possible.

On the 2d of June, by daybreak, we left the Marmoreo, or great port of Syracuse; and although the wind was exactly contrary and pretty strong, by the force of their oars, which they manage with great dexterity, we got on at the rate of four miles an hour. They do not pull their oars as we do, but push them like the Venetian gondoliers, always fronting the prow of the boat, and seldom or never sit down while they row, allowing the whole weight of their bodies to be exerted every stroke of the oar. This gives a prodigious momentum, and is certainly much more forcible than a simple exertion of the muscles of the arm.

At ten o'clock the wind became favourable, when we went indeed at an immense rate. At twelve it blew a hurricane, and with some difficulty we got under shore, but the wind was so exceedingly violent, that even there we had like to have been overset, and we were obliged to run aground to save us from that disaster. Here we were a good deal annoyed by the sand carried about by the wind; however, the hurricane was soon over, and we again put to sea with a favourable gale, which in a few hours carried us to Capo Passero.

In this little storm we were a good deal amused with the behaviour of our Sicilian servant, who at land is a fellow of undaunted courage, of which we have had many proofs; but here (I don't know why) it entirely forsook him, although there was in fact no real danger, for we never were more than a hundred yards from the shore. He gave himself up to despair, and called upon all his saints for protection, and never again recovered his confidence all the rest of this little voyage, perpetually wishing himself back at Naples, and swearing that no earthly temptation should ever induce him to go to sea again. The same fellow, but a few days ago, mounted a most vicious horse, and without the least fear or concern, galloped along the side of a precipice, where every moment we expected to see him dashed to pieces; so singular and various are the different modes of fear and of courage.

Capo Passero, anciently called Pachinus, is the remotest and most southerly point of Sicily. It is not a peninsula, as represented in all the maps, but a wretched barren island of about a mile round, with a fort and a small garrison to protect the neighbouring country from the incursions of the Barbary corsairs, who are often very troublesome on this part of the coast. This little island and fort lie about a mile and a half distant from the small creek of which we have taken possession, and are separated from the rest of Sicily by a strait of about half a mile broad.

Our pilot told us we must not think of Malta, which

is almost a hundred miles off, till there were more settled appearances of good weather.

As there is no habitation here of any kind, we searched about till at last we found a small cavern, where we made a very comfortable dinner. We then sallied forth to examine the face of the country, as well as to try if we could shoot something for our supper. We found that we had now got into a very different world from any thing we had yet seen. The country here is exceedingly barren, and to a considerable distance produces neither corn nor wine; but the fields are adorned with an infinite variety of flowers and of flowering shrubs, and the rocks are every where entirely covered with capers, which are just now fit for gathering. If we had vinegar, we could soon pickle hogsheds of them.

We found here, in the greatest perfection, that beautiful shrub called the palmeta, resembling a small palm-tree, with an elegant fine flower; but, to our great mortification, the seed is not yet ripe. We likewise found great quantities of a blue everlasting flower, which I don't remember to have seen in Miller, or any of our botanical books. The stem rises about a foot high, and is crowned with a large cluster of small blue flowers, the leaves of which are of a dry substance like the elychnisum, or globe amaranthus. Some of these are of a purple colour, but most of them blue. I have gathered a pretty large quantity for the speculation of the botanists on our return.

We found a good swimming-place, which is always one of the first things we look out for, as this exercise constitutes one of the principal pleasures of our expedition.

As soon as it was dark, we got on board our little boat, and rowed about a hundred yards out to sea, where we cast anchor; our pilot assuring us that this was absolutely necessary, as the people in this part of the country are little better than savages; and, were we to stay on land, might very possibly come down during the night, and rob and murder us.

He likewise told us that the Turks had made frequent invasions upon this point of the island, which of all others lay most exposed to their depredations; that lately three of their chebecks ran into a small harbour a few miles from this, and carried off six merchant ships; and that very often some of their light vessels were seen hovering off the coast; that the only way to be in perfect security from these two enemies by sea and land, was to choose a place on the coast so deep that the banditti by land could not wade in to us; and at the same time so shallow as to be equally inaccessible to the banditti by sea.

When we found ourselves thus in security on both hands, we wrapt ourselves up in our cloaks, and fell asleep: however, we had but a very uncomfortable night; the wind rose, and the motion of our little bark was exceedingly disagreeable, and made us heartily sick. As soon as day began to appear, we made them pull into shore, when we were immediately cured of our sickness; and as the weather continues still unfavourable, we have fallen upon a variety of amusements to pass the time.

We have been thrice in the water, which is warm and pleasant; and in the intervals I have written you this letter on the top of a large basket, in which we carry our sea-store. We have likewise gathered shells, pieces of coral, of sponge, and several beautiful kinds of sea-weed. The rocks here are all of sand and gravel run together, and become as hard as granite. There are many shells and other marine substances mixed in their composition, which renders them objects of curiosity in the eye of a naturalist.

This morning we made a kind of tent of a sail, drawn over the point of a rock, and fixed with an oar, by way of pole. Here we breakfasted most luxuriously on excellent tea and honey of Hybla.

I was interrupted in this part of my letter by an officer from the fort of Capo Passero. He tells us

that we may give over all thoughts of getting farther for these six days. What do you think is his reason? I own I was in some pain till he mentioned it. This wind set in exactly as the moon entered her second quarter, and it will certainly continue till she is full. There is a rascal for you! If he be telling truth, I shall certainly study astrology. He likewise told us, that two galliots had been seen off the coast, and desired us to be upon our guard; but I own the moon, together with other circumstances, has considerably weakened his evidence with me.

We have learned from his conversation, that the fort of Capo Passero is made use of as a place of exile for the delinquents in the army, of which number I have not the least doubt that he is one. He told us there were two near relations of the viceroy that had been lately sent there for misdemeanours; that for his part, he belonged to a very agreeable garrison; but as he loved retirement, he chose to accompany them. However, his countenance told a very different story; and said, in strong language, that he was a *tres mauvais sujet* [a very bad subject]. Besides, he is a stupid fellow, and has tired me. I could learn nothing from him.

It must be owned, this is an excellent place of exile for a young rake who wants to show away in the *beau monde*. It is not within many miles of any town or village, so that the gentleman may enjoy retirement in its utmost perfection.

We were surprised to find on this coast quantities of the true pumice-stone, which at first we supposed to have been brought by the sea from Ætna, till we likewise discovered many large pieces of lava, which makes us imagine there must have been some eruption of fire in this part of the island; yet I see no conical mountain, or any other indication of it.

If our officer's prognostications prove true, and we are detained here any longer, I shall examine the country to a much greater distance. The wind continues directly contrary; the sea is very high in the canal of Malta, and our Sicilian servant is in a sad trepidation. But I see Glover and Fullarton coming for their dinner, so I shall be obliged to give up the basket. This sea air gives one a monstrous appetite, and it is with grief that I mention it, we are already brought to short allowance—only one cold fowl amongst three of us, all three pretty sharp set, I assure you. Those infamous rascals, to lose our turtle! They have spied a fishing-boat, and are hailing her as loud as they can roar—but, alas! she is too far off to hear them. They have just fired a gun to bring her to, and happily she obeys the signal, so there is still hopes; otherwise we shall soon be reduced to bread and water. Our tea and sugar, too, are just upon a close, which is the cruelest article of all; but we have plenty of good bread and Hybla honey, so we are in no danger of starving.

We have likewise made an admirable and a very comfortable disposition for our night's lodging. The spononaro is so very narrow that it is impossible for us all to lie in it; besides, we are ate up with vermin, and have nothing but the hard boards to lie on: all these considerations, added to the cursed swinging of the boat, and the horrid sickness it occasions, have determined us rather to trust ourselves to the mercy of the banditti than to lie another night at sea; besides, we have made the happiest discovery in the world—a great quantity of fine, soft, dry sea-weed, lying under the shelter of a rock, and seemingly intended by providence for our bed; over this we are going to stretch a sail, and expect to sleep most luxuriously; but, to prevent all danger from a surprise, we have agreed to stand sentry by turns, with Fullarton's double-barrelled gun, well primed and loaded for the reception of the enemy, at the first discharge of which, and not before, the whole guard is to turn out, with all the remaining part of our artillery and small arms, and, as our situation is a very advanta-

geous one, I think we shall be able to make a stout defence.

As we are six in number, three masters and three servants, the duty, you see, will be but trifling, and five of us will always sleep in security. Our guard, to be sure, might have been stronger, but our sparano men have absolutely refused to be of the party, having much more confidence in their own element; however, they have promised, in case of an attack, immediately to come to our assistance. I think the disposition is far from being a bad one, and we are not a little vain of our generalship.

The fishing-boat is now arrived, and they have brought some excellent little fishes, which are already on the fire. Adieu. These fellows are roaring for their cold fowl, and I can command the basket no longer. Ever yours.

#### ARRIVAL IN MALTA.

*Malta, June 4.*

In spite of appearances, and our officer's wise prognostications, the wind changed in the afternoon, and we got under sail by six o'clock; we passed the straits, and coasted along till eight, when we landed to cook some macaroni we had purchased of our sailors, and try if we could shoot something for sea-store, as we have still a long voyage before us.

We came to the side of a sulphurous lake, the smell of which was so strong that we perceived it upwards of a mile distant. We found the water boiling up with violence in many places, though the heat at the banks of the lake is very inconsiderable. However, this, added to the pumice and lava we found near Capo Passero, tends greatly to confirm us in the opinion that this part of the island, as well as about *Ætna*, has in former ages been subject to eruptions of fire.

I think it is more than probable that this is the celebrated *Camerina*, which *Æneas* saw immediately after his passing *Pachynus* (or *Capo Passero*), which *Virgil* says the Fates had decreed should never be drained:

*Hinc altas cautes projectaque saxa Pachyni  
Radimus; et fatis nunquam concessa moveri  
Adparet Camarina procul.*

[Then, doubling *Capo Pachynus*, we survey  
The rocky shore extended to the sea.  
The town of *Camarina* from far we see,  
And fenny lake, undrain'd by fate's decree.]

*Virgil* had good reason to say so, for the level of the lake or marsh (it being somewhat betwixt the two), is at least as low as that of the sea, and consequently never could be drained.

It is surrounded with a variety of fine evergreens and flowering shrubs, of which the palmeta, and the arbutus or strawberry tree, are the most beautiful. We saw a great many wild-fowl, but what surprised me, in so unfrequented a place, they were so shy that there was no getting near them: there was one kind, in particular, that attracted our attention; it was of the size and form of a grey plover, and flew in the same manner, but had a tail of a great length, which seemed to be composed only of two small flexible feathers, that made a very uncommon appearance in the air. After using all our art to shoot one of them, we were obliged to give up the attempt.

Here we killed a small black snake, which I think answers the description I have seen of the asp. We dissected out its tongue, the end of which appears sharp like a sting, and I suppose is one, as it darted out with violence against our sticks when we presented them to it. Now, as all animals, when attacked, make use of those weapons that nature has armed them with for their defence, it appeared evident to us (supposing this rule a just one), that this animal was conscious

of a power of hurting in its tongue, and we have been more fully convinced of it from dissection. The sting appears considerably larger than that of a bee. We found a little bag at the other end of the tongue, and probably, if we had had a microscope, should have found the tongue perforated. This snake had no teeth, but very hard gums. I have taken care to preserve the tongue for your inspection.

As I think it has always been supposed that serpents hurt only with their teeth, I thought this might be worthy of your notice. It is true that the darting out of the tongue is a trick of the whole serpent tribe; but this animal seemed to do it with peculiar ferocity, and to strike it with violence against our sticks. It was this that put us upon the examination.

I don't recollect that this singularity is mentioned in any book of natural history, but possibly I may be mistaken; nor indeed do I remember either to have seen or heard of any animal armed in this manner—unless you will suppose me to adopt the sentiments of poor Mr S—, who, ever since his marriage, alleges that the tongues of many females are formed after this singular fashion, and remarks one peculiarity, that the sting seldom or never appears till after matrimony. He is very learned on this subject, and thinks it may possibly have proceeded from their original connexion with the serpent. Let this be as it may, I sincerely hope that you and I shall never have such good reason for adopting that opinion.

A little after nine we embarked. The night was delightful, but the wind had died away about sunset, and we were obliged to ply our oars to get into the canal of *Malta*. The coast of *Sicily* began to recede, and in a short time we found ourselves in the ocean. There was a profound silence, except the noise of the waves breaking on the distant shore, which only served to render it more solemn. It was a dead calm, and the moon shone bright on the waters. The waves from the late storm were still high, but smooth and even, and followed one another with a slow and equal pace. The scene had naturally sunk us into meditation: we had remained near an hour without speaking a word, when our sailors began their midnight hymn to the *Virgin*. The music was simple, solemn, and melancholy, and in perfect harmony with the scene and with all our feelings. They beat exact time with their oars, and observed the harmony and the cadence with the utmost precision. We listened with infinite pleasure to this melancholy concert, and felt the vanity of operas and oratorios. There is often a solemnity and a pathos in the modulation of these simple productions, that causes a much stronger effect than the composition of the greatest masters, assisted by all the boasted rules of counter-point.

At last they sung us asleep, and we awoke forty miles distant from *Sicily*. We were now on the main ocean, and saw no land but *Mount Ætna*, which is the perpetual polar star of these seas. We had a fine breeze, and about two o'clock we discovered the island of *Malta*, and in less than three hours more reached the city of *Valetta*. The approach of the island is very fine, although the shore is rather low and rocky. It is every where made inaccessible to an enemy by an infinite number of fortifications. The rock in many places has been sloped into the form of a glacis, with strong parapets and intrenchments running behind it. The entry into the port is very narrow, and is commanded by a strong castle on either side. We were hailed from each of these, and obliged to give a strict account of ourselves, and on our arrival at the side of the quay we were visited by an officer from the health office, and obliged to give oath with regard to the circumstances of our voyage. He behaved in the civilest manner, and immediately sent us Mr *Rutter*, the English consul, for whom we had letters of recommendation.

On getting on shore we found ourselves in a new world indeed—the streets crowded with well-dressed

people, who have all the appearance of health and affluence, whereas at Syracuse, there was scarce a creature to be seen, and even those few had the appearance of disease and wretchedness. Mr Rutter immediately conducted us to an inn, which had more the appearance of a palace. We have had an excellent supper, and good Burgundy; and as this is the king's birthday, we have almost got tipsy to his health. We are now going into clean comfortable beds, in expectation of the sweetest slumbers. Think of the luxury of this, after being five long days without throwing off our clothes! Good night. I would not lose a moment of it for the world. People may say what they please, but there is no enjoyment in living in perpetual ease and affluence, and the true luxury is only to be attained by undergoing a few hardships. But this is no time to philosophise. So adieu.

#### MALTA.—FORTRESS OF VALETTA.

*Malta, June 5.*

OUR banker, Mr Pousilach, was here before we were up, inviting us to dine with him at his country-house, from whence we are just now returned. He gave us a noble entertainment, served on plate, with an elegant dessert, and a great variety of wines.\*

\* [Malta is sixty miles in circumference, twenty long, and two broad; situated in latitude 35° 53' N., and longitude 14° 30' E. (calculated for the site of the observatory). It is 60 miles from Sicily, and 200 from Calipia, the nearest point of the African coast. A smaller island named Gozo, and a rock named Cumino, are usually considered as, with Malta, forming one group of islands. The population of the whole was once 114,000, now only 94,000. Malta is mentioned by Homer in his *Odyssey*, under the name of *Hyperia*. The basis of the population is Arabian, with an admixture of the neighbouring European nations, particularly the Italian; and the language corresponds with and confirms this view of their origin. About 1519 years before Christ, the Phœnicians, conceiving that it might be rendered an useful commercial station, seized upon the island, and established a colony on its shores. In process of time, it was taken possession of by the Greeks, from whom it passed successively into the hands of the Carthaginians, Romans, Vandals and Goths, Arabs, Normans, Germans, French, and Spaniards, with whom it remained until the year 1530. At that period, the Emperor Charles V., finding the support of its garrison expensive, ceded the perpetual sovereignty of Malta and its dependencies, together with the city of Tripoli, to the Knights Hospitallers of St John of Jerusalem, who, having been expelled from Rhodes by the Turks, were at this time wandering over the Mediterranean in quest of an asylum. This order was instituted about the end of the eleventh century, and was originally composed of a few charitable individuals, who established a house at Jerusalem for the reception of the sick and wounded crusaders. In time it became a powerful religious society, of a military character; and, with professions on its lips of poverty and humility, was practically rich, luxurious, and profligate. It was divided into seven different languages, of which the three first were French, namely, those of Provence, Auvergne, and France; the four others were those of Italy, Arragon, England, and Germany. The language of Castile was afterwards added; and that of England, abolished at the Reformation, was replaced by the Anglo-Bavarian. There was a more important division of the order into three classes, the first consisting solely of persons of noble birth, and called *Chevaliers de Justice*; the second comprehending the *Priests* of the order; the third being composed of inferior persons, styled *Servans d'armes*, and corresponding to the *squires* of the chivalrous era.—*Edinburgh Review*, vi. 206. The professed objects of the Knights of St John, from an early period of their history, were to make war on the infidels, namely, the Turks and other Mohammedans. Latterly, however, the order and its funds were only a means of providing for the younger sons of noble families throughout Europe. Their spirit having greatly declined, they yielded up their impregnable island to General Bonaparte in 1798, when he was on his way to Egypt. The French banished the order, and seized all their valuables. In 1800, after enduring a protracted siege, the French garrison surrendered the island to the British, to whom it was definitively assigned by the congress

After dinner we went to visit the principal villas of the island, particularly those of the grand master and the general of the galleys, which lie contiguous to each other. These are nothing great or magnificent, but they are admirably contrived for a hot climate, where, of all things, shade is the most desirable. The orange groves are indeed very fine, and the fruit they bear is superior to any thing you have seen in Spain or Portugal.

The aspect of the country is far from being pleasing: the whole island is a great rock of very white freestone,\* and the soil that covers this rock, in most places, is not more than five or six inches deep; yet, what is singular, we found their crop in general was exceedingly abundant. They account for it from the copious dews that fall during the spring and summer months; and pretend likewise, that there is a moisture in the rock below the soil, that is of great advantage to the corn and cotton, keeping its roots perpetually moist and cool, without which singular quality, they say, they could have no crops at all, the heat of the sun is so exceedingly violent.

Their barley harvest has been over some time ago, and they are just now finishing that of the wheat. The whole island produces corn only sufficient to support its inhabitants for five months, or little more; but the crop they most depend upon is the cotton. They began sowing it about three weeks ago, and it will be finished in a week more. The time of reaping it is in the month of October and beginning of November.

They pretend that the cotton produced from this plant, which is sown and reaped in four months, is of a much superior quality to that of the cotton-tree. I compared them, but I cannot say I found it so; this is indeed the finest, but that of the cotton-tree is by much the strongest texture. The plant rises to the height of a foot and a half, and is covered with a number of nuts or pods full of cotton; these, when ripe, they are at great pains to cut off every morning before sunrise, for the heat of the sun immediately turns the cotton yellow, which, indeed, we saw from those pods they save for seed.

They manufacture their cotton into a great variety of stuffs. Their stockings are exceedingly fine. Some of them, they assured us, had been sold for ten sequins a-pair. Their coverlets and blankets are esteemed all over Europe. Of these the principal manufactures are established in the little island of Gozo, where the people are said to be more industrious than those of Malta, as they are more excluded from the world, and have fewer inducements to idleness. Here the sugarcane is still cultivated with success, though not in any considerable quantity.

The Maltese oranges certainly deserve the character they have of being the finest in the world. The season continues for upwards of seven months, from November till the middle of June, during which time those beautiful trees are always covered with abundance of this delicious fruit. Many of them are of the red kind, much superior, in my opinion, to the others,

of Vienna, in 1814. It has since then remained under the British government.

The support of the Maltese having previously been of an extrinsic kind, they have, since the loss of their knights, been sunk in great poverty, and their number is much fallen off. Yet it is considered as still one of the most densely peopled spots of earth in Europe. It has been calculated that an extent of ground which in England supports 152 persons, contains in Malta eight times that number. This is owing to the low moral and intellectual state of the people. The poverty of the humbler orders is shown strikingly in the low price of all provisions. There is a saying in the island, that a man may dine on fish, flesh, and fowl for a halfpenny. A shopkeeper will not refuse to serve some portion of cooked meat for even a single grain, the sixth part of a halfpenny. But then, to obtain a grain or a halfpenny by labour in Malta is more difficult than in other countries to win a shilling or half-a-crown.—*Athenæum*, No. 504.]

\* [The rock is in reality of a calcareous nature.]

which are rather too luscious. They are produced, I am told, from the common orange bud, engrafted on the pomegranate stock. The juice of this fruit is red as blood, and of a fine flavour. The greatest part of their crop is sent in presents to the different courts of Europe, and to the relations of the chevaliers. It was not without a good deal of difficulty that we procured a few chests for our friends at Naples.

The industry of the Maltese in cultivating their little island is inconceivable. There is not an inch of ground lost in any part of it; and where there was not soil enough, they have brought over ships and boats loaded with it from Sicily, where there is plenty and to spare. The whole island is full of enclosures of freestone, which gives the country a very uncouth and a very barren aspect, and in summer reflects such a light and heat, that it is exceedingly disagreeable and offensive to the eyes. The enclosures are very small and irregular, according to the inclination of the ground. This, they say, they are obliged to observe, notwithstanding the deformity it occasions, otherwise the floods to which they are subject would soon carry off their soil.

The island is covered over with country houses and villages, besides seven cities, for so they term them; but there are only two, the Valetta and the Citta Vecchia, that by any means deserve that appellation. Every little village has a noble church, elegantly finished and adorned with statues of marble, rich tapestry, and a large quantity of silver plate. They are by much the handsomest country churches I have ever seen. But I am interrupted in my writing, by the beginning (I am told) of a very fine show. If it be so, I shall give you some account of it by and by.

*Eleven at night.*—The show is now finished, and has afforded us great entertainment. It was the departure of a Maltese squadron to assist the French against the Bey of Tunis, who, it seems, has fallen under the displeasure of the *grand monarque*, because he refused to deliver up without ransom the Corsican slaves that were taken before the French were in possession of that island. The squadron consisted of three galleys, the largest with nine hundred men, each of the others with seven hundred; three galliots, and several scampavias, so called from their exceeding swiftness. These immense bodies were all worked by oars, and moved with great regularity. The admiral went first, and the rest in order, according to their dignity. The sea was crowded with boats, and the ramparts and fortifications were filled with the company. The port resounded on all sides with the discharge of heavy artillery, which was answered by the galleys and galliots as they left the harbour. As the echo is here uncommonly great, it produced a very noble effect.

There were about thirty knights in each galley, making signals all the way to their mistresses, who were weeping for their departure upon the bastions; for these gentlemen pay almost as little regard to their vows of chastity as the priests and confessors do. After viewing the show from the ramparts, we took a boat and followed the squadron for some time, and did not return till long after sunset.

We have been admiring the wonderful strength of this place, both by nature and art. It is certainly the happiest situation that can be imagined. The city stands upon a peninsula, betwixt two of the finest ports in the world, which are defended by almost impregnable fortifications. That on the south-east side of the city is the largest. It runs about two miles into the heart of the island, and is so very deep, and surrounded by such high grounds and fortifications, that they assured us the largest ships of war might ride here in the most stormy weather, almost without a cable.

This beautiful basin is divided into five distinct harbours, all equally safe, and each capable of containing an immense number of shipping. The mouth

of the harbour is scarcely a quarter of a mile broad, and is commanded on each side by batteries that would tear the strongest ship to pieces before she could enter. Besides this, it is fronted by a quadruple battery, one above the other, the largest of which is a *fleur d'eau*, or on a level with the water. These are mounted with about eighty of their heaviest artillery; so that this harbour, I think, may really be considered as impregnable, and indeed the Turks have ever found it so, and I believe ever will.

The harbour on the north side of the city, although they only use it for fishing, and as a place of quarantine, would, in any other part of the world, be considered as inestimable. It is likewise defended by very strong works; and in the centre of the basin there is an island on which they have built a castle and a lazaret.

The fortifications of Malta are indeed a most stupendous work. All the boasted catacombs of Rome and Naples are a trifle to the immense excavations that have been made in this little island. The ditches, of a vast size, are all cut out of the solid rock. These extend for a great many miles, and raise our astonishment to think that so small a state has ever been able to make them.

One side of the island is so completely fortified by nature, that there was nothing left for art. The rock is of a great height, and absolutely perpendicular from the sea for several miles. It is very singular, that on this side there are still the vestiges of several ancient roads, with the tracks of carriages worn deep in the rocks: these roads are now terminated by the precipice, with the sea beneath, and show, to a demonstration, that this island has in former ages been of a much larger size than it is at present; but the convulsion that occasioned its diminution is probably much beyond the reach of any history or tradition. It has often been observed, notwithstanding the very great distance of Mount *Ætna*, that this island has generally been more or less affected by its eruptions; and they think it probable that, on some of those occasions, a part of it may have been shaken into the sea.

We have now an opportunity of observing that one-half of Mount *Ætna* is clearly discovered from Malta. They reckon the distance at near two hundred Italian miles. And the people here assure us, that in the great eruptions of that mountain, their whole island is illuminated, and from the reflection in the water there appears a great track of fire in the sea all the way from Malta to Sicily. The thundering of the mountain is likewise distinctly heard. Good night. I am fatigued with this day's expedition, and shall finish my letter to-morrow.

*June 6.*—As the city of Valetta is built upon a hill, none of the streets except the quay are level. They are all paved with white freestone, which not only creates a great dust, but from its colour is likewise so offensive to the eyes, that most of the people here are remarkably weak-sighted. The principal buildings are the palace of the grand master, the infirmary, the arsenal, the inns or hotels of the Seven Tongues, and the great church of St John. The palace is a noble though a plain structure, and the grand master (who studies convenience more than magnificence) is more comfortably and commodiously lodged than any prince in Europe, the King of Sardinia perhaps only excepted. The great stair is the easiest and the best I ever saw.

St John's is a magnificent church. The pavement, in particular, is reckoned the richest in the world. It is entirely composed of sepulchral monuments of the finest marbles, porphyry, lapis lazuli, and a variety of other valuable stones admirably joined together, and at an incredible expense, representing in a kind of mosaic the arms, insignia, &c., of the persons whose names they are intended to commemorate. In the magnificence of these monuments, the heirs of the grand masters and commanders have long vied with each other.

We went this day to see the celebration of their church service. It seems to be more overcharged with parade and ceremony than what I have ever observed even in any other Catholic country. The number of genuflections before the altar, the kissing of the prior's hand, the holding up of his robes by subaltern priests, the ceremony of throwing incense upon all the knights of the great cross, and neglecting the poorer knights, with many other articles, appeared to us highly ridiculous, and most essentially different indeed from that purity and simplicity of worship that constitutes the very essence of true Christianity, and of which the great pattern they pretend to copy set so very noble an example.

This day (the 6th of June) is held as a thanksgiving for their deliverance from a terrible conspiracy that was formed about twenty-one years ago by the Turkish slaves, at one stroke to put an end to the whole order of Malta. All the fountains of the place were to be poisoned, and every slave had taken a solemn oath to put his master to death.

It was discovered by a Jew who kept a coffeehouse. He understood the Turkish language, and overheard some discourse that he thought suspicious. He went immediately and informed the grand master. The suspected persons were instantly seized and put to the torture, and soon confessed the whole plot. The executions were shocking. One hundred and twenty-five were put to death by various torments. Some were burned alive, some were broken on the wheel, and some were torn to pieces by four galleys rowing different ways, and each bringing off its limb. Since that time the slaves have been much more strictly watched, and have less liberty than formerly. Adieu. I shall write to you again before we leave Malta. Yours, &c.

MELITA.—KNIGHTS OF ST JOHN.—DUELLING.

*Malta, June 7.*

THIS day we made an expedition through the island in coaches drawn by one mule each, the only kind of vehicle the place affords. Our conductors could speak nothing but Arabic, which is still the language of the common people of Malta, so that you may believe we did not reap much benefit from their conversation. We went first to the ancient city of Melita, which is near the centre of the island, and commands a view of the whole, and in clear weather, they pretend, of part of Barbary and of Sicily. The city is strongly fortified, and is governed by an officer called the Hahem. He received us very politely, and showed us the old palace, which is not indeed much worth the seeing. The cathedral is a very fine church, and, although of an exceeding large size, is at present entirely hung with crimson damask richly laced with gold.

The catacombs, not far from the city, are a great work. They are said to extend for fifteen miles under ground; however, this you are obliged to take on the credit of your guides, as it would rather be risking too much to put it to the trial. Many people, they assure us, have been lost in advancing too far in them, the prodigious number of branches making it next to impossible to find the way out again.

From this we went to see the Bosquetta, where the grand master has his country palace; by the accounts we had of it at Valetta, we expected to find a forest stored with deer and every kind of game, as they talked much of the great hunts that were made every year in these woods. We were not a little surprised to find only a few scattered trees, and about half a dozen deer; but as this is the only thing like a wood in the island, it is esteemed a very great curiosity. The palace is as little worth seeing as the forest, though the prospect from the top of it is very fine. The furniture is three or four hundred years old, and

in the most Gothic taste that can be imagined; but, indeed, the grand master seldom or never resides here.

The great source of water that supplies the city of Valetta, takes its rise near to this place, and there is an aqueduct composed of some thousand arches, that conveys it from thence to the city. The whole of this immense work was finished at the private expense of one of the grand masters.

Not far from the old city there is a small church dedicated to St Paul; and just by the church a miraculous statue of the saint with a viper on his hand, supposed to be placed on the very spot on which the house stood where he was received after his shipwreck on this island, and where he shook the viper off his hand into the fire without being hurt by it; at which time, the Maltese assure us, the saint cursed all the venomous animals of the island, and banished them for ever, just as St Patrick treated those of his favourite isle. Whether this be the cause of it or not, we shall leave to divines to determine (though if it had, I think St Luke would have mentioned it in the Acts of the Apostles), but the fact is certain, that there are no venomous animals in Malta. They assured us that vipers had been brought from Sicily, and died almost immediately on their arrival.\*

Adjoining to the church, there is the celebrated grotto, in which the saint was imprisoned. It is looked upon with the utmost reverence and veneration; and if the stories they tell of it be true, it is well entitled to it all. It is exceedingly damp, and produces (I believe by a kind of petrification from the water) a whitish kind of stone, which they assure us, when reduced to powder, is a sovereign remedy in many diseases, and saves the lives of thousands every year. There is not a house in the island that is not provided with it; and they tell us there are many boxes of it sent annually, not only to Sicily and Italy, but likewise to the Levant and the East Indies; and (what is considered a daily standing miracle) notwithstanding this perpetual consumption, it has never been exhausted, nor even sensibly diminished, the saint always taking care to supply them with a fresh quantity the day following.

You may be sure we did not fail to stuff our pockets with this wonderful stone: I suspected they would have prevented us, as I did not suppose the saint would have worked for heretics; however, neither he nor the priests had any objection, and we gave them a few *pauls*† more for their civility. I tasted some of it, and believe it is a very harmless thing. It tastes like exceeding bad magnesia, and I believe has pretty much the same effects. They give about a tea-spoonful of it to children in the small-pox and in fevers. It produces a copious sweat about half an hour after, and, they say, never fails to be of service. It is likewise esteemed a certain remedy against the bite of all venomous animals. There is a very fine statue of St Paul in the middle of this grotto, to which they ascribe great powers.

We were delighted, on our way back to the city, with the beauty of the setting sun, much superior, I think, to what I have ever observed it in Italy. The whole of the eastern parts of the heavens, for half an hour after sunset, was of a fine deep purple, and made a beautiful appearance; this the Maltese tell us is generally the case every evening at this season of the year.

I forgot to say any thing of our presentation to the grand master, for which I ask pardon both of you and him. His name is Pinto, and of a Portuguese family. He has now been at the head of this singular little state for upwards of thirty years. He received us with great politeness, and was highly pleased to find that some of us had been in Portugal. He mentioned

\* [The author of a lately published volume, entitled "the Life of St Paul," shows good reasons for concluding that the island on which St Paul landed was not Malta, but a small isle in the Adriatic.]

† A small silver coin.

the intimate commercial connexions that had so long subsisted betwixt our nations, and expressed his desire of being of service to us, and of rendering our stay in his island as agreeable as possible. He is a clear-headed, sensible, little old man, which, at so advanced a period of life, is very uncommon. Although he is considerably upwards of ninety, he retains all the faculties of his mind in perfection. He has no minister, but manages every thing himself, and has immediate information of the most minute occurrences. He walks up and down stairs, and even to church, without assistance, and has the appearance as if he would still live for many years. His household attendance and court are all very princely; and, as grand master of Malta, he is more absolute, and possesses more power than most sovereign princes. His titles are Serene Highness and Eminence; and as he has the disposal of all lucrative offices, he makes of his councils what he pleases; besides, in all the councils that compose the jurisdiction of this little nation, he himself presides, and has two votes. Since he was chosen grand master, he has already given away one hundred and twenty-six commanderies, some of them worth upwards of £2000 a-year, besides priories and other offices of profit. He has the disposal of twenty-one commanderies and one priory every five years, and as there are always a number of expectants, he is very much courted.

He is chosen by a committee of twenty-one, which committee is nominated by the seven nations, three out of each nation. The election must be over within three days after the death of the former grand master, and during these three days, there is scarce a soul that sleeps at Malta—all is cabal and intrigue; and most of the knights are masked, to prevent their particular attachments and connexions from being known; the moment the election is over, every thing returns again to its former channel.

The land force of Malta is equal to the number of men in the island fit to bear arms. They have about five hundred regulars belonging to the ships of war, and one hundred and fifty compose the guard of the prince. The two islands of Malta and Gozo contain about one hundred and fifty thousand inhabitants. The men are exceedingly robust and hardy. I have seen them row from ten to twelve hours without intermission, and without even appearing to be fatigued.

Their sea force consists of four galleys, three galliots, four ships of sixty guns, and a frigate of thirty-six, besides a number of the quick-sailing little vessels called scampavias, literally, runaways. Their ships, galleys, and fortifications, are not only supplied with excellent artillery, but they have likewise invented a kind of ordnance of their own, unknown to all the world besides; for we found to our no small amazement, that the rocks were not only cut into fortifications, but likewise into artillery, to defend these fortifications, being hollowed out in many places into the form of immense mortars. The charge is said to be about a barrel of gunpowder, over which they place a large piece of wood, made exactly to fit the mouth of the chamber. On this they heap a great quantity of cannon-balls, shells, or other deadly materials; and when an enemy's ship approaches the harbour, they fire the whole into the air, and they pretend it produces a very great effect, making a shower for two or three hundred yards round that would sink any vessel. Notwithstanding the supposed bigotry of the Maltese, the spirit of toleration is so strong, that a mosque has lately been built for their sworn enemies the Turks. Here the poor slaves are allowed to enjoy their religion in peace. It happened lately that some idle boys disturbed them during their service; they were immediately sent to prison, and severely punished. The police, indeed, is much better regulated than in the neighbouring countries, and assassinations and robberies are very uncommon; the last of which crimes the grand master punishes with the utmost severity.

But he is said, perhaps in compliance with the prejudice of his nation, to be much more relax with regard to the first.

Perhaps Malta is the only country in the world where duelling is permitted by law. As their whole establishment is originally founded on the wild and romantic principles of chivalry, they have ever found it too inconsistent with those principles to abolish duelling; but they have laid it under such restrictions as greatly to lessen its danger. These are curious enough. The duellists are obliged to decide their quarrel in one particular street of the city; and if they presume to fight any where else, they are liable to the rigour of the law. But what is not less singular, and much more in their favour, they are obliged under the most severe penalties to put up their sword, when ordered so to do by a woman, a priest, or a knight.

Under these limitations, in the midst of a great city, one would imagine it almost impossible that a duel could ever end in blood; however, this is not the case; a cross is always painted on the wall opposite to the spot where a knight has been killed, in commemoration of his fall. We counted about twenty of these crosses.

About three months ago, two knights had a dispute at a billiard table. One of them, after giving a great deal of abusive language, added a blow; but, to the astonishment of all Malta (in whose annals there is not a similar instance), after so great a provocation, he absolutely refused to fight his antagonist. The challenge was repeated, and he had time to reflect on the consequences, but still he refused to enter the lists. He was condemned to make *amende honourable* in the great church of St John for forty-five days successively; then to be confined in a dungeon without light for five years, after which he is to remain a prisoner in the castle for life. The unfortunate young man who received the blow is likewise in disgrace, as he had not an opportunity of wiping it out in the blood of his adversary.

This has been looked upon as a very singular affair, and is still one of the principal topics of conversation. The first part of the sentence has already been executed, and the poor wretch is now in his dungeon. Nor is it thought that any abatement will be made in what remains.

If the legislature in other countries punished with equal rigour those that do fight, as it does in this those that do not, I believe we should soon have an end of duelling; but I should imagine the punishment for fighting ought never to be a capital one, but something ignominious; and the punishment for not fighting should always be so, or at least some severe corporal punishment;\* for ignominy will have as little effect on the person who will submit to the appellation of coward, as the fear of death on one who makes it his glory to despise it.

The Maltese still talk with horror of a storm that happened here on the 29th of October 1757, which, as it was of a very singular nature, I shall translate you some account of, from a little book they have given me, written on that subject.

About three quarters of an hour after midnight, there appeared to the south-west of the city a great black cloud, which, as it approached, changed its colour, till at last it became like a flame of fire mixed with black smoke. A dreadful noise was heard on its approach, that alarmed the whole city. It passed over part of the port, and came first upon an English ship, which in an instant was torn to pieces, and nothing left but the hulk; part of the masts, sails, and cordage, were carried along with the cloud to a considerable distance. The small boats and fellowes that fell in its way were all broken to pieces, and sunk. The noise increased, and became more frightful. A

\* [In the present age, few moralists would be found to sanction this opinion.]

sentinel, terrified at its approach, ran into his box; both he and it were lifted up, and carried into the sea, where he perished. It then traversed a considerable part of the city, and laid in ruins almost every thing that stood in its way. Several houses were laid level with the ground, and it did not leave one steeple in its passage. The bells of some of them, together with the spires, were carried to a considerable distance. The roofs of the churches were demolished and beat down, which, if it had happened in the day time, must have had dreadful consequences, as every one would immediately have run to the churches.

It went off at the north-east point of the city, and, demolishing the lighthouse, is said to have mounted up in the air with a frightful noise; and passed over the sea to Sicily, where it tore up some trees, and did other damage, but nothing considerable; as its fury had been mostly spent upon Malta. The number of killed and wounded amounted to near two hundred, and the loss of shipping, houses, and churches, was very considerable.

Several treatises have been written to account for this singular hurricane, but I have found nothing at all satisfactory. The sentiments of the people are concise and positive. They declare with one voice that it was a legion of devils let loose to punish them for their sins. There are a thousand people in Malta that will take their oath they saw them within the cloud, all as black as pitch, and breathing out fire and brimstone. They add, that if there had not been a few godly people amongst them, their whole city would certainly have been involved in one universal destruction.

The horse races of Malta are of a very uncommon kind. They are performed without either saddle, bridle, whip, or spur; and yet the horses are said to run full speed, and to afford a great deal of diversion. They are accustomed to the ground for some weeks before; and although it is entirely over rock and pavement, there are very seldom any accidents. They have races of asses and mules, performed in the same manner, four times every year. The rider is only furnished with a machine like a shoemaker's awl, to prick on his courser if he is lazy.

As Malta is an epitome of all Europe, and an assemblage of the younger brothers, who are commonly the best of its first families, it is probably one of the best academies for politeness in this part of the globe; besides, where every one is entitled by law as well as custom, to demand satisfaction for the least breach of it, people are under the necessity of being very exact and circumspect, both with regard to their words and actions.

All the knights and commanders have much the appearance of gentlemen and men of the world. We met with no character in the extreme. The ridicules and prejudices of every particular nation are by degrees softened and worn off by the familiar intercourse and collision with each other. It is curious to observe the effect it produces upon the various people that compose this little medley. The French skip, the German strut, and the Spanish stalk, are all mingled together in such small proportions, that none of them are striking; yet every one of these nations still retain something of their original characteristic; it is only the exuberance of it that is worn off; and it is still easy to distinguish the inhabitants of the south and north side of the Pyrenees, as well as those of the east and west side of the Rhine; for though the Parisian has, in a great measure, lost his assuming air, the Spaniard his taciturnity and solemnity, the German his formality and his pride, yet still you see the German, the Frenchman, and the Spaniard—it is only the caricature, that formerly made them ridiculous, that has disappeared.

This institution, which is a strange compound of the military and ecclesiastic, has now subsisted for nearly seven hundred years, and though I believe one of the first-born, has long survived every other child

of chivalry. It possesses great riches in most of the Catholic countries of Europe, and did so in England too before the time of Henry VIII.; but that capricious tyrant did not choose that any institution, however ancient or respected, should remain in his dominions that had any doubt of his supremacy and infallibility; he therefore seized on all their possessions at the same time that he enriched himself by the plunder of the church. It was in vain for them to plead that they were rather a military than an ecclesiastic order, and by their valour had been of great service to Europe in their wars against the infidels; it was not agreeable to his system ever to hear a reason for any thing, and no person could possibly be right that was capable of supposing that the king could be wrong.

Malta, as well as Sicily, was long under the tyranny of the Saracens, from which they were both delivered about the middle of the eleventh century by the valour of the Normans, after which time the fate of Malta commonly depended on that of Sicily, till the Emperor Charles V., about the year 1530, gave it, together with the island of Gozo, to the Knights of St John of Jerusalem, who at that time had lost the island of Rhodes. In testimony of this concession, the grand master is still obliged every year to send a falcon to the King of Sicily or his viceroy, and on every new succession to swear allegiance and to receive from the hands of the Sicilian monarch the investiture of these two islands.

Ever since our arrival here the weather has been perfectly clear and serene, without a cloud in the sky; and for some time after sunset the heavens exhibit a most beautiful appearance, which I don't recollect to have observed any where else. The eastern part of the hemisphere appears of a rich deep purple, and the western is the true yellow glow of Claude Lorrain, that you used to admire so much. The weather, however, is not intolerably hot; the thermometer stands commonly betwixt 75 and 76 degrees. Adieu. We are now preparing for a long voyage, and it is not easy to say from whence I shall write you next. Ever yours.

#### RETURN TO SICILY.

*Agirgentum, June 11.*

We left the port of Malta in a saronaro which we hired to convey us to this city.

We coasted along the island, and went to take a view of the north port, its fortifications and lazaretto. All these are very great, and more like the works of a mighty and powerful people than of so small a state. The mortars cut out of the rock are a tremendous invention. There are about fifty of them near the different creeks and landing-places round the island. They are directed at the most probable spots where boats would attempt a landing. The mouths of some of these mortars are about six feet wide, and they are said to throw a hundred cantars of cannon-balls or stones. A cantar is, I think, about a hundred pounds' weight; so that if they do take effect, they must make a dreadful havoc amongst a debarkation of boats.

The distance of Malta from Gozo is not above four or five miles, and the small island of Commino lies betwixt them. The coasts of all the three are bare and barren, but covered over with towers, redoubts, and fortifications of various kinds.

As Gozo is supposed to be the celebrated island of Calypso, you may believe we expected something very fine; but we were disappointed. It must either be greatly fallen off since the time she inhabited it, or the Archbishop of Cambray, as well as Homer, must have flattered greatly in their painting. We looked as we went along the coast for the grotto of the goddess, but could see nothing that resembled it. Neither could we observe those verdant banks eternally covered with flowers, nor those lofty trees for ever in blossom, that lost their heads in the clouds, and afforded a

shade to the sacred baths of her and her nymphs. We saw, indeed, some nymphs; but as neither Calypso nor Eucharis seemed to be of the number, we paid little attention to them, and I was in no apprehension about my Telemachus; indeed, it would have required an imagination as strong as Don Quixote's to have brought about the metamorphosis.

Finding our hopes frustrated, we ordered our sailors to pull out to sea, and bade adieu to the island of Calypso, concluding either that our intelligence was false, or that both the island and its inhabitants were greatly changed. We soon found ourselves once more at the mercy of the waves; night came on, and our rowers began their evening song to the Virgin, and beat time with their oars. Their offering was acceptable, for we had the most delightful weather. We wrapt ourselves up in our cloaks, and slept most comfortably, having provided mattresses at Malta. By a little after daybreak we found we had got without sight of all the islands, and saw only part of Mount *Ætna* smoking above the waters. The wind sprung up fair, and by ten o'clock we had sight of the coast of Sicily.

On considering the smallness of our boat, and the great breadth of this passage, we could not help admiring the temerity of these people, who, at all seasons of the year, venture to Sicily in these diminutive vessels; yet it is very seldom that any accident happens, they are so perfectly acquainted with the weather, foretelling, almost to a certainty, every storm many hours before it comes on. The sailors look upon this passage as one of the most stormy and dangerous in the Mediterranean. It is called the canal of Malta, and is much dreaded by the Levant ships; but, indeed, at this season there is no danger.

We arrived at Sicily a little before sunset, and landed opposite to Ragusa, and not far from the ruins of the Little Hybla—the third town of that name in the island, distinguished by the epithets of the Great (near Mount *Ætna*), the Lesser (near Augusta), and the Little (just by Ragusa). Here we found a fine sandy beach, and while the servants were employed in dressing supper, we amused ourselves with bathing and gathering shells, of which there is a considerable variety. We were in expectation of finding the nautilus, for which this island is famous, but in this we did not succeed. However, we picked up some handsome shells, though not equal to those that are brought from the Indies.

After supper we again launched our bark and went to sea. The wind was favourable as we could wish. We had our nightly serenade as usual, and the next day, by twelve o'clock, we reached the celebrated port of Agrigentum.

The captain of the port gave us a polite reception, and insisted on accompanying us to the city, which stands near the top of a mountain, four miles distant from the harbour, and about eleven hundred feet above the level of the sea. The road on each side is bordered by a row of exceeding large American aloes, upwards of one-third of them being at present in full blow, and making the most beautiful appearance that can be imagined. The flower-stems of this noble plant are in general betwixt twenty and thirty feet high (some of them more), and are covered with flowers from top to bottom, which taper regularly, and form a beautiful kind of pyramid, the base or pedestal of which is the fine spreading leaves of the plant. As this is esteemed in northern countries one of the greatest curiosities of the vegetable tribe, we were happy at seeing it in so great perfection—much greater, I think, than I had ever seen it before.

With us, I think, it is vulgarly reckoned (though I believe falsely), that they only flower once in a hundred years. Here I was informed, that, at the latest, they always blow the sixth year, but for the most part the fifth.

As the whole substance of the plant is carried into

the stem and the flowers, the leaves begin to decay as soon as the blow is completed, and a numerous offspring of young plants are produced round the root of the old one: these are slipped off and formed into new plantations, either for hedges or for avenues to their country houses.

The city of Agrigentum, now called Girgenti, is irregular and ugly, though from a few miles distance at sea it makes a noble appearance, little inferior to that of Genoa. As it lies on the slope of the mountain, the houses do not hide one another, but every part of the city is seen.

On our arrival we found a great falling off indeed; the houses are mean, the streets dirty, crooked, and narrow. It still contains near twenty thousand people; a sad reduction from its ancient grandeur, when it was said to consist of no less than eight hundred thousand,\* being the next city to Syracuse for numbers.

The Canonico Spoto, from Mr Hamilton's letter, and from our former acquaintance with him at Naples, gave us a kind and hospitable reception. He insisted on our being his guests; and we are now in his house, comfortably lodged and elegantly entertained, which, after our crowded little apartment in the sponararo, is by no means a disagreeable change. Farewell. I shall write you again soon. Ever yours.

#### REMAINS OF AGRIGENTUM.

*Agrigentum, June 12.*

WE are just now returned from examining the antiquities of Agrigentum, the most considerable, perhaps, of any in Sicily.

The ruins of the ancient city lie about a short mile from the modern one. These, like the ruins of Syracuse, are mostly converted into corn fields, vineyards, and orchards; but the remains of the temples here are much more conspicuous than those of Syracuse. Four of these have stood pretty much in a right line, near the south wall of the city. The first they call the temple of Venus, almost one-half of which still remains. The second is that of Concord: it may be considered as entire, not one column having as yet fallen. It is precisely of the same dimensions and same architecture as that of Venus, which had probably served as the model for it. By the following inscription, found on a large piece of marble, it appears to have been built at the expense of the Lilibitani, probably after having been defeated by the people of Agrigentum:—

CONCORDIÆ AGRIGENTINORUM SACRUM,  
REPUBLICA LILIBITANORUM,  
DEDICANTIBUS M. ATTERIO CANDIDO PROCOS.  
ET L. CORNELIO MARCELLO.  
Q. P. R. P. R. †

These temples are supported by thirteen large fluted Doric columns on each side, and six at each end. All their bases, capitals, entablatures, &c., still remain entire; and as the architecture is perfectly simple, without any thing affected or studied, the whole strikes the eye at once, and pleases very much. The columns are, indeed, shorter than the common Doric proportions, and they certainly are not so elegant as some of the ancient temples near Rome and in other places in Italy.

The third temple is that of Hercules, altogether in ruins, but appears to have been of a much greater size than the former two. We measured some of the broken columns, near seven feet in diameter. It was here that the famous statue of Hercules stood, so much celebrated by Cicero, which the people of Agrigentum

\* [We are at a loss to understand how Mr Brydone should have fallen into this mistake. Diodorus says that the city, in its best days, contained 120,000 persons.]

† [The republic of the Lilibitani consecrate this edifice to the concord of the Agrigentines, the dedicators being M. Atterius Candidus the proconsul, and L. Cornelius Marcellus.]

defended with such bravery against Verres, who attempted to seize it. You will find the whole story in his pleadings against that infamous prætor.

There was likewise in this temple a famous picture by Zeuxis. Hercules was represented in his cradle killing the two serpents; Alcmena and Amphitruon having just entered the apartment, were painted with every mark of terror and astonishment. Pliny says the painter looked upon this piece as invaluable, and therefore could never be prevailed on to put a price upon it, but gave it as a present to Agrigentum, to be placed in the temple of Hercules. These two great masterpieces have been lost. We thought of them with regret whilst we trod on these venerable ruins.

Near to this lie the ruins of the temple of Jupiter Olympus, supposed by the Sicilian authors to have been the largest in the heathen world. It is now called *Il Tempio de Giganti*, or the Giant's Temple, as the people cannot conceive that such masses of rock could ever be put together by the hands of ordinary men. The fragments of columns are indeed enormous, and give us a vast idea of this fabric. It is said to have stood till the year 1100, but is now a perfect ruin. Our Cicerones assured us it was exactly the same dimensions with the church of St Peter at Rome; but in this they are egregiously mistaken, St Peter's being much greater than any thing that ever the heathen world produced.

There are the remains of many more temples, and other great works, but these, I think, are the most conspicuous. They show you that of Vulcan, of Proserpine, of Castor and Pollux, and a very remarkable one of Juno. This, too, was enriched by one of the most famous pictures of antiquity, which is celebrated by many of the ancient writers. Zeuxis was determined to excel every thing that had gone before him, and to form a model of human perfection. To this end he prevailed on all the finest women of Agrigentum, who were even ambitious of the honour, to appear naked before him. Of these he chose five for his models, and moulding all the perfections of these beauties into one, he composed the picture of the goddess. This was ever looked upon as his masterpiece, but was unfortunately burnt when the Carthaginians took Agrigentum. Many of the citizens retired into this temple as to a place of safety, but as soon as they found the gates attacked by the enemy, they agreed to set fire to it, and chose rather to perish in the flames than submit to the power of the conquerors. However, neither the destruction of the temple, nor the loss of their lives, has been so much regretted by posterity as the loss of this picture.

The temple of Æsculapius, the ruins of which are still to be seen, was not less celebrated for a statue of Apollo. It was taken from them by the Carthaginians at the same time that the temple of Juno was burnt. It was carried off by the conquerors, and continued the greatest ornament of Carthage for many years, and was at last restored by Scipio at the final destruction of that city. Some of the Sicilians allege, I believe without any ground, that it was afterwards carried to Rome, and still remains there, the wonder of all ages, known to the whole world under the name of the Apollo of Belvidere, and allowed to be the perfection of human art.

I should be very tedious were I to give you a minute description of every piece of antiquity. Indeed, little or nothing is to be learned from the greater part of them. The ancient walls of the city are mostly cut out of the rock; the catacombs and sepulchres are all very great; one of these is worthy of particular notice, because it is mentioned by Polybius as being opposite to the temple of Hercules, and to have been struck by lightning even in his time. It remains almost entire, and answers the description he gives of it; the inscriptions are so defaced that we could make nothing of them.

This is the monument of Tero, King of Agrigentum,

one of the first of the Sicilian tyrants. The great antiquity of it may be gathered from this, that Tero is not only mentioned by Diodorus, Polybius, and the later of the ancient historians, but likewise by Herodotus and Pindar, who dedicates two of his Olympic Odes to him; so that this monument must be more than two thousand years old. It is a kind of pyramid, probably one of the most durable forms.

All these mighty ruins of Agrigentum, and the whole mountain on which it stands, are composed of a concretion of sea-shells run together, and cemented by a kind of sand or gravel, and now become as hard, and perhaps more durable than even marble itself. This stone is white before it has been exposed to the air, but in the temples and other ruins, it is become of a dark brown. I shall bring home some pieces of it for the inspection of the curious. I found these shells on the very summit of the mountain, at least fourteen or fifteen hundred feet above the level of the sea. They are of the commonest kinds, cockles, mussels, oysters, &c.

The things, we know, are neither rich nor rare;  
But wonder how the devil they got there.

By what means they have been lifted up to this vast height, and so intimately mixed with the substance of the rock, I leave to you and your philosophical friends to determine. This old battered globe of ours has probably suffered many convulsions not recorded in any history. You have heard of the vast stratum of bones lately discovered in Istria and Ossero; part of it runs below rocks of marble, upwards of forty feet in thickness, and they have not yet been able to ascertain its extent; something of the same kind has been found in Dalmatia, in the islands of the Archipelago, and lately, I am told, in the rock of Gibraltar. Now, the Deluge recorded in scripture will hardly account for all the appearances of this sort to be met with, almost in every country in the world. But I am interrupted by visitors, which is a lucky circumstance both for you and me, for I was just going to be very philosophical, and consequently very dull.\* Adieu.

#### ANCIENT GREATNESS OF AGRIGENTUM.

*Agrigentum, June 13.*

THE interruption in my last was a deputation from the bishop, to invite us to a great dinner to-morrow at the port, so that we shall know whether this place still deserves the character of luxury it always held among the ancients: we have great reason to think, from the politeness and attention we have met with, that it has never lost its ancient hospitality, for which it was likewise so much celebrated.

Plato, when he visited Sicily, was so much struck with the luxury of Agrigentum, both in their houses and their tables, that a saying of his is still recorded, that they built as if they were never to die, and ate as if they had not an hour to live. It is preserved by Ælian, and is just now before me.

He tells a story by way of illustration, which shows a much greater conformity of manners than one could have expected, betwixt the young nobility among the ancients and our own at this day. He says, that after a great feast, where there was a number of young people of the first fashion, they got all so much intoxicated, that from their reeling and tumbling upon one another, they imagined they were at sea in a storm, and began to think themselves in

\* [The interruption cannot be considered as any great misfortune, as the state of knowledge on the subject in question in the days of Mr Brydone was not such as to have enabled him to pursue the speculation with any profit to a modern reader. Modern geology has shown that the formation of rocks of the kind described, and their elevation above the level of the sea, were events long antecedent to the Deluge of scripture, and entirely independent of it.]

the most imminent danger; at last they agreed, that the only way to save their lives was to lighten the ship, and with one accord began to throw the rich furniture out of the windows, to the great edification of the mob below, and did not stop till they had entirely cleared the house of it, which, from this exploit, was ever after denominated the *triremes*, or the ship. He says it was one of the principal palaces of the city, and retained this name for ever after. In Dublin, I have been told, there are more than one *triremes*; and that this frolic, which they call throwing the house out of the window, is by no means uncommon.

At the same time that Agrigentum is abused by the ancient authors for its drunkenness, it is as much celebrated for its hospitality; and I believe it will be found, that this virtue and this vice have ever had a sort of sneaking kindness for each other, and have generally gone hand in hand, both in ancient and in modern times. The Swiss, the Scots, and the Irish, who are at present the most drunken people in Europe, are likewise, in all probability, the most hospitable; whereas, in the very sober countries, Spain, Portugal, and Italy, hospitality is a virtue very little known, or indeed any other virtue except sobriety, which has been produced probably a good deal from the tyranny of their governments, and their dread of the inquisition; for where every person is in fear lest his real sentiments should appear, it would be very dangerous to unlock his heart; but in countries where there are neither civil nor ecclesiastical tyrants to lay an embargo on our thoughts, people are under no apprehension lest they should be known.

However, these are not the only reasons. The moral virtues and vices may sometimes depend on natural causes. The very elevated situation of this city, where the air is exceedingly thin and cold, has perhaps been one reason why its inhabitants are fonder of wine than their neighbours in the valleys.

The same may be said of the three nations I have mentioned, the greater part of their countries lying amongst hills and mountains, where the climate renders strong liquors more necessary, or at least less pernicious, than in low places. It is not surprising that this practice, probably begun amongst the mountains, where the air is so keen, has by degrees crept down into the valleys, and has at last become almost epidemical in those countries.

Fazzello, after railing at Agrigentum for its drunkenness, adds, that there was no town in the island so celebrated for its hospitality. He says that many of the nobles had servants placed at the gates of the city, to invite all strangers to their houses. It is in reference to this probably, that Empedocles says, that even the gates of the city proclaimed a welcome to every stranger. From our experience we are well entitled to say, that the people of Agrigentum still retain this antiquated virtue, so little known in polite countries. To-morrow we shall have a better opportunity of judging whether it is still accompanied by its sister vice.

The accounts that the old authors give of the magnificence of Agrigentum are amazing, though, indeed, there are none of them that proclaim it in stronger terms than the monuments that still remain. Diodorus says, that the great vessels for holding water were commonly of silver, and the litters and carriages for the most part were of ivory richly adorned. He mentions a pond made at an immense expense, full of fish and of water-fowl, that in his time was the great resort of the inhabitants on their festivals; but he says, that even then (in the age of Augustus) it was going to ruin, requiring too great an expense to keep it up. There is not now the smallest vestige of it; but there is still to be seen a curious spring of water that throws up a kind of oil on its surface, which is made use of by the poor people in many diseases. This is supposed to mark out the place of the celebrated pond, which is recorded by Pliny and Solinus to have abounded with this oil.

Diodorus, speaking of the riches of Agrigentum, mentions one of its citizens returning victorious from the Olympic games, and entering his city attended by three hundred chariots, each drawn by four white horses richly caparisoned; and gives many other instances of their vast profusion and luxury.

Those horses, according to that author, were esteemed all over Greece for their beauty and swiftness, and their race is celebrated by many of the ancient writers.

Ardus inde Agragas ostentat maxima longo  
Mœnia, magnanimum quondam generator equorum,  
[Then Agragas, with lofty summits crown'd,  
Long for the race of warlike steeds renown'd.]

says Virgil in the third Æneid; and Pliny acquaints us, that those which had been often victorious at the games were not only honoured with burial rites, but had magnificent monuments erected to eternise their memory. This Timæus confirms: he tells us, that he saw at Agrigentum several pyramids built as sepulchral monuments to celebrated horses: he adds, that when those animals became old and unfit for service, they were always taken care of, and spent the remainder of their lives in ease and plenty. I could wish that our countrymen would imitate the gratitude and humanity of the Sicilians in this article, at least the latter part of it. I don't know that our nation can so justly be taxed with cruelty or ingratitude in any other article as in their treatment of horses, the animal that of all others is the most entitled to our care. How piteous a thing it is, on many of your great roads, to see the finest old hunters, that were once the glory of the chase, condemned, in the decline of life, to the tyranny of the most cruel oppressors, in whose hands they suffer the most extreme misery, till they at last sink under the task that is assigned them. I am called away to see some more antiques, but shall finish this letter to-night, as the post goes off for Italy to-morrow morning.

13th, afternoon.—We have seen a great many old walls and vaults that little or nothing can be made of. They give them names, and pretend to tell you what they were, but as they bear no resemblance to those things now, it would be no less idle to trouble you with their nonsense than to believe it. We have indeed seen one thing that has amply repaid us for the trouble we have taken. It is the representation of a boar-hunt, in *alto relievo*, on white marble; and is at least equal, if not superior, to any thing of the kind I have met with in Italy. It consists of four different parts, which form the history of this remarkable chase and its consequences.

The first is the preparation for the hunt. There are twelve hunters, with each his lance, and a short hanger under his left arm of a very singular form. The dogs resemble those we call lurchers. The horses are done with great fire and spirit, and are perhaps a better proof of the excellence of the race, than even the testimony of their authors; for the artist that formed these must certainly have been accustomed to see very fine horses.

The second piece represents the chase; the third the death of the king, by a fall from his horse; and the fourth the despair of the queen and her attendants on receiving the news. She is represented as falling down in a swoon, and supported by her women, who are all in tears.

It is executed in the most masterly style, and is indeed one of the finest remains of antiquity. It is preserved in the great church, which is noted through all Sicily for a remarkable echo—something in the manner of our whispering gallery at St. Paul's, though more difficult to be accounted for. If one person stands at the west gate, and another places himself on the cornice, at the most distant point of the church, exactly behind the great altar, they can hold a conversation in very low whispers.

For many years this singularity was little known; and several of the confessing chairs being placed near the great altar, the wags who were in the secret used to take their station at the door of the cathedral, and by this means heard distinctly every word that passed betwixt the confessor and his penitent; of which, you may believe, they did not fail to make their own use when occasion offered. The most secret intrigues were discovered, and every woman in Agrigentum changed either her gallant or her confessor. Yet still it was the same. At last, however, the cause was found out, the chairs were removed, and other precautions were taken, to prevent the discovery of these sacred mysteries, and a mutual amnesty passed amongst all the offended parties.

Agrigentum, like Syracuse, was long subject to the yoke of tyrants. Fazzello gives some account of their cruelty, but I have no intention of repeating it; one story, however, pleased me; it is a well-known one, but as it is short you shall have it.

Perillo, a goldsmith, by way of paying court to Phalaris the tyrant, made him a present of a brazen bull, of admirable workmanship, hollow within, and so contrived that the voice of a person shut up in it sounded exactly like the bellowing of a real bull. The artist pointed out to the tyrant what an admirable effect this must produce, were he only to shut up a few criminals in it and make a fire under them.

Phalaris, struck with so horrid an idea, and perhaps curious to try the experiment, told the goldsmith that he himself was the only person worthy of animating his bull; that he must have studied the note that made it roar to the greatest advantage, and that it would be unjust to deprive him of any part of the honour of his invention. Upon which he ordered the goldsmith to be shut up, and made a great fire around the bull, which immediately began to roar, to the admiration and delight of all Agrigentum. Cicero says, this bull was carried to Carthage at the taking of Agrigentum, and was restored again by Scipio after the destruction of that city.

Fazzello adds another story, which is still more to the honour of Phalaris. Two friends, Melanippus and Cariton, had conspired his death. Cariton, in hopes of saving his friend from the danger of the enterprise, determined to execute it alone. However, in his attempt to poniard the tyrant, he was seized by the guards, and immediately put to the torture to make him confess his accomplice: this he bore with the utmost fortitude, refusing to make the discovery; till Melanippus, informed of the situation of his friend, ran to the tyrant, assuring him that he alone was the guilty person, that it was entirely by his instigation that Cariton had acted; and begged that he might be put on the rack in the place of his friend. Phalaris, struck with such heroism, pardoned them both.

Notwithstanding this generous action, he was in many respects a barbarous tyrant. Fazzello gives the following account of his death, with which I shall conclude this letter, for I am monstrosly tired, and I dare say so are you. Zeno, the philosopher, came to Agrigentum, and being admitted into the presence of the tyrant, advised him, for his own comfort as well as that of his subjects, to resign his power and to lead a private life. Phalaris did not relish these philosophical sentiments, and, suspecting Zeno to be in a conspiracy with some of his subjects, ordered him to be put to the torture in presence of the citizens of Agrigentum.

Zeno immediately began to reproach them with cowardice and pusillanimity in submitting tamely to the yoke of so worthless a tyrant, and in a short time raised such a flame, that they defeated the guards and stoned Phalaris to death. I dare say you are glad they did it so quickly. Well, I shall not write such long letters for the future: for, I assure you, it is at least as troublesome to the writer as the reader. Adieu. We shall sail to-morrow or next morning for Trapani,

from whence you may expect to hear from me. We are now going out to examine more antique walls, but I shall not trouble you with them. Farewell.

~~~~~

SICILIAN EPICURES.—JOURNEY TO PALERMO.—  
SPANISH TYRANNY.

June 16.

WHEN I have nothing else to do, I generally take up the pen. We are now on the top of a high mountain, about half way betwixt Agrigentum and Palermo. Our sea expedition by Trapani has failed, and we are determined to put no more confidence in that element, happy beyond measure to find ourselves at a distance from it, though in the most wretched of villages. We have travelled all night on mules, and arrived here about ten o'clock, overcome with sleep and fatigue. We have just had an excellent dish of tea, which never fails to cure me of both, and I am now as fresh as when we set out. It has not had the same effect on my companions; they have thrown themselves down on a vile straw bed in the corner of the hovel, and in spite of a parcel of starved chickens, that are fluttering about and picking the straws all round them, they are already fast asleep.

I shall seize that time to recapitulate what has happened since my last.

The day after I wrote you, we made some little excursions round Agrigentum. The country is delightful, producing corn, wine, and oil, in the greatest abundance; the fields are at the same time covered with a variety of the finest fruits, oranges, lemons, pomegranates, almonds, pistachio-nuts, &c. These afforded us almost as agreeable an entertainment as the consideration of the ruins from whence they spring.

We dined with the bishop, according to agreement, and rose from table convinced that the ancient Agrigentini could not possibly understand the true luxury of eating better than their descendants, to whom they have transmitted a very competent portion both of their social virtues and vices. I beg their pardon for calling them vices, I wish I had a softer name for it; it looks like ingratitude for their hospitality, for which we owe them so much.

We were just thirty at table, but, upon my word, I do not think we had less than a hundred dishes of meat. These were dressed with the richest and most delicate sauces, and convinced us that the old Roman proverb of "*Siculus coquus, et Sicula mensa*" [a Sicilian cook, and a Sicilian table] was not more applicable in their time than it is at present. Nothing was wanting that could be invented to stimulate and to flatter the palate, and to create a false appetite as well as to satisfy it. Some of the very dishes so much relished by the Roman epicures made a part of the feast, particularly the *morene*, which is so often mentioned by their authors. It is a species of eel, found only in this part of the Mediterranean, and sent from hence to several of the courts of Europe. It is not so fat and luscious as other eels, so that you can eat a good deal more of it; its flesh is as white as snow, and is indeed a very great delicacy. But a modern refinement in luxury has, I think, still produced a greater: by a particular kind of management they make the livers of their fowls grow to a large size, and at the same time acquire a high and rich flavour. It is indeed a most incomparable dish; but the means of procuring it is so cruel, that I will not even trust it with you. Perhaps, without any bad intention, you might mention it to some of your friends, they to others, till at last it might come into the hands of those that would be glad to try the experiment, and the whole race of poultry might ever have reason to curse me; let it suffice to say, that it occasions a painful and lingering death to the poor animal: that I

know is enough to make you wish never to taste of it, whatever effect it may have upon others.

The Sicilians ate of every thing, and attempted to make us do the same. The company was remarkably merry, and did by no means belie their ancient character, for most of them were more than half-seas over long before we rose from table; and I was somewhat apprehensive of a second edition of the triceus scene, as they were beginning to reel exceedingly. By the bye, I do not doubt but that phrase of *half-seas over* may have taken its origin from some such story. They begged us to make a bowl of punch, a liquor they had often heard of, but had never seen. The materials were immediately found, and we succeeded so well, that they preferred it to all the wines on the table, of which they had a great variety. We were obliged to replenish the bowl so often, that I really expected to see most of them under the table. They called it *Pontio*, and spoke loudly in its praise, declaring that *Pontio* (alluding to Pontius Pilate) was a much better fellow than they had ever taken him for. However, after dinner, one of them, a reverend canon, grew excessively sick, and while he was throwing up, he turned to me with a rueful countenance, and shaking his head, he groaned out, "*Ah, signor capitano, sapeva sempre che Pontio era un grande traditore*"—[I always knew that Pontius was a great traitor.] Another of them, overhearing him, exclaimed, "*Aspettatevi, signor canonico. Niente al pregiudizio di Signor Pontio, vi prego. Ricordate, che Pontio v'ha fatto un canonico, et Pontio ha fatto sua eccellenza uno vescovo. Non scordatevi mai di vostri amici?*"—[Not so fast, my good canon. Nothing to the prejudice of Signor Pontius, if you please. Remember, Pontius made you a canon, and Pontius also made his excellency a bishop. Never forget your friends.]

Now, what do you think of these reverend fathers of the church?—their merit, you will easily perceive, does not consist in fasting and prayer. Their creed, they say, they have a good deal modernised, and it is much simpler than that of Athanasius. One of them told me, that if we would but stay with them for some little time, we should soon be convinced that they were the happiest fellows on earth. "We have exploded," said he, "from our system every thing that is dismal or melancholy, and are persuaded that, of all the roads in the universe, the road to heaven must be the pleasantest and least gloomy; if it be not so," added he, "God have mercy upon us, for I am afraid we shall never get there." I told him I could not flatter him—"that if laughing was really a sin, as some people taught, they were certainly the greatest of all sinners." "Well," said he, "we shall at least endeavour to be happy here, and that, I am persuaded, is the best of all preparations for happiness hereafter. Abstinence from all innocent and lawful pleasures we reckon one of the greatest sins, and guard against it with the utmost care; and I am pretty sure it is a sin that none of us here will ever be damned for." He concluded by repeating two lines, which he told me was their favourite maxim, the meaning of which was exactly the same as those of Mr Pope—

For God is paid when man receives;  
To enjoy is to obey.

This is not the first time I have met with this libertine spirit amongst the Roman Catholic clergy. There is so much nonsense and mummery in their worship, that they are afraid lest strangers should believe they are serious, and perhaps too often fly to the opposite extreme.

We were, however, much pleased with the bishop; he is greatly and deservedly respected, yet his presence did nowise diminish, but rather increased the jollity of the company. He entered into every joke, joined in the repartee, at which he is a great proficient, and entirely laid aside his episcopal dignity, which, however, I am told, he knows very well how

to assume when it is necessary. He placed us next to himself, and behaved, indeed, in every respect with the greatest ease and politeness. He belongs to one of the first families of the island, and is brother to the Prince of ——. I had his whole pedigree pat, but now I have lost it; no matter, he is an honest, pleasant little fellow; and that is of much more consequence. He is not yet forty; and so high a promotion, in so early a period of life, is reckoned very extraordinary, this being the richest bishopric in the kingdom. He is a good scholar, and very deeply read, both in ancient and modern learning, and his genius is in no degree inferior to his erudition. The similarity of character and circumstances struck me so strongly, that I could scarce help thinking I had got beside our worthy and respectable friend the Bishop of D——y,\* which, I assure you, still added greatly to the pleasure I had in his company. I told the bishop of this, adding, that he was brother to Lord B——I; he seemed much pleased, and said, he had often heard of the family, both when Lord B——I was ambassador in Spain, and his other brother commander in the Mediterranean.†

We found in this company a number of freemasons, who were delighted beyond measure when they discovered that we were their brethren. They pressed us to spend a few more days amongst them, and offered us letters to Palermo, and every other town we should think of visiting; but the heats are increasing so violently, that we were afraid of prolonging our expedition, lest we should be caught by the sirocco winds, supposed to blow from the burning deserts of Africa, and sometimes attended with dangerous consequences to those that travel over Sicily.

But I find I have omitted several circumstances of our dinner. I should have told you, that it was an annual feast given by the nobility of Agrigentum to the bishop. It was served in an immense granary, half full of wheat, on the sea-shore, chosen on purpose to avoid the heat. The whole was on plate; and what appeared singular to us, but I believe is a much better method than ours, great part of the fruit was served up with the second course, the first dish of which that went round was strawberries. The Sicilians were a good deal surprised to see us eat them with cream and sugar, yet upon trial they did not at all dislike the composition.

The dessert consisted of a great variety of fruits, and a still greater of ices; these were so disguised in the shape of peaches, figs, oranges, nuts, &c., that a person unaccustomed to ices might very easily have been taken in, as an honest sea-officer was lately at the house of a certain minister of your acquaintance, not less distinguished for the elegance of his table than the exact formality and subordination to be observed at it. After the second course was removed, and the ices, in the shape of various fruits and sweetmeats, advanced by way of rearguard, one of the servants carried the figure of a fine large peach to the captain, who, unacquainted with deceit of any kind, never doubted that it was a real one, and cutting it through the middle, in a moment had one large half of it in his mouth. At first he only looked grave, and blew up his cheeks to give it more room; but the violence of the cold soon getting the better of his patience, he began to tumble it about from side to side in his mouth, his eyes rushing out of water, till

\* [Lord Frederick Hervey, Bishop of Derry from 1768 to 1803. He succeeded his brother as Earl of Bristol in 1779.]

† [George William, second Earl of Bristol, was ambassador at the Spanish court when the famous family compact was entered into between the French and Spanish monarchs, on which event he left Madrid without taking leave, and war was proclaimed against Spain a month afterwards. Dying in 1775, he was succeeded by his next brother, Augustus John, the naval officer alluded to in the text; on whose death in 1779, the Bishop of Derry inherited the title. All these three noblemen were sons of the gay and witty Lord Hervey, celebrated in the verse of Pope and the prose of Walpole.]

at last, able to hold no longer, he spit it out upon his plate, exclaiming with a horrid oath, "As I live, a painted snowball!" and wiping away his tears with his napkin, he turned in a rage to the Italian servant that had helped him, with a "Confound you, you macaroni rascal, what did you mean by that?" The fellow, who did not understand a word, could not forbear smiling, which still farther convinced the captain that it was a trick; and he was just going to throw the rest of the snowball in his face, but was prevented by one of the company; when recovering from his passion, and thinking the object unworthy of it, he only added in a softer tone, "Very well, neighbour, I only wish I had you on board ship for half an hour—you should have a dozen before you could say Jack Robinson, for all your painted cheeks."

I ask pardon for this digression, but as it is a good laughable story, I know you will excuse it. About six o'clock, we took a cordial leave of our jolly friends at Agrigentum, and embarked on board our sponararo at the new port. I should have told you, that this harbour has lately been made at a very great expense, this city having always been one of the principal ports of the island for the exportation of grain. The bishop and his company went into a large barge, and sailed round the harbour; we saluted them as we went out, they returned the compliment, and we took a second leave. The evening was fine, and we coasted along for a good many miles; we passed several points and little promontories, that were exceedingly beautiful and picturesque; many of them were covered with noble large aloes in full blow. In one place, I counted upwards of two hundred of those fine majestic plants all in flower—a sight which I imagined was hardly to be met with in the world. After sunset—alas! fain would I conceal what happened after sunset—but life, you know, is chequered with good and evil, and it would have been great presumption to receive so much of the one, without expecting a little dash of the other too. Besides, a sea expedition is nothing without a storm. Our journal would never have been readable had it not been for this. Well, I assure you, we had it. It was not indeed so violent as the great one off Louisburg, or perhaps even that described by Virgil, the reading of which is said to have made people sea-sick, but it was rather too much for our little bark. I was going to tell you, that after sunset the sky began to overcast, and in a short time the whole atmosphere appeared fiery and threatening. We attempted to get into some creek, but could find none. The wind grew loud, and we found it was in vain to proceed; but as the night was dark and hazy, we were dubious about the possibility of reaching the port of Agrigentum. However, this was all we had for it, as there were none other within many miles. Accordingly, we tacked about, and plying both oars and sail, with great care not to come amongst the rocks and breakers, in about two hours we spied the lighthouse, by which we directed our course, and got safely into port betwixt one and two in the morning: we lay down on our mattress, and slept sound till ten, when finding the falsity of our hypothesis, that there could be no bad weather in the Mediterranean at this season, we unanimously agreed to have nothing more to do with sponararos, and sent immediately to engage mules to carry us over the mountains to Palermo. The storm continued with violence the whole day, and made us often thank Heaven we had got safely back. It was not till five in the afternoon that we had mules, guides, and guards provided us, when we set off pretty much in the same order, and with the same equipage, as we had done about three weeks ago from Messina. Our guards attempted to fill us with the most dreadful apprehensions of this road, showing us every mile where such a one was robbed, such another was murdered, and entertained us with such melancholy ditties the greater part of the way. Indeed, if one-half of their stories be true, it is certainly the most dangerous

road in the world; but I looked upon most of them as fictions, invented only to increase their own consequence and to procure a little more money. There is, indeed, some foundation for these stories, as there are numbers of gibbets erected on the road *in terrorem*; and every little baron has the power of life and death in his own domain. Our bishop's brother, whose name I have forgot, seized lately four-and-twenty of those desperate banditti, after a stout resistance, where several were killed on both sides; and notwithstanding that some of them were under the protection of the nobility, and in their service, they were all hanged. However, this has by no means rooted them out. Our guards, in the suspicious places, went with their pieces cocked, and kept a close lookout to either side of them; but we saw nothing to alarm us, except the most dreadful roads in the world, in many places worse than any thing I ever met with amongst the Alps.

After travelling about twenty miles, we arrived by two in the morning at the most wretched—I don't know what to call it—there was not any one thing to be had but a little straw for the mules. However, after a good deal of difficulty, we at last got fire enough to boil our tea-kettle, and having brought bread from Agrigentum, we made an excellent meal. Our tea-table was a round stone in the field, and as the moon shone bright, we had no occasion for any other luminary. You may believe our stay here was as short as possible; the house was too dreadfully nasty to enter it, and the stable was full of poor wretches sleeping on the bare ground. In short, I never saw in any country so miserable an inn, for so it is styled. We mounted our cavalry with all expedition, and in a very short time got into the woods, where we were serenaded by the nightingale as we went along, who made us a full apology and atonement for the bad cheer we had met with. In a short time it was day, and then we had entertainment enough from the varied scenes of the most beautiful, wild, and romantic country in the world. The fertility of many of the plains is truly astonishing, without enclosures, without manure, and almost without culture. It is with reason that this island was styled, "*Romani imperii horreum*"—(the granary of the Roman empire). Were it cultivated, it would still be the great granary of Europe. Pliny says it yielded a hundred after one; and Diodorus, who was a native of the island and wrote on the spot, assures us that it produced wheat and other grain spontaneously; and Homer advances the same fact in the *Odyssey*:

The soil untill'd, a ready harvest yields,  
With wheat and barley wave the golden fields;  
Spontaneous wines from weighty clusters pour,  
And Jove descends in each prolific shower.

Many of the mountains seemed to be formed by subterraneous fire; several of them retain their conical figure and their craters, but not so exact as those on Mount *Ætna*, as they are probably much older. I likewise observed many pieces of lava on the road and in the beds of the torrents, and a good deal of the stone called *tufa*, which is certainly the production of a volcano;\* so that I have no doubt that a great part of this island, as well as the neighbouring ones of Lipari, &c., has been originally formed by subterraneous fire: we likewise passed some quarries of a kind of talc, and also of a coarse alabaster; of this they make a sort of stucco or plaster, resembling that of Paris; but, what I much regretted, we missed seeing the famous salt of Agrigentum, found in the earth about four or five miles from that city. It has this remarkable property, different from all other salt, that in the fire it presently melts; but in the water it cracks

\* [Mr Brydone perhaps means *tuff*, a kind of rock formed of scorie, sand, and ashes, washed down into a hollow, and there agglutinated. *Tufa* is a rock formed by the deposition of lime from water.]

and splits, but never dissolves. It is celebrated by Pliny, Aristotle, and others of the ancient as well as modern naturalists. Fazzello, whom I have brought along with me to read by the road, says he has often experienced this: he adds, from the authority of these ancient authors, that they formerly had mines of this salt so pure and solid, that the statuaries and sculptors preferred it to marble, and made various works of it.

The poor people of the village have found us out, and with looks full of misery have surrounded our door. Accursed tyranny, what despicable objects we become in thy hands! Is it not inconceivable how any government should be able to render poor and wretched a country which produces almost spontaneously every thing that even luxury can desire? But, alas! poverty and wretchedness have ever attended the Spanish yoke, both on this and on the other side of the globe. They make it their boast that the sun never sets on their dominions, but forget that since they became such, they have left him nothing to see in his course but deserted fields, barren wildernesses, oppressed peasants, and lazy, lying, lecherous monks. Such are the fruits of their boasted conquests. They ought rather to be ashamed that ever the sun should see them at all. The sight of these poor people has filled me with indignation. This village is surrounded by the finest country in the world, yet there was neither bread nor wine to be found in it, and the poor inhabitants appear more than half starved.

'Mongst Ceres' richest gifts with want oppress'd,  
And 'midst the flowing vineyard, die of thirst.

I shall now think of concluding, as I do not recollect that I have much more to say to you: besides, I find myself exceedingly sleepy. I sincerely wish it may not be the same case with you before you have read thus far. We have ordered our mules to be ready by five o'clock, and shall again travel all night—the heats are too great to allow of it by day. Adieu. These two fellows are still sound asleep. In a few minutes, I shall be so too, for the pen is almost dropping out of my hand. Farewell.

#### PALERMO.—A FRENCH LANDLADY.

*Palermo, June 19.*

We are now arrived at the great capital of Sicily, which, in our opinion, in beauty and elegance is greatly superior to Naples. It is not, indeed, so large; but the regularity, the uniformity, and neatness of its streets and buildings, render it much more pleasing; it is full of people, who have mostly an air of affluence and gaiety. And, indeed, we seem to have got into a new world. But stop—not so fast. I had forgot that you have still fifty miles to travel on a cursed stubborn mule, over rocks and precipices; for I can see no reason why we should bring you at once into all the sweets of Palermo, without bearing at least some little part in the fatigues of the journey. Come, we shall make them as short as possible.

We left you, I think, in a little village on the top of a high mountain. We should indeed use you very ill were we to leave you there any longer, for I own it is the very worst country quarters that ever fell to my lot. However, we got a good comfortable sleep in it, the only one thing it afforded us; and the fleas, the bugs, and chickens, did all that lay in their power even to deprive us of that, but we defied them. Our two leaders came to awake us before five, apostrophising their entry with a detail of the horrid robberies and murders that had been committed in the neighbourhood, all of them, you may be sure, on the very road that we were to go.

Our whole squadron was drawn out, and we were ranged in order of battle by five o'clock, when we began our march, attended by the whole village, man,

woman, and child. We soon got down amongst the woods, and endeavoured to forget the objects of misery we had left behind us. The beauty and richness of the country increased in proportion as we advanced. The mountains, although of a great height (that we have left is near four thousand feet, the mercury standing at 26 inches 2 lines), are covered to the very summit with the richest pasture. The grass in the valleys is already burnt up, so that the flocks are all upon the mountains. The gradual separation of heat and cold is very visible in taking a view of them. The valleys are brown and scorched, and so are the mountains to a considerable height; they then begin to take a shade of green, which grows deeper and deeper, and covers the whole upper region: however, on the summit, the grass and corn are by no means so luxuriant as about the middle. We were amazed at the richness of the crops, far superior to any thing I had ever seen either in England or Flanders, where the happy soil is assisted by all the arts of cultivation, whilst here the wretched husbandman can hardly afford to give it a furrow, and gathers in with a heavy heart the most luxuriant harvest. To what purpose is it given him? Only to lie a dead weight upon his hand, sometimes till it is entirely lost—exportation being prohibited to all such as cannot pay exorbitantly for it to the sovereign. What a contrast is there betwixt this and the little uncouth country of Switzerland! To be sure, the dreadful consequences of oppression can never be set in a more striking opposition to the blessings and charms of liberty. Switzerland, the very excrescence of Europe, where nature seems to have thrown out all her cold and stagnating humours—full of lakes, marshes, and woods, and surrounded by immense rocks and everlasting mountains of ice, the barren but sacred ramparts of liberty—Switzerland, enjoying every blessing, where every blessing seems to have been denied, whilst Sicily, covered by the most luxuriant productions of nature, where Heaven seems to have showered down its richest blessings with the utmost prodigality, groans under the most abject poverty, and, with a pale and wan visage, starves in the midst of plenty. It is Liberty alone that works this standing miracle. Under her plastic hands the mountains sink, the lakes are drained; and these rocks, these marshes, these woods, become so many sources of wealth and of pleasure. But what has temperance to do with wealth?

Here reigns Content  
And Nature's child, Simplicity; long since  
Exiled from polish'd realms.  
'Tis Industry supplies  
The little Temperance wants; and rosy Health  
Sits smiling at the board.

You will begin to think I am in danger of turning poetical in these classic fields: I am sure I neither suspected any of the mountains we have passed to be Parnassus, nor did I believe any one of the Nine foolish enough to inhabit them, except Melpomene perhaps, as she is so fond of tragical faces. However, I shall now get you out of them as soon as possible, and bring you once more into the gay world. I assure you I have often wished that you could have lent me your muse on this expedition; my letters would then have been more worth the reading: but you must take the will for the deed.

After travelling till about midnight, we arrived at another miserable village, where we slept for some hours on straw, and continued our journey again by daybreak. We had the pleasure of seeing the rising sun from the top of a pretty high mountain, and were delighted with the prospect of Strombolo, and the other Lipari islands, at a great distance from us. On our descent from this mountain, we found ourselves on the banks of the sea, and took that road, preferable to an inland one, although several miles nearer. We soon alighted from our mules, and plunged into the water, which has ever made one of our greatest pleasures in this expedition; nobody that has not tried it

can conceive the delight of this, after the fatigue of such a journey, and passing three days without undressing. Your friend Fullarton, though only seventeen, but whose mind and body now equally despise every fatigue, found himself strong as a lion, and fit to begin such another march. We boiled our tea-kettle under a fig-tree, and ate a breakfast that might have served a company of strolling players.

The approach to Palermo is fine. The alleys are planted with fruit-trees, and large American aloes in full blow. Near the city we passed a place of execution, where the quarters of a number of robbers were hung up upon hooks, like so many hams; some of them appeared newly executed, and made a very unsightly figure. On our arrival, we learned that a priest and three others had been taken a few days ago, after an obstinate defence, in which several were killed on both sides: the priest, rather than submit to his conquerors, plunged his hanger into his breast, and died on the spot; the rest submitted, and were executed.

As there is but one inn in Palermo, we were obliged to agree to their own terms (five ducats a-day). We are but indifferently lodged; however, it is the only inn we have yet seen in Sicily, and, indeed, may be said to be the only one in the island. It is kept by a noisy, troublesome Frenchwoman, who, I find, will plague us: there is no keeping her out of our rooms, and she never comes in without telling us of such a prince and such a duke, that were so superlatively happy at being lodged in her house; we can easily learn that they were all desperately in love with her; and, indeed, she seems to take it very much amiss that we are not inclined to be of the same sentiments. I have already been obliged to tell her that we are very retired sort of people, and do not like company; I find she does not esteem us the better for it; and this morning (as I passed through the kitchen without speaking to her) I overheard her exclaim, "*Ah, mon Dieu! comme ces Anglois sont sauvages*"—[Good Heaven! what savages these Englishmen are]. I believe we must take more notice of her, otherwise we shall certainly have our rent raised; but she is as fat as a pig and as ugly as the devil, and lays on a quantity of paint on each of her swelled cheeks, that looks like a great plaster of red morocco. Her picture is hanging in the room where I am now writing, as well as that of her husband, who, by the bye, is a ninny; they are no less vile curiosities than the originals. He is drawn with his snuff-box open in one hand, and a dish of coffee in the other; and at the same time does the amiable to the lady. I took notice of this triple occupation, which seemed to imply something particular. She told me that the thought was hers; that her husband was exceedingly fond of snuff and of coffee, and wanted by this to show that he was still more occupied with her than with either of them. I could not help applauding the ingenuity of the conceit. Madame is painted with an immense bouquet in her breast, and an orange in her right hand, emblematic of her sweetness and purity; and has the prettiest little smirk on her face you can imagine. She told me that she insisted on the painter drawing her "*avec le souris sur le visage*"—[with a smile upon the countenance]; but as he had not *esprit* [genius] enough to make her smile naturally, she was obliged to force one, "*qui n'étoit pas tout-à-fait si jolie que le naturel, mais qui vaudroit toujours mieux que de paraître sombre*"—[which was not quite so fine as the natural; but was nevertheless better than appearing gloomy]. I agreed with her perfectly, and assured her it became her very much; "*parceque les dames grasses sont toujours de bonne humeur*"—[because fat ladies are always good-humoured]. I found, however, that she would willingly have excused me the latter part of the compliment, which more than lost all that I had gained by the former. "*Il est vrai*" said she, a good deal piqued, "*j'ai un peu de l'embonpoint, mais pas tant grasse pourtant*"—[It is true that I am a little stout, but not

fat by any means]. I pretended to excuse myself, from not understanding all the fineness of the language; and assured her that *de l'embonpoint* was the very phrase I meant to make use of. She accepted the apology, and we are again reconciled; for, to give the devil his due, they are good-humoured. She made me a courtesy, and repeated, "*Oui, monsieur, pour parler comme il faut, il faut dire de l'embonpoint. On ne dit pas grasse*"—[Yes, sir, to speak properly, you ought to say *stout*. Nobody uses the word fat]. I assured her, bowing to the ground, that the word should for ever be erased from my vocabulary. She left me with a gracious smile, and a courtesy much lower than the first, adding, "*Je sçavois bien que monsieur étoit un homme comme il faut*"—[I knew that monsieur was quite a gentleman after all]; at the same time tripping off on her tiptoes, as light as a feather, to show me how much I had been mistaken. This woman made me recollect (what I have always observed) how little the manners of the French are to be changed by their connexion with other nations; allowing none to be in any degree worthy of imitation but their own. Although she has now been here these twenty years, she is still as perfectly French as if she had never been without the gates of Paris; and looks upon every woman in Palermo with the utmost contentment, because they have never seen that capital, nor heard the sublime music of its opera. She is likewise (allowing for the difference of rank) an admirable epitome of all Frenchwomen, whose universal passion has ever been the desire of admiration and of appearing young, and ever would be, I believe, were they to live to the age of a thousand. Any person that will take a look of the withered death's heads in their public places, covered over with a thick mask of paint, will be convinced of this. Now, our old ladies, when they get to the wrong side of sixty, generally take a jump up to the borders of fourscore, and appear no less vain of their years than ever they were of their youth. I know some of them, that I am sure are not less happy nor less contented, nor (I might almost add) less admired with their wrinkles than ever they were with their dimples. I do not know whether a cheerful old woman, who is willing to appear so, is more respectable or more estimable; or a withered witch, who fills up every wrinkle with varnish, and at fourscore attempts to give herself the bloom of four-and-twenty, is ridiculous and contemptible: but as dinner is on the table, I shall leave it to you to determine. Adieu.

---

#### THE MARINO.—CONVERSAZIONES.

Palermo, June 23.

I SHALL have a great deal to write you about this city; we are every day more delighted with it, and shall leave it with much regret. We have now delivered our letters, in consequence of which we are loaded with civilities, and have got into a very agreeable set of acquaintance. But I shall first attempt to give you some little idea of the town, and then speak of its inhabitants. It is by much the most regular I have seen, and is built upon that plan which I think all large cities ought to follow. The two great streets intersect each other in the centre of the city, where they form a handsome square, called the Ottangolo, adorned with elegant uniform buildings. From the centre of this square you see the whole of these noble streets and the four great gates of the city which terminate them, the symmetry and beauty of which produce a fine effect. The whole of these are to be magnificently illuminated some time next month, and must certainly be the finest sight in the world. The four gates are each at the distance of about half a mile (the diameter of the city being no more than a mile); these are elegant pieces of architecture richly adorned,

particularly the Porta Nova and Porta Felice, terminating the great street called the Corso, that runs south-west and north-east. The lesser streets in general run parallel to these great ones, so that from every part of the city, in a few minutes' walking, you are sure to arrive at one of the capital streets. The Porta Felice (by much the handsomest of these gates) opens to the Marino, a delightful walk, which constitutes one of the great pleasures of the nobility of Palermo. It is bounded on one side by the wall of the city, and on the other by the sea, from whence, even at this scorching season, there is always an agreeable breeze. In the centre of the Marino they have lately erected an elegant kind of temple, which during the summer months is made use of as an orchestra for music; and as in this season they are obliged to convert the night into day, the concert does not begin till the clock strikes midnight, which is the signal for the symphony to strike up; at that time the walk is crowded with carriages and people on foot; and the better to favour pleasure and intrigue, there is an order that no person, of whatever quality, shall presume to carry a light with him. The flambeaux are extinguished at the Porta Felice, where the servants wait for the return of the carriages; and the company generally continue an hour or two together in utter darkness, except when the intruding moon, with her horns and her chastity, comes to disturb them. The concert finishes about two in the morning, when, for the most part, every husband goes home to his own wife. This is an admirable institution, and never produces any scandal; no husband is such a brute as to deny his wife the Marino; and the ladies are so cautious and circumspect on their side, that the better to avoid giving offence, they very often put on masks.

Their other amusements consist chiefly in their *conversazioni*, of which they have a variety every night. There is one general one, supported by the subscription of the nobility, which is open every evening at sunset, and continues till midnight, when the Marino begins. It better deserves the name of a conversation than any I have seen in Italy; for here the people really come to converse, whereas in Italy they only go to play at cards and eat ices. I have observed that seldom or never one-half of the company is engaged in play, nor do they either play long or deep. There are a number of apartments belonging to this conversation illuminated with wax-lights, and kept exceedingly cool and agreeable; and it is indeed altogether one of the most sensible and comfortable institutions I have seen. Besides this, there are generally a number of particular conversations every night; and what will a good deal surprise you, these are always held in the apartments of the lying-in ladies, for in this happy climate child-bearing is divested of all its terrors, and is only considered as a party of pleasure. This circumstance we were ignorant of till the other morning. The Duke of Verdura, who does us the honours of the place with great attention and politeness, came to tell us we had a visit to make that was indispensable. "The Princess Paterno," said he, "was brought to bed last night, and it is absolutely incumbent on you to pay your respects to her this evening." At first I thought he was in joke, but he assured me he was serious, and that it would be looked upon as a great unpoliteness to neglect it. Accordingly we went about sunset, and found the princess sitting up in her bed, in an elegant undress, with a number of her friends around her. She talked as usual, and seemed to be perfectly well. This conversation is repeated every night during her convalescence, which generally lasts for about eleven or twelve days. This custom is universal; and as the ladies here are pretty frequently confined, there are for the most part three or four of these assemblies going on in the city at the same time.

The Sicilian ladies marry at thirteen or fourteen, and are sometimes grandmothers before they are thirty. The Count Stetela presented us a few days

ago to his cousin, the Princess Partana, who he told us had a great number of children, the eldest of whom was a very fine girl of fifteen. We talked to the princess for half an hour, not in the least doubting all the time that she was the daughter, till at last the young lady came in, and even then it was not easy to say which appeared the handsomest or the youngest. This lady has had twelve children, and is still in her bloom; she assured me that she never enjoyed more perfect health than when she was in childbed; that during the time of her pregnancy she was often indisposed, but that immediately on delivery she was cured of all her complaints, and was capable of enjoying the company of her friends even more than at any other time. I expressed my surprise at this very singular happiness of their climate or constitutions; but she appeared still more surprised when I told her that we lost many of our finest women in childbed, and that even the most fortunate and easy deliveries were attended with violent pain and anguish. She lamented the fate of our ladies, and thanked Heaven that she was born a Sicilian.

What this singularity is owing to, let the learned determine; but it is surely one of the capital blessings of these climates, where the curse that was laid upon Mother Eve seems to be entirely taken off. I don't know how the ladies here have deserved this exemption, as they have at least as much both of Eve and the serpent as ours have, and still retain their appetite as strong as ever for forbidden fruit. It seems hard, that in our own country, and in Switzerland, where the women in general are the chastest in Europe, that this curse should fall the heaviest: it is probably owing to the climate. In cold, but more particularly in mountainous countries, births are difficult and dangerous; in warm and low places they are more easy: the air of the first hardens and contracts the fibres, that of the second softens and relaxes them. In some places in Switzerland, and amongst the Alps, they lose almost one-half of their women in childbed; and those that can afford it often go down to the low countries some weeks before they lie in, and find their deliveries much easier. One may easily conceive what a change it must make upon the whole frame, to add the pressure of a column of air of two or three thousand feet more than it is accustomed to; and if muscular motion is performed by the pressure of the atmosphere, as some have alleged, how much must this add to the action of every muscle! However, if this hypothesis were true, our strength should have been diminished one-third on the top of *Ætna*—which did not appear to be the case—as we had passed through one-third of the quantity of air of the whole atmosphere. I have often thought that physicians pay too little attention to these considerations, and that in skilful hands they might be turned to great account in the cure of many diseases: they only send their patients to such a degree of latitude, but never think of the degree of altitude in the atmosphere. Thus, people with the same complaints are sent to Aix and to Marseilles, although the air in these two places must be essentially different. Marseilles is on the level of the sea, and Aix (as I myself measured it) is near six hundred feet above it. Now, I am persuaded that in such a country as Switzerland, or on such a mountain as *Ætna*, where it is easy at all times to take off a pressure from the human body of many thousand pounds weight, that an ingenious physician might make great discoveries; nor indeed would these discoveries be confined to the changing of the quantity of air that presses on the body, but would likewise be extended to the changing of the quality of the air we breathe, which on the side of *Ætna*, or any very high mountain, is more varied than in travelling through fifty degrees of latitude. I beg pardon for this digression; the only amends I can make is to put it out of my power to trouble you with any more, and thus abruptly assure you how much, &c.

## MANNERS OF THE SICILIANS.

Palermo, June 26.

Our fondness for Palermo increases every day, and we are beginning to look forward with regret to the time of our leaving it, which is now fast approaching. We have made acquaintance with many sensible and agreeable people. The Sicilians appear frank and sincere, and their politeness does not consist in show and grimace, like some of the polite nations of the continent. The viceroy sets the pattern of hospitality, and he is followed by the rest of the nobles. He is an amiable, agreeable man, and I believe is as much beloved and esteemed as a viceroy to an absolute monarch can be. He was in England in his youth, and is still fond of many of our authors, with whom he seems to be intimately acquainted; he speaks the language tolerably well, and encourages the learning of it amongst his people. He may be considered with regard to Naples as what the lord-lieutenant of Ireland is with regard to England, with this trifling difference, that, like his master, he is invested with absolute authority, and keeps his parliament (for he has one, too) in the most perfect subjection. The patriots here, although a very numerous body, have never been able to gain one point—no, nor a place, nor even a pension for a needy friend. Had Lord Townshend the power of the Marquis Fogliano, I suppose your Hibernian squabbles (of which we hear so much, even at this distant corner) would soon have an end. Notwithstanding this great authority, he is affable and familiar, and makes his house agreeable to every body. We go very often to his assemblies, and have dined with him several times: his table is served with elegance and magnificence, much superior, indeed, to that of his Sicilian majesty, who eats off a service of plate at least three hundred years old, very black and rusty indeed: I heard a gentleman ask one day, whilst we were standing round the table, if it had not been dug out of Herculaneum. That of the viceroy is very elegant, and indeed the whole of his entertainments correspond with it; though we have as yet seen nothing here to be compared to the luxury of our feast in the granary at Agrigentum.

The Sicilian cookery is a mixture of the French and Spanish, and the olio still preserves its rank and dignity in the centre of the table, surrounded by a numerous train of fricassées, fricandeans, ragouts, and pet de loup, like a grave Spanish don amidst a number of little smart marquisses. The other nobility, whom we have had occasion to see, are likewise very magnificent in their entertainments, but most particularly in their desserts and ices, of which there is a greater variety than I have seen in any other country. They are very temperate with regard to wine, though, since we have taught them our method of toasting ladies, they are fond of it, and of hob and nobbing with their friends, ringing the two glasses together; this social practice has animated them so much, that they have been sometimes led to drink a greater quantity than they are accustomed to, and they often reproach us with having made them drunkards. In their ordinary living they are very frugal and temperate; and from the sobriety we have seen here, we are now more persuaded that the elevated situation of Agrigentum must be one great cause of its drunkenness.

The Sicilians have always had the character of being very amorous, and surely not without reason. The whole nation are poets, even the peasants; and a man stands a poor chance for a mistress that is not capable of celebrating her praises. I believe it is generally allowed that the pastoral poetry had its origin in this island, and Theocritus, after whom they still copy, will ever be looked upon as the prince of pastoral poets. And indeed in music, too, as well as poetry, the soft, amorous pieces are generally styled *Siciliani*; these they used to play all night under their mistresses'

windows, to express the delicacy of their passion; but serenading is not now so much in fashion as it was during the time of their more intimate connexion with Spain, when it was said by one of their authors that no one could pass for a man of gallantry that had not got a cold, and was sure never to succeed in making love unless he made it in a hoarse voice. The ladies are not now so rigid, and will sometimes condescend to hear a man, even although he should speak in a clear tone. Neither do they any longer require the prodigious martial feats that were then necessary to win them. The attacking of a mad bull, or a wild boar, was reckoned the handsomest compliment a lover could pay to his mistress; and the putting these animals to death softened her heart much more than all the sighing love-sick tales that could be invented. This has been humorously ridiculed by one of their poets. He says that Cupid's little golden dart was now changed into a massy spear, which answered a double purpose, for at the same time that it pierced the tough bull's hide it likewise pierced the tender lady's heart. But these Gothic customs are now confined to Spain, and the gentle Sicilians have reassumed their softness. To tell you the truth, gallantry is pretty much upon the same footing here as in Italy; the establishment of Cicisbees is pretty general, though not quite so universal as on the continent. A breach of the marriage vow is no longer looked upon as one of the deadly sins, and the confessors fall upon easy and pleasant enough methods of making them atone for it. However, female licentiousness has by no means come to such a height as in Italy. We have seen a great deal of domestic happiness—husbands and wives that truly love one another, and whose mutual care and pleasure is the education of their children. I could name a number—the Duke of Verdura, the Prince Partana, the Count Buscemi, and many others who live in the most sacred union. Such sights are very rare on the continent. But indeed the style that young people are brought up in here seems to lay a much more solid foundation for matrimonial happiness than either in France or Italy. The young ladies are not shut up in convents till the day of their marriage, but for the most part live in the house with their parents, where they receive their education, and are every day in company with their friends and relations. From what I can observe, I think they are allowed almost as much liberty as with us. In their great assemblies we often see a club of young people (of both sexes) get together in a corner, and amuse themselves for hours, at cross purposes, or such like games, without the mothers being under the least anxiety; indeed, we sometimes join in these little parties, and find them extremely entertaining. In general, they are quick and lively, and have a number of those *jeux d'esprit*, which I think must ever be proof, in all countries, of the familiar intercourse betwixt the young people of the two sexes; for all these games are insipid, if they are not seasoned by something of that invisible and subtle agency, which renders every thing more interesting in these mixed societies than in the lifeless ones composed of only one part of the species. Thus in Italy, Spain, and Portugal, I have never seen any of these games, in France seldom; but in Switzerland (where the greatest liberty and familiarity are enjoyed amongst the young people), they are numberless.—But the conversation hour is arrived, and our carriage is waiting. Adieu.

## SCULPTURE EXTRAORDINARY.

Palermo, June 28.

THERE are two small countries, one to the east, the other to the west of this city, where the principal nobility have their country palaces. Both these we have visited; there are many noble houses in each of them.

That to the east is called La Bagaria, that to the west Il Colle. We are this instant returned from La Bagaria, and I hasten to give you an account of the ridiculous things we have seen, though perhaps you will not thank me for it.

The palace of the Prince of Valguanera is, I think, by much the finest and most beautiful of all the houses of the Bagaria, but it is far from being the most extraordinary; were I to describe it, I should only tell you of things you have often seen and heard of in other countries; so I shall only speak of one, which, for its singularity, certainly is not to be paralleled on the face of the earth. It belongs to the Prince of P——, a man of immense fortune, who has devoted his whole life to the study of monsters and chimeras, greater and more ridiculous than ever entered into the imagination of the wildest writers of romance or knight-errantry.

The amazing crowd of statues that surround his house, appear at a distance like a little army drawn up for its defence; but when you get amongst them, and every one assumes his true likeness, you imagine you have got into the regions of delusion and enchantment; for of all that immense group, there is not one made to represent any object in nature, nor is the absurdity of the wretched imagination that created them less astonishing than its wonderful fertility. It would require a volume to describe the whole, and a sad volume indeed it would make. He has put the heads of men to the bodies of every sort of animal, and the heads of every other animal to the bodies of men. Sometimes he makes a compound of five or six animals that have no sort of resemblance in nature. He puts the head of a lion to the neck of a goose, the body of a lizard, the legs of a goat, the tail of a fox. On the back of this monster he puts another, if possible still more hideous, with five or six heads, and a bush of horns, that beats the beast in the Revelations all to nothing. There is no kind of horn in the world that he has not collected, and his pleasure is to see them all flourishing upon the same head. This is a strange species of madness, and it is truly unaccountable that he has not been shut up many years ago; but he is perfectly innocent, and troubles nobody by the indulgence of his frenzy; on the contrary, he gives bread to a number of statues and other workmen, whom he rewards in proportion as they can bring their imaginations to coincide with his own, or, in other words, according to the hideousness of the monsters they produce. It would be idle and tiresome to be particular in an account of these absurdities. The statues that adorn or rather deform the great avenue, and surround the court of the palace, amount already to six hundred; notwithstanding which, it may be truly said, that he has not broke the second commandment, for of all that number, there is not the likeness of any thing in heaven above, in the earth beneath, or in the waters under the earth. The old ornaments which were put up by his father, who was a sensible man, appear to have been in a good taste. They have all been knocked to pieces, and laid together in a heap, to make room for this new creation.

The inside of this enchanted castle corresponds exactly with the out; it is in every respect as whimsical and fantastical, and you cannot turn yourself to any side where you are not stared in the face by some hideous figure or other. Some of the apartments are spacious and magnificent, with high arched roofs, which, instead of plaster or stucco, are composed of large mirrors, nicely joined together. The effect that these produce (as each of them make a small angle with the other) is exactly that of a multiplying glass, so that when three or four people are walking below, there is always the appearance of three or four hundred walking above. The whole of the doors are likewise covered over with small pieces of mirror, cut into the most ridiculous shapes, and intermixed with a great variety of crystal and glass of different colours.

All the chimney-pieces, windows, and sideboards are crowded with pyramids and pillars of teapots, cauldrons, bowls, cups, saucers, &c., strongly cemented together; some of these columns are not without their beauty; one of them has a large china chamber-pot for its base, and a circle of pretty little flower-pots for its capital, the shaft of the column, upwards of four feet long, is composed entirely of teapots of different sizes, diminished gradually from the base to the capital. The profusion of china that has been employed in forming these columns is incredible: I daresay there is not less than forty pillars and pyramids formed in this strange fantastic manner.

Most of the rooms are paved with fine marble tables of different colours, that look like so many tombstones. Some of these are richly wrought with lapis lazuli, porphyry, and other valuable stones; their fine polish is now gone, and they only appear like common marble; the place of these beautiful tables he has supplied by a new set of his own invention, some of which are not without their merit. These are made of the finest tortoise-shell mixed with mother-of-pearl, ivory, and a variety of metals, and are mounted on fine stands of solid brass.

The windows of this enchanted castle are composed of a variety of glass of every different colour, mixed without any sort of order or regularity—blue, red, green, yellow, purple, violet; so that at each window you may have the heavens and earth of whatever colour you choose, only by looking through the pane that pleases you.

The house-clock is cased in the body of a statue; the eyes of the figure move with the pendulum, turning up their white and black alternately, and make a hideous appearance.

His bedchamber and dressing-room are like two apartments in Noah's ark; there is scarce a beast, however vile, that he has not placed there—toads, frogs, serpents, lizards, scorpions, all cut out in marble of their respective colours. There are a good many busts, too, that are not less singularly imagined. Some of these make a very handsome profile on one side; turn to the other, and you have a skeleton; here you see a nurse with a child in her arms—its back is exactly that of an infant, its face is that of a wrinkled old woman of ninety.

For some minutes one can laugh at these follies, but indignation and contempt soon get the better of your mirth, and the laugh is turned into a sneer. I own I was soon tired of them; though some things are so strangely fancied, that it may well excuse a little mirth, even from the most rigid cynic.

The family statues are charming; they have been done from some old pictures, and make a most venerable appearance; he has dressed them out from head to foot in new and elegant suits of marble; and indeed the effect it produces is more ridiculous than any thing you can conceive. Their shoes are all of black marble, their stockings generally of red; their clothes are of different colours, blue, green, and variegated, with a rich lace of *giall' antique*. The periwigs of the men and head-dresses of the ladies are of fine white; so are their shirts, with long flowing ruffles of alabaster. The walls of the house are covered with some fine *basso relievo*s of white marble, in a good taste; these he could not well take out or alter, so he has only added immense frames to them. Each frame is composed of four large marble tables.

The author and owner of this singular collection is a poor miserable lean figure, shivering at a breeze, and seems to be afraid of every body he speaks to; but (what surprised me) I have heard him talk speciously enough on several occasions. He is one of the richest subjects in the island, and it is thought he has not laid out less than twenty thousand pounds in the creation of this world of monsters and chimeras. He certainly might have fallen upon some way to prove himself a fool at a cheaper rate. However, it gives bread to a

number of poor people, to whom he is an excellent master. His house at Palermo is a good deal in the same style; his carriages are covered with plates of brass, so that I really believe some of them are musket-proof.

The government have had serious thoughts of demolishing the regiment of monsters he has placed round his house, but as he is humane and inoffensive, and as this would certainly break his heart, they have as yet forbore. The ladies complain that they dare no longer take an airing in the Bagaria; that some hideous form always haunts their imagination for some time after: their husbands too, it is said, are as little satisfied. Adieu. I shall write you again by next post, as matter multiplies fast upon me in this metropolis. Ever yours.

~~~~~

#### SINGULAR CEMETERY IN PALERMO.—VALUE OF A CARRIAGE.

Palermo, June 30.

THE account the people here give of the sirocco, or south-east wind, is truly wonderful; to-day, at the viceroy's, we were complaining of the violence of the heat, the thermometer being at 79 degrees. They assured us that if we stayed till the end of next month we should probably look on this as pleasant cool weather; adding, that if we had once experienced the sirocco, all other weather would appear temperate. I asked to what degree the thermometer commonly rose during this wind, but found, to my surprise, that there was no such instrument in use amongst them: however, the violence of it, they assure us, is incredible; and that those who had remained many years in Spain and Malta had never felt any heat in those countries to compare to it. How it happens to be more violent in Palermo than in any other part of Sicily, is a mystery that still remains to be unfolded. Several treatises have been written on this subject, but none that give any tolerable degree of satisfaction. As we shall stay for some time longer, it is possible we may have an opportunity of giving you some account of it.

They have begun some weeks ago to make preparations for the great feast of St Rosalia; and our friends here say they are determined that we shall not leave them till after it is over; but this I am afraid will not be in our power. The warm season advances, and the time we appointed for our return to Naples is already elapsed; but, indeed, return when we will, we shall make but a bad exchange; and were it not for those of our own country whom we have left behind us, we certainly should have determined on a much longer stay. But although the society here is superior to that of Naples, yet—call it prejudice, or call it what you will—there is a *je ne sçai quoi*—a certain confidence in the character, the worth, and friendship of our own people, that I have seldom felt any where on the continent, except in Switzerland. This sensation, which constitutes the charm of society, and can alone render it supportable for any time, is only inspired by something analogous and sympathetic in our feelings and sentiments, like two instruments that are in unison, and vibrate to each other's touch; for society is a concert, and if the instruments are not in tune there never can be harmony; and (to carry on the metaphor) this harmony, too, must sometimes be heightened and supported by the introduction of a discord; but where discords predominate, which is often the case between an English and an Italian mind, the music must be wretched indeed. Had we but a little mixture of our own society, how gladly should we spend the winter in Sicily; but we often think with regret on Mr Hamilton's and Mr Walter's families, and wish again to be on the continent. Indeed, even the pleasures we enjoy here, we owe principally to Mr Hamilton: his recommendations we have ever found to be the best passport

and introduction; and the zeal and cordiality with which these are always received, proceed evidently not from motives of deference and respect to the minister, but of love and affection to the man.

This morning we went to see a celebrated convent of Capuchins, about a mile without the city; it contains nothing very remarkable but the burial-place, which indeed is a great curiosity. This is a vast subterraneous apartment, divided into large commodious galleries, the walls on each side of which are hollowed into a variety of niches, as if intended for a great collection of statues; these niches, instead of statues, are all filled with dead bodies, set upright upon their legs, and fixed by the back to the inside of the niche: their number is about three hundred: they are all dressed in the clothes they usually wore, and form a most respectable and venerable assembly. The skin and muscles, by a certain preparation, become as dry and hard as a piece of stock-fish; and although many of them have been here upwards of two hundred and fifty years, yet none are reduced to skeletons; the muscles, indeed, in some appear to be a good deal more shrunk than in others, probably because these persons had been more attenuated at the time of their death.

Here the people of Palermo pay daily visits to their deceased friends, and recall with pleasure and regret the scenes of their past life: here they familiarise themselves with their future state, and choose the company they would wish to keep in the other world. It is a common thing to make choice of their niche, and to try if their body fits it, that no alterations may be necessary after they are dead; and sometimes, by way of a voluntary penance, they accustom themselves to stand for hours in these niches.

The bodies of the princes and first nobility are lodged in handsome chests or trunks, some of them richly adorned; these are not in the shape of coffins, but all of one width, and about a foot and a half or two feet deep. The keys are kept by the nearest relations of the family, who sometimes come and drop a tear over their departed friends.

I am not sure if this is not a better method of disposing of the dead than ours. These visits must prove admirable lessons of humility, and I assure you, they are not such objects of horror as you would imagine: they are said, even for ages after death, to retain a strong likeness to what they were when alive, so that, as soon as you have conquered the first feeling excited by these venerable figures, you only consider this as a vast gallery of original portraits, drawn after the life, by the justest and most unprejudiced hand. It must be owned that the colours are rather faded, and the pencil does not appear to have been the most flattering in the world; but no matter, it is the pencil of truth, and not of a mercenary, who only wants to please. We were alleging, too, that it might be made of very considerable utility to society, and that these dumb orators could give the most pathetic lectures upon pride and vanity. Whenever a fellow began to strut, like Mr B., or to affect the haughty supercilious air, he should be sent to converse with his friends in the gallery, and if their arguments did not bring him to a proper way of thinking, I would give him up as incorrigible.

At Bologna they showed us the skeleton of a celebrated beauty, who died at a period of life when she was still the object of universal admiration. By way of making atonement for her own vanity, she bequeathed herself as a monument, to curb the vanity of others. Recollecting on her deathbed the great adulation that had been paid to her charms, and the fatal change they were soon to undergo, she ordered that her body should be dissected, and her bones hung up for the inspection of all young maidens who are inclined to be vain of their beauty. However, if she had been preserved in this moral gallery, the lesson would have been stronger, for those very features that

had raised her vanity would still have remained, only disarmed of all their power, and divested of every charm.\*

Some of the capuchins sleep in these galleries every night, and pretend to have many wonderful visions and revelations; but the truth is, that very few people believe them.

No woman is ever admitted into this convent either dead or alive; and this interdiction is written in large characters over the gate. The poor indolent capuchins, the frailest of all flesh, have great need of such precautions; they have no occupation from without, and they have no resources within themselves, so that they must be an easy prey to every temptation: Boccaccio, and all the books of that kind, are filled with stories of their frailty.

We had no sooner left the capuchin convent, than our carriage broke down, long before we reached the city; and as walking (at Palermo as well as Naples) is of all things the most disgraceful, we risked by this unfortunate accident to have our characters blasted for ever. However, Philip, our Sicilian servant, took care to make such a noise about it, that our dignity did not much suffer. He kept a little distance before us, pesting and blasting all the way at their cursed crazy carriages, and swearing that there never was any thing in the world so infamous, that in a city like Palermo, the capital of all Sicily, signori of our rank and dignity should be obliged to walk on foot; that it must be an eternal reflection against the place; and bawled out to every person he met, if there was no coaches to be had, no carriages of any kind, either for love or money. In short, we had not got half through the street, before we had several offers from gentlemen of our acquaintance, who lamented exceedingly the indignity we had suffered, and wondered much that we did not rather send forward a servant for another coach, and wait (in the heat of the sun) till it arrived.

This is not the only time that Philip's wits have

\* ["Before I conclude with Palermo, I wish to give an account of a most strange sight which is to be witnessed there; I mean the sepulchral vaults of a convent of Capuchins, situated about a mile from the city. They have been dug in a soil which possesses the remarkable property of drying, and preserving from decay, the corpses which are placed there. I am not aware whether this preservation merely arises from the drying qualities of the soil, or whether the bodies undergo a previous process; for here they make a mystery of every thing, and it is hardly possible to consider this subject in any other than a picturesque point of view. Be this as it may, this property does not belong exclusively to this vault, for the bone-house of the Cordeliers of Toulouse, and that of the Jacobins of the same city, were formerly celebrated for producing similar effects. It was there that they preserved among other corpses that of the beautiful Paula, and the curious anxiously seek among these disfigured remains for some traces of that wonderful beauty, the extraordinary accounts of which it is difficult to believe. These catacombs, according to the statement of travellers, are more curious than those of Sicily, for it is said that the enclosure of one part of the walls possessed the property of preserving bodies, whilst the opposite part did not possess that faculty.

The subterranean parts of the Capuchin Convent at Palermo are divided into a great number of galleries, in the walls of which many niches have been cut, as if it had at first been intended to place statues there; but now there are ranges of monuments, which are much more expressive than statues. These are dead bodies. Monks and nobles, priests and laymen, are there to be seen standing in the costume of their rank or profession. Each of these corpses occupies a small cell, to which it is attached by the back. It must not be imagined by this description that they resemble a collection of mummies. They seem to have preserved their vitality, and to move and gesticulate, and some *Cicerones* even pretend that they have sometimes spoken to the astonished tourist. As, with the exception of their clothing, these corpses are not at all confined, and their members are not in the least restrained, they are subject to no other influences than the curious phenomena which result from the greater or lesser degree of contractibility of their tissues. Some of them are as still and upright as a sentinel in his box; others, on the contrary, seem to

been of service to us on such occasions. A few nights ago, we had a dispute with our coachman, turned him off, and had not provided another. We were unfortunately engaged to go to the great conversation. What was to be done? No such thing as walking. Should we be caught in the fact, we are disgraced for ever. No alternative, however. There was not a coach to be had, and our old coachman would not serve us for one night only. Philip made sad wry faces, and swore the coachman ought to be crucified; but when he saw us bent on walking, he was still more distressed, and I really believe, if we had been discovered, that he would not have served us any longer. He therefore set his wits to work, how he should preserve both his masters' honour and his own place. He at first hesitated before he would take up the flambeau; but he would by no means be prevailed on to light it. "What!" said Philip, "do you think I have no more regard for you than to expose you to the eyes of the whole world? No, no, gentlemen; if you will bring yourselves to disgrace, you shall not at least make me the agent of showing it: but remember, if you are observed walking, no mortal will believe you keep a coach; and do you expect after that to be received into company?" "Well, well, Philip, do as you please, but we must go to the conversation." Philip shrugged up his shoulders, led the way, and we followed.

Philip had studied the geography of the town; he conducted us through lanes only known to himself, and carefully avoided the great street: till at last we arrived at a little entry, which leads to the conversation rooms; here the carriages usually stop. We slipped up the entry in the dark; when Philip, darting into a shop, lighted his flambeau in an instant, and came rushing before us, bawling out, "*Piazza per gli signori forestieri*"—["Make room for the foreign gentlemen"]; when all the world immediately made way for us. After we had got into the rooms, he called so loud after us, asking at what time he should order the coach to return, that, overcome partly by

being in different positions; others, again, are thrown backward, and their members are distorted as if they were suffering horrible torments. One appears in a state of demoniac fury; you see another like a victim tied to the stake; and, farther on, one whose grotesque postures and manners remind you of the buffoonery of a clown. There is, indeed, no violent passion or exaggerated expression which does not find a representation here.

Though some of these corpses have been here for nearly three hundred years, yet it would be in vain to look for a single skeleton, as all their muscles and skin are preserved entire. An old monk with a long white beard has, by his own choice, taken up his residence in this melancholy abode, and he never leaves it. His only companion is a large cat, which continually follows him. The inhabitants of Palermo visit this dismal abode daily, and it is with many of them an object of ambition to obtain a place there. It is not, as I am assured, curiosity alone, nor a desire to render the last sad duties to their friends, which frequently directs their steps thither. They often come in order to examine the place, and to choose beforehand the spot which they would desire one day to occupy. They coolly calculate the advantages of such and such a position, and discuss the merits of those who will be their neighbours. On these occasions, they jocularly remark, that when one undertakes so long a journey, it is impossible to be too difficult in the choice of companions. When they have made up their minds, they have the niches formed, and come from time to time to see if they are of the proper size, frequently suggesting alterations and improvements.

This abode of melancholy, however, has its *fete day*—the *jour des morts*. Upon that solemn occasion the darkness is dissipated by the lustre of the illuminations, and the accustomed stillness is replaced by the clamour of crowds of spectators. The dead bodies are previously decked out in stylish array; the old clothing of the last year is substituted by new, which is to serve for the next; and in order that nothing shall be wanting to set them off, nosegays are placed in their hands, and their foreheads are sprinkled with odoriferous scents; but, as is the case in the cemeteries in France, this pious and melancholy duty is never fulfilled by wives and mothers; for, by a strange law, no living woman is allowed to visit this tomb, and no dead one to inhabit it."—*Journal of M. P. E. Botta.*]

risibility, and partly by a consciousness of the deceit, not one of us had power to answer him. Philip, however, followed us, and repeated the question so often, that we were obliged to tell him, at midnight. At midnight, accordingly, he came to tell us that the coach was ready. We were curious to see how he would behave on this occasion; for it was not half so difficult to get in unobserved, as to get out: however, Philip's genius was equal to both. As soon as we got into the entry, he ran to the door, bawling out Antonio as hard as he could roar. No Antonio answered; and, unfortunately, there was a number of gentlemen and ladies going away at the same time. They begged of us as strangers to step first into our carriage, and absolutely refused to go out before us. Philip was sadly puzzled. He first ran up the street, then he ran down, and came back all out of breath, cursing Antonio. "That rascal," said he, "is never in the way, and you must turn him off. He pretends that he could not get up his coach to the door, for the great crowd of carriages; and is waiting about fifty yards below. *Vostri eccellenzi* had better step down," said Philip, "otherwise you will be obliged to wait here at least half an hour." We took leave of the company, and set off. Philip ran like a lamplighter, till he had almost passed the carriages, when, dashing his flambeau on the ground, as if by accident, he extinguished it, and getting into a narrow lane, he waited till we came up; when he whispered us to follow him—and conducted us back by the same labyrinth we had come; and thus saved us from eternal infamy. However, he assures us he will not venture it again for his place.

Now, what do you think of a nation where such prejudices as these prevail? It is pretty much the case all over Italy. An Italian nobleman is ashamed of nothing so much as making use of his legs. They think their dignity augmented by the repose of their members, and that no man can be truly respectable that does not lol away one-half of his time on a sofa or in a carriage. In short, a man is obliged to be indolent and effeminate not to be despised and ridiculous. What can we expect of such a people? Can they be capable of any thing great or manly, who seem almost ashamed to appear men? I own it surpasses my comprehension, and I bless my stars every time that I think of honest John Bull, even with all his faults. Will you believe me that, of all that I have known in Italy, there are scarce half a dozen that have had fortitude enough to subdue this most contemptible of all human prejudices? The Prince of Campo Franco, too, in this place, is above it. He is a noble fellow, and, both in his person and character, greatly resembles our late worthy friend, General Craufurd. He is a major-general, too, and always dresses in his uniform, which further increases the resemblance. Every time I see him, he says or does something that recalls strongly to my mind the idea of our noble general. He laughs at the follies of his country, and holds these wretched prejudices in that contempt they deserve. "What would the old hardy Romans think," said he, talking on this subject, "were they permitted to take a view of the occupations of their progeny? I should like to see a Brutus or a Cassius amongst us for a little; how the clumsy vulgar fellows would be hooted. I dare say they would soon be glad to return to the shades again."

Adieu. For some nights past we have been observing the course of a comet; and as we were the first people here that took notice of it, I assure you we are looked upon as very profound astronomers. I shall say more of it in my next. We have now got out of our abominable inn, and have taken a final leave of our French landlady. The Count Bushemi, a very amiable young man, has been kind enough to provide us a lodging on the sea-shore, one of the coolest and most agreeable in Palermo. Ever yours, &c.

#### A COMET.—ASTRONOMICAL SPECULATIONS.

*Palermo, July 2.*

OUR comet is now gone; we first observed it on the 24th. It had no tail, but was surrounded with a faintish ill-defined light, that made it look like a bright star shining through a thin cloud. This, in all probability, is owing to an atmosphere around the body of the comet that causes a refraction of the rays, and prevents them from reaching us with that distinctness we observe in bodies that have no atmosphere. We were still the more persuaded of this two nights ago, when we had the good fortune to catch the comet just passing close by a small fixed star, whose light was not only considerably dimmed, but we thought we observed a sensible change of place in the star, as soon as its rays fell into the atmosphere of the comet, owing no doubt to the refraction in passing through that atmosphere. We attempted to trace the line of the comet's course, but as we could find no globe, it was not possible to do it with any degree of precision. Its direction was almost due north, and its velocity altogether amazing. We did not observe it so minutely the two or three first nights of its appearance, but on the 30th it was at our zenith here (latitude 38 degrees 10 minutes, longitude from London 13 degrees), about five minutes after midnight; and last night, the first of July, it passed four degrees to the east of the polar star, nearly at forty minutes after eight; so that, in less than twenty-four hours, it has described a great arch in the heavens, upwards of fifty degrees, which gives an idea of the most amazing velocity. Supposing it at the distance of the sun, at this rate of travelling, it would go round the earth's orbit in less than a week, which makes, I think, considerably more than sixty millions of miles in a day, a motion that vastly surpasses all human comprehension. And as this motion continues to be greatly accelerated, what must it be when the comet approaches still nearer to the body of the sun! Last night a change of place was observable in the space of a few minutes, particularly when it passed near any of the fixed stars. We attempted to find if it had any observable parallax, but the vast rapidity of its motion always prevented us, for whatever fixed stars it was near in the horizon, it had got so far to the north of them, long before it reached the meridian, that the parallax, if there was any, entirely escaped us.

I shall long much to see the observations that have been made with you, and in other distant countries, on this comet, as from these we shall probably be enabled to form some judgment of its distance from the earth, which, although we could observe no parallax, I am apt to believe was not very great, as its motion was so very perceptible. We could procure no instruments to measure its apparent distance from any of the fixed stars, so that the only two observations any thing can be made of are the time of its passing the polar star last night, its distance from it, and the time of its arrival at our zenith on the 30th; this we found by applying the eye to a straight rod, hung perpendicularly from a small thread. The comet was not in the exact point of the zenith, but, to the best of our observation, about six or seven minutes to the north of it. Last night it was visible almost immediately after sunset, long before any of the fixed stars appeared. It is now immersed in the rays of the sun, and has certainly got very near his body. If it returns again to the regions of space, it will probably be visible in a few days; but I own I should much doubt of any such return, if it is really by the attractive force of the sun that it is at present carried with such amazing celerity towards him. This is the third comet of this kind whose return I have had an opportunity of watching, but never was fortunate enough to find any of them after they had passed the sun, though those that do

really return appear at that time much more luminous than before they approached him.\*

The astronomy of comets, from what I can remember of it, appears to be clogged with very great difficulties, and even some seeming absurdities. It is difficult to conceive that these immense bodies, after being drawn to the sun with the velocity of a million of miles in an hour, when they have at last come almost to touch him, should then fly off from his body with the same velocity they approach it, and that too by the power of this very motion that his attraction has occasioned. The demonstration of this, I remember, is very curious and ingenious, but I wish it may be entirely free from sophistry. No doubt, in bodies moving in curves round a fixed centre, as the centripetal motion increases, the centrifugal one increases likewise; but how this motion, which is only generated by the former, should at last get the better of the power that produces it, and that too at the very time this power has acquired its utmost force and energy, seems somewhat difficult to conceive. It is the only instance I know wherein the effect increasing regularly with the cause, at last, whilst the cause is still acting with full vigour, the effect entirely gets the better of the cause, and leaves it in the lurch. For the body attracted is at last carried away with infinite velocity from the attracting body. By what power is it carried away? Why, say our philosophers, by the very power of this attraction, which has now produced a new power superior to itself, to wit, the centrifugal force. However, perhaps all this may be reconcilable to reason: far be it from me to presume attacking so glorious a system as that of attraction. The law that the heavenly bodies are said to observe, in describing equal areas in equal times, is supposed to be demonstrated, and by this it would appear that the centripetal and centrifugal forces alternately get the mastery of one another.

However, I cannot help thinking it somewhat hard to conceive that gravity should always get the better of the centrifugal force at the very time that its action is the smallest, when the comet is at its greatest distance from the sun; and that the centrifugal force should get the better of gravity at the very time that its action is the greatest, when the comet is at its nearest point to the sun.

To a common observer it would rather appear that the sun, like an electric body, after it had once charged the objects that it attracted with its own effluvia or atmosphere, by degrees loses its attraction, and at last even repels them; and that the attracting power, like what we likewise observe in electricity, does not return again till the effluvia imbibed from the attracting body is dispelled or dissipated, when it is again attracted, and so on alternately. For it appears (at least to an unphilosophical observer) somewhat repugnant to reason, to say that a body flying off from

another body some thousands of miles in a minute, should all the time be violently attracted by that body, and that it is even by virtue of this very attraction that it is flying off from it. He would probably ask, what more could it do, pray, were it really to be repelled?

Had the system of electricity, and of repulsion as well as attraction, been known and established in the last age, I have little doubt that the profound genius of Newton would have called it to his aid, and perhaps accounted in a more satisfactory manner for many of the great phenomena of the heavens. To the best of my remembrance, we know of no body that possesses, in any considerable degree, the power of attraction, that in certain circumstances does not likewise possess the power of repulsion—the magnet, the tourmalin, amber, glass, and every electrical substance. Now, from analogy, as we find the sun so powerfully endowed with attraction, why may we not likewise suppose him to be possessed of repulsion? Indeed, this very power seems to be confessed by the Newtonians to reside in the sun in a most wonderful degree, for they assure us he repels the rays of light with such amazing force, that they fly upwards of eighty millions of miles in seven minutes. Now, why should we confine this repulsion to the rays of light only? As they are material, may not other matter brought near his body be affected in the same manner? Indeed, one would imagine that their motion alone would create the most violent repulsion, and that the force with which they are perpetually flowing from the sun would most effectually prevent every other body from approaching him; for this we find is the constant effect of a rapid stream of any other matter. But let us examine a little more his effects on comets. The tails of these bodies are probably their atmospheres, rendered highly electrical, either from the violence of their motion or from their proximity to the sun. Of all the bodies we know, there is none in so constant and so violent an electrical state as the higher regions of our own atmosphere. Of this I have long been convinced; for send up a kite with a small wire about its string only to the height of twelve or thirteen hundred feet, and at all times it will produce fire, as I have found by frequent experience—sometimes when the air was perfectly clear, without a cloud in the hemisphere, at other times when it was thick and hazy, and totally unfit for electrical operations below. Now, as this is the case at so small a height, and as we find the effect still grows stronger in proportion as the kite advances (for I have sometimes observed that a little blast of wind suddenly raising the kite about an hundred feet has more than doubled the effect), what must it be in very great elevations? Indeed we may often judge of it from the violence with which the clouds are agitated, from the meteors formed above the region of the clouds, and particularly from the aurora borealis, which has been observed to have much the same colour and appearance as the matter that forms the tails of comets.

Now, what must be the effect of so vast a body as our atmosphere, made strongly electrical, when it happens to approach any other body? It must always be either violently attracted or repelled, according to the positive or negative quality (in the language of electricians) of the body that it approaches.

It has ever been observed that the tails of comets (just as we should expect from a very light fluid body attached to a solid heavy one) are drawn after the comets as long as they are at a distance from the sun; but as soon as the comet gets near his body, the tail veers about to that side of the comet that is in the opposite direction from the sun, and no longer follows the comet, but continues its motion sideways, opposing its whole length to the medium through which it passes, rather than allow it in any degree to approach the sun. Indeed its tendency to follow the

\* [Mr Brydone's speculations on this comet and on comets in general are rather too much protracted, and, though ingenious, considering the state of science in his day, are now superseded by more correct observations. The return of comets from the sun is now undoubted, and the periods of many have been ascertained. The idea of their falling into the sun, on which Mr Brydone bestows so much attention, is not now, to our knowledge, entertained by any astronomer of reputation. The reader, in perusing the ensuing pages, is apt to be surprised that, so lately as 1770, any doubt should have remained respecting the Newtonian laws of motion. These bodies, in reality, although approaching so near to the sun, are as duly subject as the least eccentric bodies in our system, to the law with regard to bodies describing equal areas in equal times: the nearness is exactly compensated by the rapidity. It is also curious to find Newton's theory of light drawn in to give countenance to the supposition that comets fall into the sun. This theory is at present under doubt, and that which represents light as an imponderable agent is more generally received. Perhaps this very notion of Brydone as to the necessity of a supply of new matter to the sun to make up for that which he is supposed to be constantly losing in the shape of light, is one of the strongest arguments which could be adduced against the doctrine that light is substantial.]

body of the comet is still observable, were it not prevented by some force superior to that tendency, for the tail is always observed to bend a little to that side from whence the comet is flying. This perhaps is some proof, too, that it does not move in an absolute vacuum.

When the comet reaches its perihelion, the tail is generally very much lengthened, perhaps by the rarefaction from the heat, perhaps by the increase of the sun's repulsion, or that of his atmosphere. It still continues projected exactly in the opposite direction from the sun; and when the comet moves off again to the regions of space, the tail, instead of following it as it did on its approach, is projected a vast way before it, and still keeps the body of the comet exactly opposed betwixt it and the sun; till by degrees, as the distance increases, the length of the tail is diminished, the repulsion probably becoming weaker and weaker.

It has likewise been observed that the length of these tails is commonly in proportion to the proximity of the comet to the sun. That of 1680 threw out a train that would almost have reached from the sun to the earth. If this had been attracted by the sun, would it not have fallen upon his body, when the comet at that time was not one-fourth of his diameter distant from him?—but instead of this, it was darted away to the opposite side of the heavens, even with a greater velocity than that of the comet itself. Now what can this be owing to, if not to a repulsive power in the sun or his atmosphere?

And, indeed, it would at first appear but little less absurd to say, that the tail of the comet is all this time violently attracted by the sun, although it be driven away in an opposite direction from him, as to say the same of the comet itself. It is true, this repulsion seems to begin much sooner to affect the tail than the body of the comet, which is supposed always to pass the sun before it begins to fly away from him, which is by no means the case with the tail. The repulsive force, therefore (if there is any such), is in a much less proportion than the attractive one, and probably just only enough to counterbalance the latter, when these bodies are in their perihelions, and to turn them so much inside as to prevent their falling into the body of the sun. The projectile force they have acquired will then carry them out to the heavens, and repulsion probably diminishing as they recede from the sun's atmosphere, his attraction will again take place, and retard their motion regularly, till they arrive at their aphelia, when they once more begin to return to him.

I don't know you will like all this. Our comet has led me a dance I very little thought of; and I believe I should have done better to send it at once into the sun, and had done with it: and that, indeed, I am apt to believe, will be its fate. For as this comet has no tail, there is, of consequence, no apparent repulsion. If it was repelled, its atmosphere, like the others, would be driven away in the opposite direction from the sun; I therefore do not see any possible method it has of escaping.

These comets are certainly bodies of a very different nature from those with tails, to which, indeed, they appear even to bear a much less resemblance than they do to planets; and it is no small proof of the little progress we have made in the knowledge of the universe, that they have not as yet been distinguished by a different name.

This is the third kind of body that has been discovered in our system, that all appear essentially different from each other, that are probably regulated by different laws, and intended for very different purposes. How much will posterity be astonished at our ignorance, and wonder that this system should have existed for so many thousand years, before we were in the least acquainted with one-half of it, or had even invented names to distinguish its different members!

I have no doubt that in future ages the number of the comets, the form of their orbits, and time of their revolutions, will be as clearly demonstrated as that of the planets. It is our countryman, Dr Halley, who has begun this great work, which may be considered just now as in its earliest infancy. These bodies, too, with thick atmospheres, but without tails, will likewise have their proper places ascertained, and will no longer be confounded with bodies to which they bear no resemblance or connexion.

Comets with tails have seldom been visible but on their recess from the sun. It is he that kindles them up, and gives them that alarming appearance in the heavens. On the contrary, those without tails have seldom, perhaps never, been observed, but on their approach to him. I don't recollect any whose return has been tolerably well ascertained. I remember, indeed, a few years ago, a small one, that was said to have been discovered by a telescope, after it had passed the sun, but never more became visible to the naked eye. This assertion is easily made, and nobody can contradict it; but it does not at all appear probable that it should have become so much less luminous after it had passed the sun than before it approached him; and I will own to you, when I have heard that the return of these comets had escaped the eyes of the most acute astronomers, I have been tempted to think that they did not return at all, but were absorbed in the body of the sun, which their violent motion towards him seemed to indicate. Indeed, I have often wished that this discovery might be made, as it would in some measure account for what has as yet been looked upon as unaccountable—that the sun, notwithstanding his daily waste from enlightening the universe, never appears diminished either in size or light. Surely this waste must be immense; and were there not in nature some hidden provision for supplying it, in the space of six thousand years, supposing the world to be no older, the planets must have got to a much greater distance from his body, by the vast diminution of his attraction; they must likewise have moved much slower, and consequently the length of our year must have been greatly increased. Nothing of all this seems to be the case: the diameter of the sun is the same as ever it was; he neither appears diminished, nor our distance from him increased; his light, heat, and attraction, seem to be the same as ever, and the motion of the planets round him is performed in the same time: of consequence, his quantity of matter still continues the same. How, then, is this vast waste supplied? May there not be millions of bodies attracted by him, from the boundless regions of space, that are never perceived by us? Comets, on their road to him, have several times been accidentally discovered by telescopes that were never seen by the naked eye. Indeed, the number of black spots on the sun seem to indicate that there is always a quantity of matter there, only in a preparation to give light, but not yet refined and pure enough to throw off rays like the rest of his body. For I think we can hardly conceive, that any matter can remain long on the body of the sun without becoming luminous; and so we find these spots often disappear, that is to say, the matter of which they are composed is then perfectly melted, and has acquired the same degree of heat and light as the rest of his body. Even in our glass-houses, and other very hot furnaces, most sorts of matter very soon acquire the same colour and appearance as the matter in fusion, and emit rays of light like it. But how much more must this be the case at the surface of the sun, when Newton computes, that even at many thousand miles' distance from it, a body would acquire a degree of heat two thousand times greater than that of red-hot iron? It has generally been understood, that he said the great comet really did acquire this degree of heat; but this is certainly a mistake: Sir Isaac's expression, to the best of my remembrance, is, that it might have acquired it.

And if we consider the very great size of that body, and the short time of its perihelion, the thing will appear impossible: nor, indeed, do I think we can conceive that a body only as large as our earth (and the spots on the sun are often much larger) could be reduced to fusion, even on his surface, but after a very considerable space of time.

Now, as it seems to be universally supposed that the rays of light are really particles of matter proceeding from the body of the sun, I think it is absolutely necessary that we should fall upon some such method of sending him back a supply of those rays, otherwise, let his stock be ever so great, it must at last be exhausted.

I wish astronomers would observe whether the spots on the sun are not increased after the appearing of these comets, and whether these spots do not disappear again by degrees, like a body that is gradually melted down in a furnace. But there is another consideration, too, which naturally occurs: pray, what becomes of all this vast quantity of matter after it is reduced to light? Is it ever collected again into solid bodies, or is it for ever lost and dissipated after it has made its journey from the sun to the object it illuminates? It is somewhat strange, that of all that immense quantity of matter poured down on us during the day, that pervades and fills the whole universe, the moment we are deprived of the luminous body, the whole of it, in an instant, seems to be annihilated; in short, there are a number of difficulties attending the commonly received doctrine of light; nor do I think there is any point in natural philosophy the solution of which is less satisfactory. If we suppose every ray to be a stream of particles of matter, darting from the luminous body, how can we conceive that these streams may be intersected and pierced by other streams of the same matter, ten thousand different ways, without causing the least confusion either to the one or the other?—for in a clear night we see distinctly any particular star that we look at, although the rays coming from that star to our eye are pierced for millions of miles before they reach us, by millions of streams of the same rays, from every other sun and star in the universe. Now suppose, in any other matter that we know of—and one would imagine there ought at least to be some sort of analogy—suppose, I say, we should only attempt to make two streams pass one another—water, for instance, or air, one of the purest and the most fluid substances we are acquainted with—we find it totally impossible. The two streams will mutually interrupt and incommode one another, and the strongest will ever carry off the weakest into its own direction; but if a stream of light is hit by ten thousand other streams, moving at the rate of ten millions of miles in a minute, it is not even bent by the impression, nor in the smallest degree diverted from its course; but reaches us with the same precision and regularity as if nothing had interfered with it. Besides, on the supposition that light is real particles of matter moving from the sun to the earth in the space of seven minutes, how comes it to pass, that with all this wonderful velocity, there seems to be no momentum? for it communicates motion to no body that obstructs its passage, and no body whatever is removed by the percussion. Supposing we had never heard of this discovery, and were at once to be told of a current of matter flying at the rate of ten millions of miles in a minute, and so large as to cover one-half of our globe, would we not imagine that the earth must instantly be torn to pieces by it, or carried off with the most incredible velocity? It will be objected, that the extreme minuteness of the particles of light prevents it from having any such effect; but as these particles are in such quantity, and so close to each other, as to cover the surface of every body that is opposed to them, and entirely to fill up that vast space betwixt the earth and the sun, this objection, I should think, in a great measure falls to the ground. The

particles of air and of water are likewise extremely minute, and a small quantity of these will produce little or no effect; but increase their number, and only give them the millionth part of the velocity that is ascribed to a ray of light, and no force whatever could be able to withstand them.

Adieu. I have unwarily run myself into the very deeps of philosophy, and find it rather difficult to struggle out again. I ask your pardon, and promise, if possible, for the future, to steer quite clear of them. I am sure, whatever this comet may be to the universe, it has been an *ignis fatuus* to me; for it has led me strangely out of my road, and bewildered me amongst rocks and quicksands where I was like to stick fifty times.

I have forgot whether or not you are a rigid Newtonian; if you are, I believe I had better recant in time for fear of accidents. I know this is a very tender point; and have seen many of those gentlemen, who are good Christians too, that can bear with much more temper to hear the divinity of our Saviour called in question than that of Sir Isaac, and look on a Cartesian or a Ptolemean as a worse species of infidel than an atheist.

I remember, when I was at college, to have seen a heretic to their doctrine of gravity very suddenly converted by being tossed in a blanket; and another, who denied the law of centripetal and centrifugal forces, soon brought to assent, from having the demonstration made upon his shoulders, by a stone whirled at the end of a string.

These are powerful arguments, and it is difficult to withstand them. I cry you mercy. I am without reach of you at present, and you are heartily welcome to wreak your vengeance on my letter.

#### CHURCHES OF PALERMO.—PREPARATIONS FOR A FESTIVAL.

*Palermo, July 6.*

MANY of the churches here are extremely rich and magnificent. The cathedral (or, as they call it, *Madre Chiesa*) is a venerable Gothic building, and of a large size; it is supported within by eighty columns of oriental granite, and divided into a great number of chapels, some of which are extremely rich, particularly that of St Rosolia, the patroness of Palermo, who is held in greater veneration here than all the persons of the Trinity, and, which is still more, than even the Virgin Mary herself. The relics of the saint are preserved in a large box of silver, curiously wrought, and enriched with precious stones. They perform many miracles, and are looked upon as the greatest treasure of the city. They are esteemed the most effectual remedy against the plague, and have often preserved them from that fatal distemper. The saint gained so much credit, in saving them from the last plague of Messina, although it was at two hundred miles' distance, that they have, out of gratitude, erected a noble monument to her. St Agatha did as much for Catania, but that city has not been so generous to her. The other riches of this church consist principally in some bones of St Peter, and a whole arm of St John the Baptist. There is likewise a jaw-bone of prodigious efficacy; and some other bones of lesser note. It contains some things of smaller consequence, which, however, are not altogether without their merit. The monuments of their Norman kings, several of whom lie buried here, are of the finest porphyry, some of them near seven hundred years old, and yet of very tolerable workmanship. Opposite to these there is a tabernacle of lapis lazuli. It is about fifteen feet high, and finely ornamented. Some of the presents made to St Rosolia are by no means contemptible. A cross of very large brilliants, from the King of Spain, is, I think, the most considerable.

The Sacristie, too, is very rich; there are some robes embroidered with oriental pearl, that are near four hundred years old, and yet look as fresh as if done yesterday.

The Jesuits' church is equal in magnificence to any thing I have seen in Italy. The genius of those fathers appears strong in all their works; one is never at a loss to find them out. They have been grossly calumniated, for they certainly had less hypocrisy than any other order of monks.

The Chiesa del Pallazzo is entirely incrusted over with ancient mosaic, and the vaulted roof, too, is all of the same. But it is endless to talk of churches. Here are upwards of three hundred. That of Monreale, about five miles distant from this city, is the next in dignity in the island after the cathedral of Palermo. It is nearly of the same size, and the whole is incrusted with mosaic, at an incredible expense. Here are likewise several porphyry and marble monuments of the first kings of Sicily. This cathedral was built by King William the Good, whose memory is still held in great veneration amongst the Sicilians.

The Archbishop of Monreale is already looked upon as a saint, and indeed he deserves beatification better, I believe, than most of those in the calendar. His income is very great, of which he reserves to himself just as much as procures him clothes and the simplest kind of food; all the rest he devotes to charitable, pious, and public uses. He even seems to carry this too far, and denies himself the most common gratifications of life—such as sleeping on a bed, a piece of luxury he is said never to indulge himself in, but lies every night on straw. He is, as you may believe, adored by the people, who crowd in his way as he passes to receive his benediction, which they allege is even of more sovereign efficacy than that of the pope. And, indeed, so it is; for he never sees an object in distress but he is sure to relieve him, not trusting alone to the spiritual efficacy of the blessing, but always accompanying it with something solid and temporal; and, perhaps, this accompaniment is not esteemed the worst part of it. The town and country round Monreale are greatly indebted to his liberality, and in every corner exhibit marks of his munificence. He has just now made a present to the cathedral of a magnificent altar, only about one-half of which is finished. It is of massive silver, exquisitely wrought, representing, in high relief, some of the principal stories in the Bible, and, I think, will be one of the finest in the world. But, what is of much greater utility, he has at his own expense made a noble walk the whole way from this city to Monreale, which was formerly of very difficult access, as it stands near the top of a pretty high mountain. The walk is cut with a great deal of judgment on the side of this mountain, and winds by easy zigzags to the top of it. It is adorned with several elegant fountains of water, and is bordered on each side with a variety of flowering shrubs. The valley at the foot of the mountain is rich and beautiful. It appears one continued orange garden for many miles, and exhibits an elegant piece of scenery; perfuming the air, at the same time, with the most delicious odours. We were so pleased with this little expedition, that notwithstanding the heat of the season, we could not keep in our carriage, but walked almost the whole road.

The city of Palermo, for these ten days past, has been wholly occupied in preparing for the great feast of St Rosalia; and if the show is in any degree adequate to the expense and trouble it costs them, it must indeed be a very noble one. They are erecting an incredible number of arches and pyramids for the illuminations. They are of wood, painted, and adorned with artificial flowers. These, they tell us, are to be entirely covered over with small lamps, so that when seen at a little distance, they appear like so many pyramids and arches of flame. The whole Marino, and the two great streets that divide the city, are to

be illuminated in this magnificent manner. The number of pyramids and arches prepared for these illuminations, we are told, exceed two thousand. They are erected on each side of the street, betwixt the footpath and the pavement, and run in two right lines exactly parallel from end to end. Each of these lines is a mile in length, which makes four miles for the whole. The four gates are the vistas to these four streets, and are to be highly decorated and illuminated. From the square in the centre of the city, the whole of this vast illumination can be seen at once; and they assure us the grandeur of it exceeds all belief. The whole of the Marino is to be dressed out in the same manner: and for these three weeks past, they have been employed in erecting two great theatres for fireworks. One of these fronts the viceroys' palace, and is almost equal to it in size; the other is laid on piles driven in the sea, exactly opposite to the great orchestra in the centre of the Marino. Besides these, they are building an enormous engine, which they call St Rosalia's triumphal car. From the size of it one would imagine it were for ever to remain on the spot where it is erected, but they assure us it is to be drawn in triumph through the city. It is indeed mounted upon wheels, but it does not appear that any force whatever can be able to turn them.

My own curiosity increases every day to see this singular exhibition. The car is already higher than most houses in Palermo, and they are still adding to its height. But the part of the show they value themselves the most on is the illumination of the great church; this they affirm is superior to any thing in the world, the illumination of St Peter's itself not excepted. The preparations for it are indeed amazing. These were begun about a month ago, and will not be finished till towards the last days of the feast. The whole of the cathedral, both roof and walls, is entirely covered over with mirrors, intermixed with gold and silver paper, and an infinite variety of artificial flowers. All these are arranged and disposed, in my opinion, with great taste and elegance; none of them predominate, but they are intermingled every where in a just proportion.

Every altar, chapel, and column, are finished in the same manner, which takes off from the littleness of the particular ornaments, and gives an air of grandeur and uniformity to the whole. The roof is hung with innumerable lustres filled with wax candles, and I am persuaded, when the whole is lighted up, it must be equal to any palace either in the *Fairy Tales* or the *Arabian Nights Entertainments*. Indeed, it seems pretty much in the same style too, for all is gold, silver, and precious stones. The saints are dressed out in all their glory, and the fairy queen herself was never finer than is St Rosalia. The people are lying yonder in crowds before her, praying with all their might. I dare say, for one petition offered to God Almighty she has at least a hundred. We were just now remarking with how little respect they pass the chapels dedicated to God; they hardly deign to give a little inclination of the head; but when they come near those of their favourite saints, they bow down to the very ground. Ignorance and superstition have ever been inseparable: I believe in their hearts they think he has already reigned long enough, and would be glad to have a change in the government; and every one of them (like the poor Welshman who thought he would be succeeded by Sir Watkin Williams) is fully persuaded that his own favourite saint is the true heir-apparent. Indeed, they already give them the precedence on most occasions—not in processions and affairs of etiquette—there they think it would not be decent; but in their more private affairs they generally pay the compliment to the saint; yet, in their inscriptions on churches and chapels (which one would think are public enough), when they are dedicated to God and any particular saint, they have often ventured to put the name of the saint first—“*Sancto*

*Januario, et Deo Opt. Max.*”—taking every opportunity of raising their dignity, though at the expense of that of God himself.

ST ROSOLIA.—SUPERSTITION AND INFIDELITY.

Palermo, July 7.

I HAVE been inquiring who this same St Rosolia may be, who has become so very capital a personage in this part of the world; but notwithstanding their adoring her with such fervency, I have found none that can give any tolerable account of her saintship. They refer you to the most fabulous legends, that even differ widely in their accounts of her. And, after all the offerings they have made, the churches they have built, and monuments they have raised to her memory, I think it is far from being improbable that there really never did exist such a person. I went through all the booksellers' shops, but could find nothing relative to her, except an epic poem, of which she is the heroine. It is in the Sicilian language, and is indeed one of the greatest curiosities I have met with. The poet sets her at once above all other saints except the Virgin, and it seems to be with the greatest reluctance that he can prevail upon himself to yield the pass even to her. I find from this curious composition, and the notes upon it, that St Rosolia was niece to King William the Good; that she began very early to display symptoms of her sanctity; that at fifteen she deserted the world and disclaimed all human society. She retired to the mountains on the west of the city, and was never more heard of for about five hundred years. She disappeared in the year 1159. The people thought she had been taken up to heaven, till, in the year 1624, during the time of a dreadful plague, a holy man had a vision that the saint's bones were lying in a cave near the top of the Monte Pellegrino; and that if they were taken up with due reverence, and carried in procession thrice round the walls of the city, they should immediately be delivered from the plague. At first little attention was paid to the holy man, and he was looked upon as little better than a dreamer; however, he persisted in his story, grew noisy, and got adherents. The magistrates, to pacify them, sent to the Monte Pellegrino, when, lo! the mighty discovery was made—the sacred bones were found—the city was freed from the plague, and St Rosolia became the greatest saint in the calendar. Churches were reared, altars were dedicated, and ministers appointed to this new divinity, whose dignity and consequence have ever since been supported at an incredible expense. Now, I think it is more than probable that these bones, that are now so much revered, and about which this great city is at present in such a bustle, belong to some poor wretch, that perhaps was murdered, or died for want in the mountains. The holy man probably could have given a very good account of them.

It is really astonishing to think what animals superstition makes of mankind. I dare say the bones of St Rosolia are just as little entitled to the honours they receive as those of poor St Viar, which were found somewhere in Spain under a broken tombstone, where these were the only legible letters. The story, I think, is told by Dr Middleton. The priests found that the bones had an excellent knack at working miracles, and were of opinion that this, together with the *S. Viar* on the stone, was proof sufficient of his sanctity. He continued long in high estimation, and they drew no inconsiderable revenue from his abilities, till unfortunately they petitioned the pope to grant him some immunities. The pope (Leo X., I think), not entirely satisfied with regard to his saintship, desired to be informed of his pretensions. A list of his miracles was sent over, accompanied by the stone with *S. Viar* upon it. The first part of the proof was sustained, but the antiquaries found the fragment to

be part of the tombstone of a (Roman) *praefectus viarum*, or overseer of the high road, to whose bones they had been so much indebted, and poor St Viar, though probably an honest man than most of them, was ordered to be struck out of the calendar.

The people of fashion here hold the superstition of the vulgar in great contempt; and perhaps that very superstition is one principal cause of their infidelity. Indeed, I have ever found that deism is most prevalent in those countries where the people are the wildest and most bigoted. A refined and cultivated understanding, shocked at their folly, thinks it cannot possibly recede too far from it, and is often tempted to fly to the very opposite extreme. When reason is much offended by any particular dogma of faith or act of worship, she is but too apt, in the midst of her disgust, to reject the whole. The great misfortune is, that in these countries, the most violent champions for religion are commonly the most weak and ignorant; and certainly one weak advocate in any cause, but more particularly in a mysterious one, that requires to be handled with delicacy and address, is capable of hurting it more than fifty of its warmest opponents. Silly books, that have been written by weak well-meaning men, in defence of religion, I am confident have made more infidels than all the works of Bolingbroke, Shaftesbury, or even Voltaire himself: they only want to make people believe that there are some ludicrous things to be said against it; but these grave plodding blockheads do all they can to persuade us that there is little or nothing to be said for it. The universal error of these gentry is, that they ever attempt to explain, and reconcile to sense and reason, those very mysteries that the first principles of our religion teach us are incomprehensible, and of consequence neither objects of sense nor reason. I once heard an ignorant priest declare that he did not find the least difficulty in conceiving the mystery of the Trinity, or that of Incarnation, and that he would undertake to make them plain to the meanest capacities. A gentleman present told him he had no doubt he could—to all such capacities as his own. The priest took it as a compliment, and made him a bow. Now, don't you think that a few such teachers as this must hurt religion more by their zeal than all its opponents can by their wit? Had these heroes still kept behind the bulwarks of faith and of mystery, their adversaries never could have touched them; but they have been foolish enough to abandon these strongholds, and dared them forth to combat on the plain fields of reason and of sense. A sad piece of generalship indeed: such defenders must ever ruin the best cause.

But although the people of education here despise the wild superstition of the vulgar, yet they go regularly to mass, and attend the ordinances with great respect and decency; and they are much pleased with us for our conformity to their customs, and for not appearing openly to despise their rites and ceremonies. I own this attention of theirs not to offend weak minds tends much to give us a favourable opinion both of their hearts and understandings. They don't make any boast of their infidelity, neither do they pester you with it as in France, where it is perpetually buzzed in your ears, and where, although they pretend to believe less, they do in fact believe more than any nation on the continent.

I know of nothing that gives one a worse opinion of a man than to see him make a show and parade of his contempt for things held sacred—it is an open insult to the judgment of the public. A countryman of ours, about two years ago, offended egregiously in this article, and the people still speak of him both with contempt and detestation. It happened one day in the great church, during the elevation of the host, when every body else were on their knees, that he still kept standing, without any appearance of respect for the ceremony. A young nobleman that was near him expressed his surprise at this. "It is strange,

sir," said he, "that you, who have had the education of a gentleman, and ought to have the sentiments of one, should choose thus to give so very public offence."

"Why, sir," said the Englishman, "I don't believe in transubstantiation." "Neither do I, sir," replied the other, "and yet you see I kneel."

Adieu. I am called away to see the preparations for the feast. In my next I shall probably give you some account of it.

P. S.—I have been watching with great care the return of our comet, but as yet I have discovered nothing of it. I observe, too, with a very indifferent glass, several large round spots on the sun's disk, and am far from being certain that it is not one of them; but I shall not alarm you any more with this subject.

#### THE SIROCCO.—FEMALE LIBERTY.

*Palermo, July 10.*

ON Sunday the 8th we had the long-expected sirocco wind, which, although our expectations had been raised pretty high, yet I own greatly exceeded them. Ever since we came to our new lodging, the thermometer has stood betwixt 72 and 74 degrees; at our old one it was often at 79 and 80; so great is the difference betwixt the heart of the city and the seashore. At present our windows not only front to the north, but the sea is immediately under them, from whence we are constantly refreshed by a delightful cooling breeze. Friday and Saturday were uncommonly cool, the mercury never being higher than 72½; and although the sirocco is said to have set in early on Sunday morning, the air in our apartments, which are very large, with high ceilings, was not in the least affected by it at eight o'clock, when I rose. I opened the door without having any suspicion of such a change, and indeed I never was more astonished in my life. The first blast of it on my face felt like the burning steam from the mouth of an oven. I drew back my head and shut the door, calling out to Fullarton that the whole atmosphere was in a flame. However, we ventured to open another door that leads to a cool platform, where we usually walk; this was not exposed to the wind; and here I found the heat much more supportable than I could have expected from the first specimen I had of it at the other door. It felt somewhat like the subterraneous sweating-stoves at Naples, but still much hotter. In a few minutes we found every fibre greatly relaxed, and the pores opened to such a degree, that we expected soon to be thrown into a profuse sweat. I went to examine the thermometer, and found the air in the room as yet so little affected that it stood only at 73. The preceding night it was at 72½. I took it out to the open air, when it immediately rose to 110, and soon after to 112; and I am confident, that in our old lodgings, or any where within the city, it must have risen several degrees higher. The air was thick and heavy, but the barometer was little affected—it had fallen only about a line. The sun did not once appear the whole day, otherwise I am persuaded the heat must have been insupportable; on that side of our platform which is exposed to the wind, it was with difficulty we could bear it for a few minutes. Here I exposed a little pomatum, which was melted down as if I had laid it before the fire. I attempted to take a walk in the street, to see if any creature was stirring, but I found it too much for me, and was glad to get up stairs again.

This extraordinary heat continued till three o'clock in the afternoon, when the wind changed at once, almost to the opposite point of the compass, and all the rest of the day it blew strong from the sea. It is impossible to conceive the different feeling of the air. Indeed, the sudden change from heat to cold is almost

as inconceivable as that from cold to heat. The current of this hot air had been flying for many hours from south to north, and I had no doubt that the atmosphere for many miles round was entirely composed of it; however, the wind no sooner changed to the north, than it felt extremely cold, and we were soon obliged to put on our clothes, for till then we had been almost naked. In a short time the thermometer sunk to 82 degrees, a degree of heat that in England would be thought almost insupportable, and yet all that night we were obliged, merely from the cold, to keep up the glasses of our coach; so much were the pores opened and the fibres relaxed by these few hours of the sirocco. Indeed, I had exposed myself a good deal to the open air, as I was determined to feel what effect it would produce on the human body. At first I thought it must have been impossible to bear it; but I soon discovered my mistake, and found, that where I was sheltered from the wind, I could walk about without any great inconvenience; neither did it produce that copious sweat I expected; it occasioned, indeed, a violent perspiration, which was only attended with slight moisture on the skin; but I suppose, if I had put on my clothes, or taken the least exercise, it soon would have brought it on.

I own to you my curiosity with regard to the sirocco is now thoroughly satisfied, nor do I at all wish for another visit of it during our stay in Sicily. Many of our acquaintance, who had been promising us this *regalo*, as they call it, came crowding about us as soon as it was over, to know what we thought of it. They own it has been pretty violent for the time it lasted, but assure us they have felt it more so, and likewise of a much longer duration; however, it seldom lasts more than thirty-six or forty hours, so that the walls of the houses have not time to be heated throughout, otherwise they think there could be no such thing as living; however, from what I have felt of it, I believe they are mistaken. Indeed, had I been satisfied with the first blast (which is generally the case with them), and never more ventured out in it, I certainly should have been of their opinion. They laughed at us for exposing ourselves so long to it, and were surprised that our curiosity should lead us to make experiments at the expense of our persons. They assure us that during the time it lasts, there is not a mortal to be seen without doors, but those whom necessity obliges. All their doors and windows are shut close, to prevent the external air from entering, and where there are no window-shutters, they hang up wet blankets on the inside of the window. The servants are constantly employed in sprinkling water through their apartments, to preserve the air in as temperate a state as possible; and this is no difficult matter here, as I am told there is not a house in the city that has not a fountain within it. By these means, the people of fashion suffer very little from the sirocco, except the strict confinement to which it restricts them.

It is somewhat singular, that notwithstanding the scorching heat of this wind, it has never been known to produce any epidemical distempers, nor, indeed, bad consequences of any kind to the health of the people. It is true, they feel extremely weak and relaxed during the time it blows, but a few hours of the tramontane, or north wind, which generally succeeds it, soon braces them up and sets them to rights again. Now, in Naples and in many other places in Italy, where its violence is not to be compared to this, it is often attended with putrid disorders, and seldom fails to produce an almost general dejection of spirits. It is true, indeed, that there the sirocco lasts for many days, nay, even for weeks; so that, as its effects are different, it probably proceeds, likewise, from a different cause.

I have not been able to procure any good account of this very singular object in the climate of Palermo. The causes they assign for it are various, though none of them, I think, are altogether satisfactory.

Some of the families here put me in mind of my own domestic system. The Prince of Resuttana, his wife and daughter, are always together, but it is because they choose to be so, and there appears the strongest affection, without the least diffidence on the one side or restraint on the other. The young princess Donda Rosolia is one of the most amiable young ladies I have seen; she was of our little party last night, and indeed made one of its greatest ornaments. It would appear vain and partial after this to say, that in countenance, sentiment, and behaviour, she seems altogether English, but it is true; and this perhaps may have contributed to advance her still higher in our esteem; for in spite of all our philosophy, these unphilosophical prejudices will still exist, and no man, I believe, has entirely divested himself of them. We had lately a noble entertainment at her father's country-house, and had reason to be much pleased with the unaffected hospitality and easy politeness of the whole family. This palace is reckoned the most magnificent in the neighbourhood of Palermo. It lies about six or seven miles to the west of the city, in the country called Il Colle, in the opposite direction from the Bagaria, which I have already mentioned. The viceroy and his family, with the greater part of the nobility, were of this party, which lasted till about two in the morning. At midnight a curious set of fireworks was played off from the leads of the palace, which had a fine effect from the garden below.

Farewell. I had no time to write yesterday, and though we did not break up till near three this morning, I have got up at eight, I was so eager to give you some account of the sirocco wind.

We are now going to be very busy; the feast of St Rosolia begins to-morrow, and all the world are on the very tiptoe of expectation; perhaps they may be disappointed. I often wish that you were with us, particularly when we are happy, though you know it is by no means feasts and shows that make us so. However, as this is perhaps the most remarkable one in Europe, that you may enjoy as much of it as possible, I shall sit down every night and give you a short account of the transactions of the day. We are now going to breakfast, after which we are engaged to play at ballon, an exercise I suppose you are well acquainted with; but as the day promises to be extremely hot, I believe I shall desert the party and go a-swimming. But I see F. and G. have already attacked the figs and peaches, so I must appear for my interest. Farewell.

#### FESTIVAL OF ST ROSOLIA.

*Palermo, July 12.*

ABOUT five in the afternoon, the festival began by the triumph of St Rosolia, who was drawn with great pomp through the centre of the city, from the Marino to the Porto Nuovo. The triumphal car was preceded by a troop of horse, with trumpets and kettle-drums, and all the city officers in their gala uniforms. It is indeed a most enormous machine; it measures seventy feet long, thirty wide, and upwards of eighty high, and, as it passed along, overtopped the loftiest houses of Palermo. The form of its under part is like that of the Roman galleys, but it swells as it advances in height, and the front assumes an oval shape like an amphitheatre, with seats placed in the theatrical manner. This is the great orchestra, which was filled with a numerous band of musicians placed in rows, one above the other: over this orchestra, and a little behind it, there is a large dome supported by six Corinthian columns, and adorned with a number of figures of saints and angels; and on the summit of the dome there is a gigantic silver statue of St Rosolia. The whole machine is dressed out with orange-trees, flower-pots, and trees of artificial coral. The car stopped every fifty

or sixty yards, when the orchestra performed a piece of music, with songs in honour of the saint. It appeared a moving castle, and completely filled the great street from side to side. This indeed was its greatest disadvantage, for the space it had to move in was in no wise proportioned to its size, and the houses seemed to dwindle away to nothing as it passed along. This vast fabric was drawn by fifty-six huge mules, in two rows, curiously caparisoned, and mounted by twenty-eight postilions, dressed in gold and silver stuffs, with great plumes of ostrich feathers in their hats. Every window and balcony, on both sides of the street, were full of well-dressed people, and the car was followed by many thousands of the lower sort. The triumph was finished in about three hours, and was succeeded by the beautiful illumination of the Marino.

I believe I have already mentioned that there is a range of arches and pyramids extending from end to end of this noble walk; these are painted, and adorned with artificial flowers, and are entirely covered with lamps, placed so very thick that, at a little distance, the whole appears so many pyramids and arches of flame. The whole chain of this illumination was about a mile in length, and indeed you can hardly conceive any thing more splendid. There was no break or imperfection any where, the night being so still that not a single lamp was extinguished.

Opposite to the centre of this great line of light, there was a magnificent pavilion erected for the viceroy and his company, which consisted of the whole nobility of Palermo; and on the front of this, at some little distance in the sea, stood the great fire-works, representing the front of a palace, adorned with columns, arches, trophies, and every ornament of architecture. All the chebecks, galleys, galliots, and other shipping, were ranged around this palace, and formed a kind of amphitheatre in the sea, enclosing it in the centre. These began the show by a discharge of the whole of their artillery, the sound of which, re-echoed from the mountains, produced a very noble effect; they then played off a variety of water-rockets, and bombs of a curious construction, that often burst below water. This continued for half an hour, when, in an instant, the whole of the palace was beautifully illuminated. This was the signal for the shipping to cease, and appeared indeed like a piece of enchantment, as it was done altogether instantaneously, and without the appearance of any agent. At the same time the fountains that were represented in the court before the palace began to spout up fire, and made a representation of some of the great jets d'eau of Versailles and Marly. As soon as these were extinguished, the court assumed the form of a great parterre, adorned with a variety of palm-trees of fire, interspersed with orange-trees, flower-pots, vases, and other ornaments. On the extinguishing of these, the illumination of the palace was likewise extinguished, and the front of it broke out into the appearance of a variety of suns, stars, and wheels of fire, which in a short time reduced it to a perfect ruin. And when all appeared finished, there burst from the centre of the pile a vast explosion of two thousand rockets, bombs, serpents, squibs, and devils, which seemed to fill the whole atmosphere: the fall of these made terrible havoc amongst the clothes of the poor people who were not under cover, but afforded admirable entertainment to the nobility who were. During this exhibition we had a handsome entertainment of coffee, ices, and sweetmeats, with a variety of excellent wines, in the great pavilion in the centre of the Marino; this was at the expense of the Duke of Castellano, the prætor (or mayor) of the city. The principal nobility give these entertainments by turns every night during the festival, and vie with each other in their magnificence.

As soon as the fire-works were finished, the viceroy went out to sea in a galley richly illuminated. We chose to stay on shore, to see the appearance it made at a distance. It was rowed by seventy-two oars, and

indeed made one of the most beautiful objects you can imagine—flying with vast velocity over the waters, as smooth and as clear as glass, which shone round it like a flame, and reflected its splendour on all sides. The oars beat time to the French horns, clarionets, and trumpets, of which there was a numerous band on the prow.

The day's entertainment was concluded by the Corso, which began exactly at midnight, and lasted till two in the morning.

The great street was illuminated in the same magnificent manner as the Marino. The arches and pyramids were erected at little distances from each other, on both sides of the street, betwixt the footpath and the space for carriages, and when seen from either of the gates, appeared to be two continued lines of the brightest flame. Indeed these illuminations are so very different, and so much superior, to any I have ever seen, that I find it difficult to give any tolerable idea of them. Two lines of coaches occupied the space betwixt these two lines of illumination. They were in the greatest gala; and as they open from the middle, and let down on each side, the beauty of the ladies, the richness of their dress, and the brilliancy of their jewels, were displayed in the most advantageous manner.

This beautiful train moved slowly round and round for the space of two hours; and every member of it seemed animated with a desire to please. The company appeared all joy and exultation: scarce two coaches passed without some mutual acknowledgment of affection or respect; and the pleasure that sparkled from every eye seemed to be reflected and communicated by a kind of sympathy through the whole.

In such an assembly, it was impossible for the heart not to dilate and expand itself: I own mine was often so full that I could hardly find utterance; and I have seen a tragedy with less emotion than I did this scene of joy. I always thought these affections had been strangers to pomp and parade; but here the universal joy seemed really to spring from the heart—it brightened up every countenance, and spoke affection and friendship from every face. No stately air—no supercilious look; all appeared friends and equals. And sure I am that the beauty of the ladies was not half so much heightened, either by their dress or their jewels, as by that air of complacency and good humour with which it was animated.

We were distributed in different coaches amongst the nobility, which gave us a better opportunity of making these observations. I will own to you that I have never beheld a more delightful sight; and if superstition often produces such effects, I sincerely wish we had a little more of it amongst us. I could have thrown myself down before St Rosalia, and blessed her for making so many people happy.

We retired about two o'clock; but the variety of glittering scenes and gaudy objects still vibrated before my eyes, and prevented me from sleeping: however, I am almost as much refreshed as if I had; but I really believe four more such days will be too much for any of us. Indeed, I am sure that it is impossible to keep it up, and it must necessarily flag. I think, from what I can observe, they have already exhausted almost one-half of their preparations; how they are to support the other four days, I own I do not comprehend: however, we shall see.

I thought to have given you an account of every thing at night after it was over, but I find it impossible: the spirits are too much dissipated and exhausted, and the imagination is too full of objects, to be able to separate them with any degree of regularity. I shall write you, therefore, regularly the morning following, when this fever of the fancy has had time to cool, and when things appear as they really are. Adieu, then, till to-morrow. Here is a fine shower, which will cool the air, and save the trouble of watering the Marino and the great street, which is done

regularly every morning when there is no rain. The thermometer is at 73 degrees.

13th.—I thought there would be a falling-off. Yesterday's entertainments were not so splendid as those of the day before. They began by the horse races. There were three races, and six horses started each race. These were mounted by boys of about twelve years old, without either saddle or bridle, but only a small piece of cord, by way of bit, in the horse's mouth, which, it seems, is sufficient to stop them. The great street was the course; and to this end it was covered with earth to the depth of five or six inches. The firing of a cannon at the Porto Felice was the signal for starting; and the horses seemed to understand this, for they all set off at once, full speed, and continued at their utmost stretch to the Porto Nuovo, which was the winning-post. It is exactly a mile, and they performed it in a minute and thirty-five seconds, which, considering the size of the horses (scarce fourteen hands), we thought was very great. These are generally barbs, or a mixed breed betwixt the Sicilian and barb. The boys were gaudily dressed, and made a pretty appearance. We were surprised to see how well they stuck on; however, I observed they had generally laid fast hold of the mane.

The moment before starting the street appeared full of people; nor did we conceive how the race could possibly be performed. Our surprise was increased when we saw the horses run full speed at the very thickest of this crowd, which did not begin to open till they were almost close upon it. The people then opened, and fell back on each side, by a regular uniform motion, from one end of the street to the other. This singular manœuvre seemed to be performed without any bustle or confusion, and the moment the horses were past they closed again behind them. However, it destroys great part of the pleasure of the race; for you cannot help being under apprehensions for such a number of people, whom you every moment see in imminent danger of being trodden to death; for this must inevitably be their fate, were they only a second or two later in retiring. These accidents, they allow, have often happened: however, yesterday every body escaped.

The victor was conducted along the street in triumph, with his prize displayed before him. This was a piece of white silk, embroidered and worked with gold.

These races, I think, are much superior to the common style of races in Italy, which are performed by horses alone without riders; but they are by no means to be compared to those in England.

The great street was illuminated in the same manner as on the preceding night, and the grand conversation of the nobles was held at the archbishop's palace, which was richly fitted up for the occasion.

The gardens were finely illuminated, and put me in mind of our Vauxhall. There were two orchestras (one at each end), and two very good bands of music. The entertainment was splendid, and the archbishop showed attention and politeness to every person of the company.

About ten o'clock the great triumphal car marched back again in procession to the Marino. It was richly illuminated with large wax tapers, and made a most formidable figure. Don Quixote would have been very excusable in taking it for an enchanted castle, moving through the air. We did not leave the archbishop's till midnight, when the Corso began, which was precisely the same in every respect as the night before, and afforded us a delightful scene.

14th.—Last night the two great streets, and the four gates of the city that terminate them, were illuminated in the most splendid manner. These streets cross each other in the centre of the city, where they form a beautiful square, called *La Piazza Ottangolare*, from the eight angles they form. This square was richly ornamented with tapestry, statues, and artificial

flowers; and as the buildings which form its four sides are uniform and of a beautiful architecture, and at the same time highly illuminated, it made a fine appearance. There are four orchestras erected in it: and the four bands of music are greater than I had any conception this city could have produced.

From the centre of this square you have a view of the whole city of Palermo thus dressed out in its glory, and, indeed, the effect it produces surpasses belief. The four gates that form the vistas to this splendid scene are highly decorated, and lighted up in an elegant taste—the illuminations representing a variety of trophies, the arms of Spain, those of Naples, Sicily, and the city of Palermo, with their guardian geniuses, &c.

The conversation of the nobles was held in the viceroy's palace, and the entertainment was still more magnificent than any of the former. The great fireworks opposite to the front of the palace began at ten o'clock and ended at midnight, after which we went to the Corso, which lasted, as usual, till two in the morning. This part of the entertainment still pleases us the most; it is indeed the only part of it that reaches the heart; and where this is not the case, a puppet-show is just as good as a coronation. We have now got acquainted almost with every countenance; and from that air of goodness and benignity that animates them, and which seems to be mutually reflected from one to the other, we are inclined to form the most favourable opinion of the people.

Our fire-works last night were greater than those of the Marino, but their effect did not please me so much; the want of the sea and the shipping were two capital defects. They likewise represented the front of a palace, but of a greater extent. It was illuminated, too, as the former, and the whole conducted pretty much in the same manner. We saw it to the greatest advantage from the balconies of the state apartments in the viceroy's palace, where we had an elegant concert, but, to the no small disappointment of the company, Gabrieli, the finest singer, but the most capricious mortal upon earth, did not choose to perform.

15th.—Three races, six horses each as formerly. They called it very good sport. I cannot say that I admired it. A poor creature was rode down, and I believe killed, and one of the boys had likewise a fall.

The great assembly of the nobility was held at the Judice Monarchia's, an officer of high trust and dignity. Here we had an entertainment in the same style as the others, and a good concert. At eleven o'clock the viceroy, attended by the whole company, went on foot to visit the square and the great church. We made a prodigious train; for though the city was all a lamp of light, the servants of the viceroy and nobility attended with wax flambeaux to show us the way. As soon as the viceroy entered the square, the four orchestras struck up a symphony, and continued playing till he left it.

The crowd around the church was very great, and without the presence of the viceroy it would have been impossible for us to get in; but his attendants soon cleared the passages, and at once entering the great gate, we beheld the most splendid scene in the world. The whole church appeared a flame of light, which, reflected from ten thousand bright and shining surfaces, of different colours, and at different angles, produced an effect, which, I think, exceeds all the descriptions of enchantment I ever read. Indeed, I did not think that human art could have devised any thing so splendid. I believe I have already mentioned that the whole church—walls, roof, pillars, and pilasters—were entirely covered over with mirrors, interspersed with gold and silver paper, artificial flowers, &c., done up with great taste and elegance, so that not one inch either of stone or plaster was to be seen. Now, form an idea, if you can, of one of our great cathedrals

dressed out in this manner, and illuminated with twenty thousand wax tapers, and you will have some faint notion of this splendid scene. I own it did greatly exceed my expectations, although, from the descriptions we had of it, they were raised very high. When we recovered from our first surprise, which had produced, unknown to ourselves, many exclamations of astonishment, I observed that all the eyes of the nobility were fixed upon us, and that they enjoyed exceedingly the amazement into which we were thrown. Indeed, this scene, in my opinion, greatly exceeds all the rest of the show.

I have often heard the illumination of St Peter's spoken of as a wonderfully fine thing: so indeed it is; but it is certainly no more to be compared to this, than the planet Venus is to the sun. The effects, indeed, are of a different kind, and cannot well be compared together.

This scene was too glaring to bear any considerable time, and the heat occasioned by the immense number of lights soon became intolerable. I attempted to reckon the number of lustres, and counted upwards of five hundred; but my head became giddy, and I was obliged to give it up. They assure us that the number of wax tapers is not less than twenty thousand. There are eight and twenty altars, fourteen on each side; these are dressed out with the utmost magnificence, and the great altar is by far the most splendid of all.

When you think of the gaudy materials that compose the lining of this church, it will be difficult to annex an idea of grandeur and majesty to it—at least so it struck me when I was first told of it—yet, I assure you, the elegant simplicity and unity of the design prevents this effect, and gives an air of dignity to the whole.

It is on this part of the show the people of Palermo value themselves the most; they talk of all the rest as trifling in comparison of this; and, indeed, I think it is probable that there is nothing of the kind in the world that is equal to it. It is strange they should choose to be at so great an expense and trouble for a show of a few hours only; for they have already begun this morning to strip the church of its gaudy dress, and I am told it will not be finished for many weeks.

From the church we went immediately to the Corso, which concluded, as usual, the entertainments of the day.

16th.—Last night we had the full illumination of all the streets. The assembly was held at the prætor's, where there was an elegant entertainment and a concert. Pacherotti, the first man of the opera, distinguished himself very much. I think he is one of the most agreeable singers I ever heard, and am persuaded that in a few years he will be very celebrated. Campanucci, the second soprano, is, I think, preferable to most that I have heard in Italy; and you will the more easily believe this, when I inform you that he is engaged for next winter to be the first singer in the great opera at Rome. Is it not strange that the capital of all Italy, and, for the fine arts (as it formerly was for arms), the capital of the world, should condescend to choose its first opera performer from amongst the subalterns of a remote Sicilian stage?

You will believe, that with two such sopranos as these, and Gabrieli for the first woman, the opera here will not be a despicable one. It is to begin in a few days, notwithstanding the extreme heat of the season, so fond are the people here of these entertainments.

Their opera-dancers are those you had last year at London; they are just arrived, and the people are by no means pleased with them. We saw them this morning at the rehearsal, and, to their great surprise, addressed them in English. You cannot imagine how happy they were to see us. Poor souls! I was de-

lighted to hear with what warmth of gratitude and affection they spoke of England. There is a mother and two daughters; the youngest pretty, but the eldest, the first dancer, appears a sensible, modest well-behaved girl—more so than is common with these sort of people. Speaking of England, she said, with a degree of warmth that her good treatment in general could hardly inspire, that in her life she never left any country with so sore a heart; and had she only enjoyed her health, all the world should never have torn her away from it. She seemed affected when she said this. I acknowledged the honour she did the English nation, but alleged that these sentiments, and the manner in which they were uttered, could scarcely proceed from a *general love* of the country. She answered me with a smile, but at the same time I could observe the tear in her eye. At that instant we were interrupted; however, I shall endeavour, if possible, to learn her story, for I am persuaded there is one; perhaps you may know it, as I dare say it is no secret in London.

But I have got quite away from my subject, and had forgot that I sat down to give you an account of the feast. Indeed, I will own, it is a kind of subject I by no means like to write upon; I almost repent that I had undertaken it, and am heartily glad it is now over. It does very well to see shows; but their description is, of all things on earth, the most insipid—for words and writing convey ideas only by a slow and regular kind of progress—and while we gain one, we generally lose another, so that the fancy seldom embraces the whole; but when a thousand objects strike you at once, the imagination is filled and satisfied.

The great procession, that closes the festival, began at ten o'clock. It only differed from other processions in this, that besides all the priests, friars, and religious orders of the city, there were placed, at equal distances from each other, ten lofty machines made of wood and pasteboard, ornamented in an elegant manner, representing temples, tabernacles, and a variety of beautiful pieces of architecture. These are furnished by the different convents and religious fraternities, who vie with each other in the richness and elegance of the work. Some of them are not less than sixty feet high. They are filled with figures of saints and angels, made of wax, so natural, and so admirably well painted, that many of them seemed really to be alive. All these figures are prepared by the nuns, and by them dressed out in rich robes of gold and silver tissue.

We were a good deal amused this morning to see them returning home in coaches to their respective nurseries. At first we took them for ladies in their gala dress, going out to visit the churches, which we were told was the custom, and began to pull off our hats as they went past. Indeed, we were led into this blunder by some of our friends, who carried us out on purpose; and as they saw the coaches approach, told us this is the princess of such a thing—there is the duchess of such another thing; and, in short, we had made half-a-dozen of our best bows (to the no small entertainment of these wags) before we discovered the trick. They now insist upon it that we are good Catholics, for all this morning we had been bowing to saints and angels.

A great silver box, containing the bones of St Rosalia, closed the procession. It was carried by thirty-six of the most respectable burgesses of the city, who look upon this as the greatest honour. The archbishop walked behind it, giving his benedictions to the people as he passed.

No sooner had the procession finished the tour of the great square before the prator's palace, than the fountain in the centre, one of the largest and finest in Europe, was converted into a fountain of fire; throwing it up on all sides, and making a beautiful appearance. It only lasted for a few minutes, and was extinguished by a vast explosion, which concluded the

whole. As this was altogether unexpected, it produced a fine effect, and surprised the spectators more than any of the great fire-works had done.

A mutual and friendly congratulation ran through the whole assembly, which soon after parted, and this morning every thing has once more reassumed its natural form and order; and I assure you, we were not more happy at the opening of the festival, than we are now at its conclusion. Every body was fatigued and exhausted by the perpetual feasting, watching, and dissipation of these five days. However, upon the whole, we have been much delighted with it, and may with truth pronounce, that the entertainments of the feast of St Rosalia are much beyond those of the holy week at Rome, of the Ascension at Venice, or indeed any other festival we have ever witnessed.

I believe I did not tell you, that about ten or twelve days ago, as the time we had appointed for our return to Naples was elapsed, we had hired a small vessel and provided every thing for our departure; we had even taken leave of the viceroys, and received our passports. Our baggage and sea-store was already on board, when we were set upon by our friends, and solicited with so much earnestness and cordiality to give them another fortnight, that we found it impossible to refuse it; and in consequence discharged our vessel, and sent for our trunks. I should not have mentioned this, were it not to show you how much more attention is paid to strangers here than in most places on the continent.

We reckon ourselves much indebted to them for having obliged us to prolong our stay, as, independent of the amusements of the festival, we have met with so much hospitality and urbanity, that it is now with the most sincere regret we find ourselves obliged to leave them. Indeed, had we brought our clothes and books from Naples, it is hard to say how long we might have stayed.

We have sent to engage a vessel, but probably shall not sail for five or six days. Adieu.

#### ANTIQUITIES OF SICILY.

*Palermo, July 19.*

WE have now had time to inquire a little into some of the antiquities of this island, and have found several people, particularly the Prince of Torremuzzo, who have made this the chief object of their study. However, I find we must wade through oceans of fiction before we can arrive at any thing certain or satisfactory.

Most of the Sicilian authors agree in deriving their origin from Ham, or, as they call him, Cham, the son of Noah, who, they pretend, is the same as Saturn. They tell you that he built a great city, which from him was named Camesena. There have been violent disputes about the situation of this city: Berosus supposes it to have stood where Camarina was afterwards founded, and that this was only a corruption of its primitive name. But Guarneri, Carrera, and others, combat this opinion, and affirm that Camesna stood near the foot of *Ætna*, between *Acì* and *Catania*, almost opposite to those three rocks that still bear the name of the Cyclops. Indeed, Carrera mentions an inscription that he had seen in a ruin near *Acì*, supposed to have been the sepulchre of *Acis*, which he thinks puts this matter out of doubt. These are his words: "Hæc est inscriptio vetustæ ejusdam tabellæ repertæ in pyramide sepulchri *Acis*," ex frag-

\* [Translated thus:—This is the inscription upon a certain ancient tablet found in the pyramid of the tomb of *Acis*, amongst the ruins of the very ancient city of *Camesena*, now *Acì*, which was founded by *Cham*, King of the Giants, also called *Saturn Chamesenus*, on the *Xiphonian* promontory, where to this day are to be seen, levelled with the ground, ancient monuments, and the ruins of the said city and of a castle upon an isle near the rocks of the Cyclops, retaining the shortened name of *La Gazzena*.]

mentis vetustissimæ Chamesenæ, urbis hodie Acis, conditæ a Cham, gigantum principe, etiam nuncupato Saturno Chameseno, in promontorio Xiphonio, ubi adhuc hodie visuntur solo æquata antiqua vestigia, et ruinæ dictæ urbis et arcis in insula prope Scopulos Cycloppum, et retinet adhuc sinecopatum nomen La Gazzena."

This same Cham, they tell you, was a very great scoundrel, and that *esemus*, which signified infamous, was added to his name, only to denote his character. Fazzello says he married his own sister, who was called Rhea; that Ceres was the fruit of this marriage; that she did not inherit the vices of her father, but reigned over Sicily with great wisdom and moderation; that she taught her subjects the method of making bread and wine, the materials for which their island produced spontaneously in great abundance: that her daughter Proserpine was of equal beauty and virtue with herself; that Orius, King of Epirus, had demanded her in marriage, and, on a refusal, had carried her off by force; which gave occasion to the wild imagination of Greece to invent the fable of the rape of Proserpine by Pluto, king of hell, this Orius being of a morose and gloomy disposition.

Ceres has ever been the favourite deity of the Sicilians. She chose her seat of empire in the centre of the island, on the top of a high hill, called Enna, where she founded the city of that name. It is still a considerable place, and is now called Castragiovanni, but little or nothing remains of the ruins of Enna.

Cicero gives a particular account of this place. He says, in his situation in the centre of the island, it was called *Umbilicus Sicilie*, and describes it as one of the most beautiful and fertile spots in the world. The temple of Ceres at Enna was renowned all over the heathen world, and pilgrimages were made to it, as they are at present to Loretto. Fazzello says it was held in such veneration, that when the city was surprised and pillaged by the slaves and barbarians, they did not presume to touch this sacred temple, although it contained more riches than all the city besides.

There have been violent disputes amongst the Sicilian authors, whether Proserpine was carried off near the city of Enna, or that of *Ætna*, which stood at the foot of that mountain; but it is of mighty little consequence, and more respect, I think, is to be paid to the sentiments of Cicero, who gives it in favour of Enna, than the whole of them. Diodorus, too, is of the same opinion, and his description of this place is almost in the same words as that of Cicero. They both paint it as a perfect paradise, abounding in beautiful groves, clear springs and rivulets, and, like *Ætna*, covered with a variety of flowers at all seasons of the year. To these authorities, if you please, you may add that of Milton, who compares it to paradise itself:—

Nor that fair field  
Of Enna, where Proserpine gathering flowers,  
Herself a fairer flower, by gloomy Dis  
Was gathered.

If you want to have a fuller account of this place, you will find it in Cicero's pleadings against Verres, and in the fifth book of Diodorus. I have conversed with several gentlemen who have been there: they assure me that it still answers in a great measure to the description of these authors. Medals, I am told, are still found, with an elegant figure of Ceres, and an ear of wheat for the reverse; but I have not been able to procure any of them.

There was another temple in Sicily not less celebrated than this one of Ceres. It was dedicated to Venus *Erečina*, and like the other, too, was built on the summit of a high mountain. The ancient name of this mountain was Eryx, or, as the Sicilians call it, Erice, but it is now called St Juliano. Both mountain and temple are often mentioned by the Greek and Latin historians, and happily the Sicilian ones have

no dispute about its situation or origin, which they make out to be almost as ancient as that of Ceres. Diodorus says that Dedalus, after his flight from Crete, was hospitably received here, and by his wonderful skill in architecture added greatly to the beauty of this temple. He enriched it with many fine pieces of sculpture, but particularly with the figure of a ram of such exquisite workmanship that it appeared to be alive. This, I think, is likewise mentioned by Cicero.

*Æneas*, too, in his voyage from Troy to Italy, landed in this part of the island, and, according to Diodorus and Thucydides, made rich presents to this temple; but Virgil is not satisfied with this—he must raise the piety of his hero still higher, and, in opposition to all the historians, makes *Æneas* the founder of the temple.\* Its fame and glory continued to increase for many ages; and it was held in still greater veneration by the Romans than it had been by the Greeks. Fazzello says, and quotes the authority of Strabo, that seventeen cities of Sicily were laid under tribute to raise a sufficient revenue to support the dignity and enormous expenses of this temple. Two hundred soldiers were appointed for its guard, and the number of its priests, priestesses, and ministers, male and female, was incredible.

Venus succeeded in her possession of Eryx by St Juliano, who now gives his name both to the city and mountain; and indeed he has a very good title, for when the place was closely besieged, the Sicilians tell you he appeared on the walls armed cap-a-pie, and frightened the enemy to such a degree that they instantly took to their heels, and left him ever since in quiet possession of it.

Many medals are found in the neighbourhood, but there is not the least vestige of this celebrated temple. Some marbles with inscriptions and engravings, that have been found deep below ground, are almost the only remaining monuments of its existence. Suetonius says, that it had even fallen to ruins before the time of Tiberius, but as Venus was the favourite divinity of that emperor, he had ordered it to be magnificently repaired. However, it is somewhat difficult to reconcile this with Strabo's account, who tells us that even before his time it had been totally abandoned; and indeed this seems most probable, as every vestige of it has now disappeared, which is not commonly the case with the great works of the age of Tiberius.

*Æneas* landed at the port of Drepanum, at the foot of this mountain. Here he lost his father Anchises, in honour of whom, on his return from Carthage about a year after, he celebrated the games that make so great a figure in the *Æneid*, which Virgil introduces with a good deal of address as a compliment to the piety of Augustus, who had instituted games of the same kind in honour of Julius Cæsar, his father by adoption.

It is singular that Virgil's account of this part of Sicily should be so very different from that of Homer, when there was so short a space, only a few months, between the times that their two heroes visited it. Indeed, Virgil seems to have followed the historians in his conduct of this part of his poem, more than the sentiments of Homer, who makes this very country where *Æneas* was so hospitably received the habitation of Polyphemus and the Cyclops, where Ulysses lost so many of his companions, and himself made so very narrow an escape. The island of Licosia, where he moored his fleet, lay very near the port of Drepanum, and Homer describes the adventure of Polyphemus to have happened on the shore of Sicily opposite

\* Tum vicina astris Erycino in vertice sede.  
Fundatur Veneri Idaliæ tumuloque sacerdos,  
Et lucus late sacæ additur Anchisæo.  
[Then on the top of Eryx, they begin  
A rising temple to the Paphian queen.  
Anchises last is honour'd as a god:  
A priest is added, annual gifts bestow'd,  
And groves are planted round his blest abode.]

to that island. Virgil has taken the liberty to change the scene of action, as he was better acquainted both with the geography and history of the country than Homer, and, perhaps with a good deal of propriety, places it at the foot of Mount Ætna. I am afraid there is not so much propriety in his changing the action itself, and contradicting the account that Homer gives of it. For Ulysses says that Polyphemus devoured four of his companions, but that he, by his address, saved all the rest, and was himself the last that escaped out of the cave. Now, Virgil makes Ulysses to have told a lie, for he affirms that he left Achemenides behind him; and Achemenides, too, gives a different account of this affair from Ulysses: he assures Æneas that Polyphemus devoured only two of his companions, after which they put out his eye with a sharp weapon (*acuto telo*), which rather gives the idea of a spear or javelin than that of a great beam of wood made red hot in the fire, as Homer describes it. But there are many such passages. Don't you think they seem either to indicate a negligence in Virgil, or a want of deference for his master?—neither of which, I believe, he has ever been accused of.

The Sicilian authors are by no means pleased with Virgil for making Æneas the founder of this temple of Venus Erecina. They will only allow that the colony which he was obliged to leave there, after the burning of his ships, did, in honour of his mother Venus, build the city of Eryx around her temple; but they all insist upon it that the temple was built by Eryx, or, as they call him, Erice, another son of Venus, but much older than Æneas—the same that was found to be so equal a match for Hercules, but was at last killed by him, at a boxing-match near the foot of this mountain. The spot where this is supposed to have happened still retains the name of (*Il campo di Hercole*) the field of Hercules. Through the whole fifth book of the Æneid, this Eryx is styled the brother of Æneas; and, in his account of the games, Virgil introduces those very gauntlets with which he fought with Hercules (*in hoc ipso littore*) in this very field; the sight of which, from their enormous size, astonishes the whole host, and frightens the champion Dares so much that he refuses to fight.

Adieu. The opera begins in two days; after which, I think, we shall soon take leave of Sicily. Ever yours.

#### ST ROSOLIA'S CAVE.—ANTIQUITIES CONTINUED.

Palermo, July 21.

YESTERDAY we walked up to the Monte Pellegrino to pay our respects to St Rosolia, and thank her for the variety of entertainment she has afforded us. It is one of the most fatiguing expeditions I ever made in my life. The mountain is extremely high, and so uncommonly steep, that the road up to it is very properly termed *la Scala*, or the Stair. Before the discovery of St Rosolia, it was looked upon as almost inaccessible; but they have now, at a vast expense, cut out a road over precipices that were almost perpendicular. We found the saint lying in her grotto, in the very same attitude in which she is said to have been discovered: her head reclining gently upon her hand, and a crucifix before her. This is a statue of the finest white marble, and of most exquisite workmanship. It is placed in the inner part of the cavern, on the very same spot where St Rosolia expired. It is the figure of a lovely young girl of about fifteen, in an act of devotion. The artist has found means to throw something that is extremely touching into the countenance and air of this beautiful statue. I never in my life saw one that affected me so much, and am not surprised that it should have captivated the hearts of the people. It is covered with a robe of beaten gold, and is adorned with some valuable jewels. The

cave is of a considerable extent, and extremely damp, so that the poor little saint must have had very cold uncomfortable quarters. They have built a church around it, and appointed priests to watch over these precious relics, and receive the offerings of pilgrims that visit them.

An inscription, graven by the hand of St Rosolia herself, was found in a cave in Monte Quesquina, at a considerable distance from this mountain. It is said that she was disturbed in her retreat there, and had wandered from thence to Monte Pellegrino, as a more retired and inaccessible place. I shall copy it exactly as it is preserved in the poor little saint's own Latin.

EGO ROSOLIA  
SINIBALDI QUISQUINE  
ET ROSARUM DOMINI FILIA,  
AMORE DEI MEI JESU CHRISTI,  
IN HOC ANTRO HABITARI  
DECREVI.\*

After St Rosolia was scared from the cave where this inscription was found, she was never more heard of, till her bones were found about five hundred years after, in this spot.

The prospect from the top of Monte Pellegrino is beautiful and extensive. Most of the Lipari islands are discovered in a very clear day, and likewise a large portion of Mount Ætna, although at the distance of almost the whole length of Sicily. The Bagaria, too, and the Colle, covered over with a number of fine country houses and gardens, make a beautiful appearance. The city of Palermo stands within less than two miles of the foot of the mountain, and is seen to great advantage. Many people went to this mountain during the time of the great illumination, from whence they pretend it has a fine effect; but this unfortunately we neglected.

Near the middle of the mountain, and not far from its summit, there still appear some remains of a celebrated castle, the origin of which the Sicilian authors carry back to the most remote antiquity. Massa says, it is supposed to have been built in the reign of Saturn, immediately after the Flood: for in the time of the earliest Carthaginian wars, it was always much respected on account of its venerable antiquity. It was then a place of strength, and is often mentioned by the Greek historians. Diodorus says, in his twenty-third book, that Hamilcar kept possession of it for three years against all the power of the Romans, who, with an army of forty thousand men, attempted in vain to dislodge him.

The situation of Palermo is seen, I think, to more advantage from the Monte Pellegrino than from any where else. This beautiful city stands near the extremity of a kind of natural amphitheatre, formed by high and rocky mountains; but the country that lies betwixt the city and these mountains is one of the richest and most beautiful spots in the world. The whole appears a magnificent garden, filled with fruit trees of every species, and watered by clear fountains and rivulets that form a variety of windings through this delightful plain. From the singularity of this situation, as well as from the richness of the soil, Palermo has had many flattering epithets bestowed upon it, particularly by the poets, who have denominated it *Conca d'Oro*, the Golden Shell, which is at once expressive both of its situation and richness. It has likewise been styled *Aurea Valle*, *Hortus Sicilia*, &c.; and to include all these together, the lasting term of *Feliz* has been added to its name, by which you will find it distinguished even in the maps.

Many of the etymologists allege that it is from the richness of this valley that it had its original name of *Panormus*, which, in the old Greek language, they pretend, signified *All a garden*; but others say there

\* [This inscription bears, in very peculiar Latin, that "I, Rosolia," daughter of such-and-such parents, "out of love for my Lord Jesus Christ, have resolved to dwell in this cave."]

is no occasion for straining significations, and assert, with more appearance of plausibility, that it was called *Pan-ormus*, from the size and convenience of its harbours, one of which is recorded anciently to have extended into the very centre of the city. And this is the account Diodorus gives of it: it was called *Panormus*, says he, because its harbour even penetrated to the very innermost parts of the city—*Pan-ormus*, in the Greek language, signifying *All a port*. And Procopius, in his History of the Wars of the Goths, assures us, that in the time of Belisarius, the port was deep enough for that general to run his ships up to the very walls of the city, and give the assault from them. It is not now so well entitled to this name as it was formerly. These harbours have been almost entirely destroyed and filled up, most probably, I think, by the violent torrents from the mountains that surround it, which are recorded sometimes to have laid waste great part of the city. Fazzello speaks of an inundation of which he was an eyewitness, that came down from the mountains with such fury that they thought the city would have been entirely swept away. He says it burst down the wall near to the royal palace, and bore away every thing that opposed its passage—churches, convents, houses, to the number of two thousand, and drowned upwards of three thousand people. Now, the fragments and ruins carried to the sea by such a torrent alone, would be sufficient to fill up a little harbour; so that we are not to be surprised that these capacious ports, for which it had been so much celebrated, no longer exist.

Next to Chameseno, Palermo is generally supposed to be the most ancient city in the island. Indeed, there still remain some monuments that carry back its origin to the times of the most remote antiquity. A bishop of Lucera has written on this subject. He is clearly of opinion that Palermo was founded in the days of the first patriarchs. You will laugh at this—so did I—but the bishop does not go to work upon conjecture only; he supports his opinion with such proofs, as, I own to you, staggered me a good deal. A Chaldean inscription was discovered about six hundred years ago, on a block of white marble; it was in the reign of William II., who ordered it to be translated into Latin and Italian. The bishop says there are many fragments in Palermo with broken inscriptions in this language, and seems to think it beyond a doubt that the city was founded by the Chaldeans in the very early ages of the world. This is the literal translation—"During the time that Isaac, the son of Abraham, reigned in the valley of Danasens, and Esau, the son of Isaac, in Idumea, a great multitude of Hebrews, accompanied by many of the people of Danasens, and many Phœnicians, coming into this triangular island, took up their habitation in this most beautiful place, to which they gave the name of *Panormus*."

The bishop translates another Chaldean inscription, which is indeed a great curiosity. It is still preserved, though not with that care that so valuable a monument of antiquity deserves. It is placed over one of the old gates of the city, and when that gate falls to ruin, it will probably be for ever lost. The translation is in Latin, but I shall give it you in English—"There is no other God but one God. There is no other power but this same God. There is no other conqueror but this God whom we adore. The commander of this tower is Saphu, the son of Eliphar, son of Esau, brother of Jacob, son of Isaac, son of Abraham. The name of the tower is Baych, and the name of the neighbouring tower is Pharat."

These two inscriptions seem to reflect a mutual light upon each other. Fazzello has preserved them both, and remarks upon this last, that it appears evidently from it that the tower of Baych was built antecedent to the time of Saphu (or, as we translate it, Zephu), who is only mentioned as commander of the tower, but not as its founder.

Part of the ruins of this tower still remain, and many more Chaldean inscriptions have been found amongst them, but so broken and mangled that little could be made of them. Fazzello is in great indignation at some masons he found demolishing these precious relics, and complains bitterly of it to the senate, whom he with justice upbraids for their negligence and indifference.

Conversing on this subject the other night with a gentleman who is well versed in the antiquities of this place, I took the liberty of objecting to the Greek etymology, *Pan-ormus*, it appearing extremely absurd to give a Greek name to the city long before the existence of the Greek nation: I added, that I was a good deal surprised Fazzello had not attempted to account for this seeming absurdity. He allowed the apparent validity of the objection, and blamed Fazzello for his negligence; but assured me that *Pan-ormus*, or something very nearly of the same sound, signified in the Chaldean language, and likewise in the Hebrew, a paradise or delicious garden; and that the Greeks, probably finding it so applicable, never thought of changing its name. This I was in no capacity to contradict. He added, too, that *Pan-ormus* was likewise an Arabic word, and signified *This water*; which probably was the reason that the Saracens did not change its name, as they have done that of almost every thing else, as this is as applicable and as expressive of the situation of Palermo as any of the other etymologies, it being surrounded on all sides with beautiful fountains of the purest water, the natural consequence of the vicinity of the mountains.\*

Pray show this letter to our friend Mr Crofts, and desire his sentiments on these etymologies and antiquities. Tell him I have not forgot his commission, and shall procure him all the oldest and most unintelligible books in Palermo; but I must beg, for the repose and tranquillity of mankind, that he will not republish them. On these conditions, I send him a most valuable fragment: it is part of a Chaldean inscription that has been exactly copied from a block of white marble found in the ruins of the tower Baych. I own I should like much to see it translated; the people here have as yet made nothing of it, and we were in no capacity to assist them.

Adieu. The weather has become exceedingly hot. The thermometer is at 80 degrees. Ever yours.

#### SICILIAN FISHERIES.—GOVERNMENT.

Palermo, July 24.

In the course of our acquaintance with some gentlemen of sense and observation in this place, we have learned many things concerning the island, that perhaps may be worthy of your attention; and as this day is so hot that I cannot go out, I shall endeavour to recollect some of them, both for your amusement and my own. The thermometer is up to 81½ degrees; so you may judge of the situation of our northern constitutions.

There is one thing, however, that I have always observed in these southern climates, that although the degree of heat is much greater than with us, yet it is not commonly attended with that weight and oppression of spirits that generally accompany our sultry days in summer. I am sure that in such a day as this, in England, we should be panting for breath, and no mortal would think either of reading or writing. That is not the case here; I never was in better spirits

\* [Palermo continues to be the capital of Sicily; its court and nobility, its beautiful public and private buildings, are still liable to the description given by Mr Brydone; but the population has sunk considerably, and is now estimated at 130,000. Ferdinand, King of the Two Sicilies, when he retired from Naples in 1798, on the approach of the French republican army, took up his abode at Palermo, where he resided for some years. About five hundred foreign vessels enter the port of Palermo annually.]

in my life: indeed, I believe the quantities of ice we eat may contribute a good deal towards it; for I find that in a very violent heat there is no such cordial to the spirits as ice, or a draught of ice water; it is not only from the cold it communicates, but, like the cold bath, from the suddenness of that communication, it braces the stomach, and gives a new tone to the fibres. It is strange that this piece of luxury (in my opinion the greatest of all, and perhaps the only healthy one) should still be so much neglected with us.

I knew an English lady at Nice, who in a short time was cured of a threatening consumption only by a free indulgence in the use of ices; and I am persuaded that in skilful hands few remedies would be more effectual in many of our stomach and inflammatory complaints, as hardly any thing has a stronger or more immediate effect upon the whole frame; and surely our administering of warm drinks and potions in these complaints tend often to nourish the disease. It is the common practice here, in inflammatory fevers, to give quantities of ice-water to drink; nay, so far have they carried it, that Dr Sanghes, a celebrated Sicilian physician, covered over the breast and belly of his patients with snow or ice, and they assure us, in many cases with great success. But, indeed, I ought in justice to add, that this physician's practice has not been generally adopted.

Perhaps it is from the present benefit I find from ice that I have said so much in favour of it; for I am fully persuaded, that if I had not a quantity of it standing here below the table, I should very soon be obliged to give up writing and go to bed; but whenever I begin to flag, another glass is sure to set me to rights again.

I was going to give you some account of the fisheries of this island.

The catching the tunny-fish constitutes one of the principal Sicilian amusements during the summer months; and the curing and sending them to foreign markets makes one of the greatest branches of their commerce. We were invited yesterday by the Prince Sperlinga to a party of tunny-fishing, but the violence of the heat prevented it.

These fish do not make their appearance in the Sicilian seas till towards the latter end of May, at which time the *tonnaros*, as they call them, are prepared for their reception. This is a kind of aquatic castle, formed, at a great expense, of strong nets, fastened to the bottom of the sea, by anchors and heavy leaden weights.

These *tonnaros* are erected in the passages amongst the rocks and islands that are most frequented by the tunny-fish. They take care to shut up with nets the entry into these passages, all but one little opening, which is called the outward gate of the *tonnaro*. This leads into the first apartment, or, as they call it, the hall. As soon as the fish have got into the hall, the fishermen, who stand sentry in their boats during the season, shut the outer door, which is no more than letting down a small piece of net, which effectually prevents the tunny from returning by the way they came. They then open the inner door of the hall, which leads to the second apartment, which they call the antechamber, and, by making a noise on the surface of the water, they soon drive the tunny-fish into it. As soon as the whole have got into the antechamber, the inner door of the hall is again shut, and the outer door is opened for the reception of more company.

Some *tonnaros* have a great number of apartments, with different names to them all—the saloon, the parlour, the dining-room, &c., but the last apartment is always styled *la camera della morte*, the chamber of death; this is composed of stronger nets and heavier anchors than the others.

As soon as they have collected a sufficient number of tunny-fish, they are driven from all the other apartments into the chamber of death, when the slaughter

begins. The fishermen, and often the gentlemen too, armed with a kind of spear or harpoon, attack the poor defenceless animals on all sides, which, now giving themselves up to despair, dash about with great force and agility, throwing the water over all the boats, and tearing the nets to pieces; they often knock out their brains against the rocks or anchors, and sometimes even against the boats of their enemies.

You see there is nothing very generous or manly in this sport. The taking of the *pesce spada*, or sword-fish, is a much more noble diversion; no art is made use of to ensnare him; but with a small harpoon, fixed to a long line, they attack him in the open seas, and will often strike him at a very considerable distance. It is exactly the whale-fishing in miniature. The Sicilian fishermen (who are abundantly superstitious) have a Greek sentence which they make use of as a charm to bring him near their boats. This is the only bait they use, and they pretend that it is of wonderful efficacy, and absolutely obliges him to follow them; but if unfortunately he should overhear them speak a word of Italian, he plunges under water immediately, and will appear no more.

As these fish are commonly of a great size and strength, they will sometimes run for hours after they are struck, and afford excellent sport. I have seen them with a sword four or five feet long, which gives them a formidable appearance in the water, particularly after they are wounded. The flesh of these animals is excellent; it is more like beef than fish, and the common way of dressing it is in steaks.

The fishing of the *pesce spada* is most considerable in the sea of Messina, where they have likewise great quantities of eels, particularly the *morena*, so much esteemed amongst the Romans, which I think is indeed the finest fish I ever ate.

But it is not only their large fish that they strike with harpoons, they have the same method of taking mullet, dories, a kind of mackerel, and many other species; but this is always performed in the night. As soon as it is dark, two men get into a small boat; one of them holds a lighted torch over the surface of the water, the other stands with his harpoon ready poised in his hand. The light of the torch soon brings the fish to the surface, when the harpooner immediately strikes them. I have seen great quantities killed in this manner, both here and at Naples. A large fleet of boats employed in this kind of fishing makes a beautiful appearance on the water in a fine summer night.

The coral fishery is chiefly practised at Trapani; they have invented a machine there, which answers the purpose much beyond their expectations. This is only a great cross of wood, to the centre of which is fixed a heavy hard stone, capable of carrying the cross to the bottom. Pieces of small net are tied to each limb of the cross, which is poised horizontally by a rope, and let down into the water. As soon as they feel it touch the bottom, the rope is made fast to the boat. They then row about all over the coral beds; the consequence of which is, the great stone breaks off the coral from the rocks, and it is immediately entangled in the nets. Since this invention, the coral fishery has turned out to considerable account.

The people of Trapani are esteemed the most ingenious of the island; they are the authors of many useful and ornamental inventions. An artist there has lately discovered a method of making cameos, which are a perfect imitation of the ancient ones engraved on the onyx. They are done on a kind of hard shell from pastes of the best antiques, and so admirably executed, that it is often difficult to distinguish the ancient from the modern. These, set in gold, are generally worn as bracelets, and are at present in high estimation amongst the ladies of quality here. Mrs Hamilton\* procured a pair of them last year, and

\* Now Lady Hamilton. [First wife of Sir William Hamilton, British ambassador at Naples.]

carried them to Naples, where they have been much admired. Commissions were immediately sent over, and the man has now more business than he can manage; however, we have been fortunate enough to procure a few pairs of them for our friends. I have seen cameos that have cost 200 guineas, that could scarce be distinguished from one of these.

The difficulties under which the poor Sicilians labour, from the extreme oppression of their government, obliges them sometimes to invent branches of commerce that nature seems to have denied them, as they are not allowed to enjoy those she has bestowed. The sugar-cane was very much cultivated in this island, but the duties imposed were so enormous, that it has been almost abandoned. But their crops of wheat alone, were they under a free government, would soon be sufficient to render this little nation one of the richest and most flourishing in the world; for even in the wretched state of cultivation it is in at present, one good crop, I am told, is sufficient to maintain the island for seven years. You will be a good deal surprised, after this, to hear that the exportation of this commodity has been prohibited for these several years past, at least to all such as are not able to pay most exorbitantly for that privilege. The consequence is, that corn has become a drug. The common price of the *salma*, which is two loads, was about thirty-one shillings; at present it is reduced to five shillings and sixpence, and there is a probability that it will still fall lower.

This crop, which has been very abundant, I am told, in many places, they have hardly been at the pains to gather in, as there is little probability of this cruel prohibition being removed. The farmers are already ruined, and the ruin of their masters must inevitably follow. This is the method the ministry of Naples, or rather that of Spain, has taken to humble the pride of the Sicilian barons, whose power they pretend is still very extensive, and their jurisdiction absolute, most of them possessing a right of life and death in their own domains. However, there is a probability that they will soon be obliged to relinquish their privileges. The complaint is universal, and if the ministry persevere in these rigorous measures, there must either be a revolt, or they must soon be reduced to a state of poverty as well as of servitude. I believe, indeed, most of them would readily embrace any plausible scheme to shake off their yoke, as in general they appear to be people of great sensibility, with high notions of honour and liberty.

Talking of the natural riches of their island: Yes, say they, if these were displayed, you would have reason indeed to speak of them. Take a look of these mountains—they contain rich veins of every metal, and many of the Roman mines still remain; but to what end should we explore them? It is not we that should reap the profit. Nay, a discovery of any thing very rich might possibly prove the ruin of its possessor. No: in our present situation the hidden treasures of the island must ever remain a profound secret. Were we happy enough to enjoy the blessings of your constitution, you might call us rich indeed. Many hidden doors of opulence would then be opened, which now are not even thought of, and we should soon re-assume our ancient name and consequence; but at present we are nothing.

This is the language that some of the first people amongst them hold with us. However, they still boast that they retain more of the feudal government than any nation in Europe. The shadow indeed remains, but the substance is gone long ago. It has long been the object of the Bourbon ministry to reduce the power of the barons in every kingdom. Richelieu began the system in France, and it has ever since been prosecuted by his successors; its influence has now spread over the whole of their possessions in Europe, of which, as this is the most remote, it has likewise been the longest in reaching it.

The foundation of the feudal system was first laid here by the Count Rugiero, about the middle of the eleventh century, immediately after he had driven the Saracens out of the island. He divided Sicily into three parts; the first, by consent of his army, was given to the church, the second he bestowed upon his officers, and the third he reserved for himself.

Of these three branches, or, as they call them, *Braccios* (arms), he composed his parliament, the form of which remains the same to this day. The *Braccio Militare* is composed of all the barons of the kingdom, to the number of two hundred and fifty-one, who are still obliged to military service; their chief is the Prince Butero, who is hereditary president of the parliament, for, in conformity to the genius of the feudal government, some of the great offices are still hereditary. The three archbishops, all the bishops, abbés, priors, and dignified clergy, amounting to near seventy, form the *Braccio Ecclesiastico*; the Archbishop of Palermo is their chief. The *Braccio Demaniale* is formed by election, like our House of Commons: there are forty-three royal cities, styled *Demaniale*, that have a right to elect members. Every householder had a vote in this election. Their chief is the member for Palermo, who is likewise prætor (or mayor) of the city. He is an officer of the highest rank, and his power is very extensive, inferior only to that of the viceroy, in whose absence the greater part of the authority devolves upon him. He has a company of grenadiers for his body-guard, and receives the title of excellency.

The prætor, together with six senators, who are styled patricians, have the management of the civil government of the city. He is appointed every year by the king, or by the viceroy, which is the same thing; for I don't find that the people any longer exercise even the form of giving their votes, so that the very shadow of liberty has now disappeared as well as the substance. You may judge of the situation of liberty in a kingdom, where all courts civil and criminal are appointed by regal authority, and where all offices are conferred only by the will of the sovereign, and depend entirely upon his caprice.

I own I feel most sincerely for the Sicilians, who, I think, are possessed of many admirable qualities. But the spirit of every nation must infallibly sink under an oppressive and tyrannical government. Their spirit, however, has in a great measure kept them free from one branch of tyranny, the most dreadful of all, that of the inquisition. The kings of Spain wanted to establish it in its full force; but the barons, accustomed to exercise despotic government themselves, could not bear the thoughts of becoming slaves to a set of ignorant Spanish priests; and, I believe, they took the only way that was left to avoid it. Every inquisitor that pretended to more zeal than they thought became him, was immediately assassinated, particularly if he presumed to interfere with the conduct or sentiments of the nobility. This soon took off the edge of their zeal, and reduced the holy office to a becoming moderation. However, they are extremely circumspect in their conversation about religious matters, and generally advise strangers to be on their guard, as the power of the inquisition, although considerably reduced, is by no means annihilated.

The laws of Sicily are scattered in a great number of volumes; these the King of Sardinia intended to abridge and collect into one code, but unfortunately he was not long enough in possession of the island to accomplish this useful work. But where there is an authority above all laws, laws can be but of little service.

The power of the viceroy is very absolute: he has not only the command of all the military force in the kingdom, but likewise presides with unbounded authority in all civil tribunals; and as he is also invested with the legantine power, his sway is equally great in religious matters.

He has the right of nominating to all the great

offices in the kingdom, and confirming of all dignities, both civil and ecclesiastical.

In visiting the prisons, a ceremony which he performs with great pomp twice a-year, he has the power of liberating whatever prisoners he pleases, of reducing or altering their sentences, their crimes and accusations having first been read over to him. Indeed, that there may be some appearance of a regard to law and justice, his counsellor always attends him on these occasions, to mark out the limits of the law. This is an officer of very high rank, appointed to assist the viceroy in his decisions, where the case may appear intricate or dubious, and always is, or ought to be, one of the ablest lawyers in the island. For the most part, this office has been given to strangers, who are supposed to have no kindred or particular connexions here, that in giving their judgment they may be free from all prejudice and partiality. He has free admittance into all courts and tribunals, that he may be the better enabled to give the viceroy an account of their proceedings.

The whole military force of Sicily amounts at present, from what I can learn, to 9500 men, about 1200 of whom are cavalry. Many of their cities and fortresses would require a very numerous garrison to defend them, particularly Messina, Syracuse, and Palermo; but indeed the state of their fortifications, as well as that of their artillery, is such, that even if they were inclined they could make but a small defence.

If this island were in the hands of a naval power, I think it is evident that it must command the whole Levant trade. There are several little ports at each end of it, besides the great ones of Trapani, Syracuse, and Messina, which lie pretty near the three angles of the triangle. Whatever ships had passed either of these, the others could be apprised of it in the space of half an hour, by means of signal towers, which the Sicilians have erected all round their island, to warn them against sudden invasions from the Barbary side. These towers are built on every little promontory, within sight of each other. Fires are always kept ready for lighting, and a person is appointed to watch at each of them, so that the whole island can be alarmed, they assure us, in the space of an hour.

By the bye, we have been witness here of a practice that appears to be a very iniquitous one, and in the end, I should think, must prove the destruction of our Mediterranean trade. Several ships have put in at this port with English colours, but, to our surprise, without one Englishman on board. These, I find, they call *bandiere men*; perhaps it is a known practice, although, I own, I was an utter stranger to it. They are very numerous in these seas, and carry on a considerable trade through the whole of the Mediterranean, to the great detriment of our own ships. Most of them belong to Genoa and Sicily, though they pass under the name of Minorquins. They purchase Mediterranean passports, I am told, from some of the governors of our garrisons, which entitle them, during the term specified in these passports, to trade under English colours. I am assured that the number of these *bandiere men* amounts to some hundreds. They have often one or two English sailors on board, or at least some person that speaks the language, to answer when they are challenged. Pray, can you tell me if this practice is known in England?

Adieu. The heat has become intolerable, and I am able to write no more. However, I should not have given it up yet, but my ice is all melted, and I have not the conscience to send out a servant for more. I dare say you are very glad of it, and wish it had been melted long ago. If this continues, I believe we ourselves shall be melted. The thermometer is above 82 degrees, and the heat still seems to increase. The sea has even become too hot for bathing, and it does not at all refresh us now as it did formerly. Farewell.

## EQUIPAGES OF THE NOBILITY.

Palermo, July 26.

We have now got every thing ready for our departure, and, if the wind continues favourable, this is probably the last letter I shall write you from Sicily. However, I had still a great deal more to say, both of the Sicilians and their island, and shall leave them, I assure you, with a good deal of regret.

The Sicilians still retain some of the Spanish customs, though nothing of their gravity or taciturnity. The younger sons of the nobility are styled *don* by their christened names, and the daughters *donna*, like our appellation of lord and lady to the sons and daughters of dukes. The eldest son has commonly the title of count or marquis, but they are not all counts as in France and Germany, where I have seen six counts in one house, and very near twice the number of barons in another.

One of the most common titles here, as well as at Naples, is that of prince; and although these were only created by Philip II. of Spain, they take rank of all the other nobility, some of whom, particularly the counts, carry their origin as far back as the time of the Normans, and look with great contempt on these upstart princes. The dukes and marquises are not so old: the first were created by Charles V., and the second, though an inferior title, by King Alphonso, in the fifteenth century. So that the dignity of the Sicilian titles may be said to be in the inverse ratio of their antiquity.

The luxury of the people here, like that of the Neapolitans, consists chiefly in their equipages and horses; but by a wise law of the King of Sardinia, which I am surprised should still remain in force, the viceroy alone is allowed to drive in the city with six horses; the prætor, the archbishop, and president of the parliament, with four; all the rest of the nobility are restricted to two. But this is only within the gates of Palermo; and when they go to the country, there is none of them that drive with less than four—besides, every family of distinction has at least two or three carriages in daily use, for no man of fashion is so unpolite as to refuse his wife a chariot of her own, of which she has the entire command (without this the Marino could never subsist), and the upper servants of the first families would be just as much ashamed to be seen on foot as their masters. We took the liberty to ridicule the folly of this practice; they allow of its absurdity, and wish to break through it; but who is to lead the way? We even prevailed with some of the young nobility, which I assure you was no small condescension, to walk the streets with us during the illuminations; but even this condescension showed the folly of the prejudice in a stronger light than if they had refused us, for they would not be prevailed on to stir out till they had sent their servants about ten yards before them, with large wax flambeaux, although the whole city was in a flame of light. You may believe we did not spare them upon this occasion; but it was all to no purpose. However, it is possible that we may overlook many customs of our own that are not less ridiculous; for ridicule for the most part is relative, and depends only on time and place. Perhaps you may remember the Prince of Anamaboo: I should like to hear the account he would give of the English nation in his own country for some of our customs struck him in a still more ridiculous light. Walking out in St James's Park in the afternoon, he observed one of his acquaintance driving in a phaeton with four horses. The prince burst into a violent fit of laughing, when they asked him what was the matter. "Vat the devil," said the prince, in his bad English, "has that fellow ate so much dinner that now it takes four horses to carry him? I rode out with him this morning, and he was then so light, that van little horse run away with him,

He must either be a great fool or a great glutton." Another time they insisted on the prince going to the play. He went; but he soon tired of it, and returned to his companions. "Well, prince," said they, "what did you see?" "What did I see!" replied he, with the utmost contempt; "I did see some men playing de fiddle, and some men playing de fool."

I only infer from this that it is with some degree of caution we should ridicule the customs of other nations: a Sicilian, perhaps, would laugh with as much justice at many of our customs—that, for instance, of obliging people to drink when they have no inclination to it—that in the north, of eating Solan geese before dinner to give them an appetite—that of physicians and lawyers wearing enormous wigs—and many others that will naturally occur to you, none of which appear in the least ridiculous to the people that practise them, who would no doubt defend them as strenuously as the Sicilians do the necessity of carrying flambeaux before them during the great illumination. Indeed, they have just now given us an admirable specimen of some of our ridicules, in one of their opera-dances, with which we have been a good deal entertained.

I believe I told you that the dancers are lately come from England; they have brought upon the stage many of the capital London characters—the bucks, the macaronies, the prigs, the cits, and some others still more respectable: these are well supported, and afford a good deal of laughing. But I am interrupted, otherwise I should have given you a more particular account of them. Adieu. The heat is intolerable, and there is no possibility of walking out. We complain without reason of our own climate; and King Charles's observation, I am persuaded, was just—"That there is hardly any climate where, throughout the year, we can have so much exercise in the open air." Ever yours.

#### ANCIENT SUPERSTITIONS.—FEMALE BEAUTY.

Palermo, July 27.

THE Sicilians are animated in conversation, and their action for the most part is so just and so expressive of their sentiments, that without hearing what is said, one may comprehend the subject of their discourse. We used to think the French and Neapolitans great adepts in this art, but they are much outdone by the Sicilians, both in the variety and justness of their gesticulation.

The origin of this custom they carry so far back as the time of the earliest tyrants of Syracuse, who, to prevent conspiracies, had forbid their subjects, under the most severe penalties, to be seen in parties talking together. This obliged them to invent a method of communicating their sentiments by dumb show, which they pretend has been transmitted from generation to generation ever since.

I think it is not at all improbable that this custom, too, may have given the first idea of comedy; as we find that, some short time after, Epicarmus, a native of that city, was the author of this invention.

The Sicilians till lately retained a great many foolish and superstitious customs, but particularly in their marriage and funeral ceremonies: it would be tedious to give you an account of all these; some of them are still practised in the wild and mountainous parts of the island. As soon as the marriage ceremony is performed, two of the attendants are ready to cram a spoonful of honey into the mouths of the bride and bridegroom, pronouncing it emblematical of their love and union, which they hope will ever continue as sweet to their souls as the honey is to their palates. They then begin to throw handfuls of wheat upon them, which is continued all the way to the house of the bridegroom. This is probably the remains of some

ancient rite to Ceres, their favourite divinity, and they think it cannot fail of procuring them a numerous progeny.

The young couple are not allowed to taste of the marriage-feast; this they pretend is to teach them patience and temperance; but when dinner is finished, a great bone is presented to the bridegroom by the bride's father, or one of her nearest relations, who pronounces these words—"Rodi tu quest'osso, &c.—Pick you this bone, for you have now taken in hand to pick one which you will find much harder and of more difficult digestion." Perhaps this may have given rise to the common saying, when one has undertaken any thing arduous or difficult, that "He has got a bone to pick."

The Sicilians, like most other nations in Europe, carefully avoid marrying in the month of May, and look upon such marriages as extremely inauspicious. This piece of superstition is as old as the time of the Romans, perhaps older, by whose authors it is frequently mentioned, and by whom it has been transmitted to almost every nation in Europe. It is somewhat unaccountable that so ridiculous an idea, which can have no foundation in nature, should have stood its ground for so many ages. There are indeed other customs, still more trivial, that are not less universal. That of making April fools on the first day of that month, the ceremony of the cake on Twelfth-night, and some others that will occur to you, of which, any more than of this, I have never been able to learn the origin.

The marriages of the Sicilian nobility are celebrated with great magnificence, and the number of elegant carriages produced on these occasions is astonishing. I wanted to discover when this great luxury in carriages had taken its rise, and have found an account of the marriage of the daughter of one of their viceroys to the Duke of Bivona, in the year 1551. It is described by one Elenco, who was a spectator of the ceremony. He says, the ladies as well as gentlemen were all mounted on fine horses, sumptuously caparisoned, and preceded by pages; that there were only three carriages in the city, which were used by invalids who were not able to ride on horseback. These he calls *carrette*, which word now signifies a little cart.

The Sicilian ladies marry very young, and frequently live to see the fifth or sixth generation. You will expect, no doubt, that I should say something of their beauty. In general, they are sprightly and agreeable; and in most parts of Italy they would be esteemed handsome. A Neapolitan or a Roman would surely pronounce them so, but a Piedmontese would declare them very ordinary—so, indeed, would most Englishmen. Nothing is so vague as our ideas of female beauty; they change in every climate, and the criterion is nowhere to be found.

Ask where's the north?—at York 'tis on the Tweed,  
In Scotland at the Orcaes, and there  
At Nova Zembla, or no one knows where.

No two nations, perhaps no two men, have affixed precisely the same characteristics; and every one exalts his idea of it according to the beauty of the woman he is accustomed to see, so that even the same person may sometimes appear beautiful, sometimes ugly, just in proportion as we have seen others that are more or less so. I remember, after making the tour of Savoy and the Lower Valais, every woman we met in Switzerland appeared an angel. The same thing happens in travelling through some parts of Germany; and you will easily recollect the surprising difference betwixt a beauty at Milan and one at Turin, although these places lie adjacent to each other. It is a pity that the Juno of Zeuxis has been lost, if it were no more than to have shown us the notion the ancients had of a perfect beauty. Indeed, the Venus of Medici has been considered as a model of perfection, but it is surely absurd; for who ever heard of a

perfect beauty of five feet high! the very idea is ridiculous; and whatever figure her goddessship might make amongst the ancient divinities in the Pantheon at Rome, I am afraid she would cut but a sorry one amongst the modern ones in that of London. In short, I believe we may safely conclude, that beauty is a relative quality; and the *to kalon* is no longer the same, no more in a physical than in a moral sense, in any two places on the globe.

The ladies here have remarkably fine hair, and they understand how to dress and adorn it to the greatest advantage. It is now only used as an embellishment; but in former times, we are told, that, like that of Sampson, it was found to be the strength and protection of their country. There is a paradox for you, that all the wise men in the east could hardly solve. Their historians relate (in whose reign, I believe, is rather dubious), that this city had suffered a long siege from the Saracens, and was greatly reduced by famine; but, what distressed them still more, there were no materials to be found for making bowstrings, and they were on the point of surrendering. In this dilemma, a patriotic dame stepped forth, and proposed to the women that the whole of them should cut off their hair and twist it into bowstrings: this was immediately complied with. The heroism of the women, you know, must ever excite that of the men. The besieged, animated by this gallant sacrifice of the fair, renewed their defence with such vigour, that the assailants were beat off; and a reinforcement soon after arriving, the city was saved. The ladies still value themselves on this story, which you may believe has not been forgotten by their bards. "The hair of our ladies," says one of their quaint poets, "is still employed in the same office; but now it discharges no other shafts but those of Cupid, and the only cords it forms are the cords of love."

The Sicilians are much fonder of study than their neighbours on the continent; and their education is much more attended to. We were a good deal surprised to find, that instead of that frivolity and nothingness which so often constitute the conversation of the Italian nobility, here their delight was to talk on subjects of literature, of history, of politics, but chiefly of poetry; for the other branches of knowledge and science are only general, this is the only one that may be said to be universal. Every person, in some period of his life, is sure to be inspired; and a lover is never believed so long as he can speak of his passion in prose; and, contrary to our way of reasoning, is only reckoned true in proportion as he is poetical. Thus, inspiration, you see, has here become the test of truth.

We were astonished, on our first arrival at Palermo, to hear ourselves addressed in English by some of the young nobility, but still more so to find them intimately acquainted with many of our celebrated poets and philosophers—Milton, Shakspeare, Dryden, Pope, Bacon. Bolingbroke we found in several libraries, not in the translation, but generally in the best editions of the original.

Our language, indeed, has become so much in vogue, that it is now looked upon as no immaterial part of a polite education: the viceroy, the Marquis Fogliano, a man of great merit and humanity, has made some of our authors his favourite study, and greatly encourages the progress it is making in his kingdom. Many of the nobility speak it a little, and some of them even with ease and fluency, although they have never been out of their island—the Marquis Natali, the Counts Statela and Buschemi, the Duke of St Micheli, &c., in whose company we have enjoyed a great deal of pleasure, and whose knowledge and erudition is the least part of their praise. Adieu. Yours, &c.

## THE OPERA AT PALERMO.

Palermo, July 28.

I HAD almost forgot to say any thing of the opera. It would have been very ungrateful, for we have been much delighted with it. The first and second man are both admirable singers, and I make no doubt you will have them in London in a few years. Neither of them are as yet known, and I daresay at present they might be engaged for a very moderate price; but in Italy they will soon be taught to estimate their value. The name of the first is Pachierotti; he is very young, and an entire stranger in the musical world; yet I am persuaded, that after he has been heard on the different theatres in Italy, he will be esteemed one of their capital performers. His excellence is the pathetic, at present too much neglected in most theatres; and indeed, I think, he gives more expression to his *cantabile* airs, and makes his hearers feel more, because he feels more himself, than any that I have seen in Italy. He indeed addresses himself to the heart, while most of the modern performers sing only to the fancy.

The first woman is Gabrieli, who is certainly the greatest singer in the world; and those that sing in the same theatre with her, must be capital, otherwise they never can be attended to. This, indeed, has been the fate of all the other performers except Pachierotti; and he, too, gave himself up for lost on hearing her first performance. It happened to be an air of execution, exactly adapted to her voice, which she exerted in so astonishing a manner, that before it was half done, poor Pachierotti burst out a-crying, and ran in behind the scenes, lamenting that he had dared to appear on the same stage with so wonderful a singer, where his small talents must not only be lost, but where he must ever be accused of a presumption which he hoped was foreign to his character.

It was with some difficulty they could prevail on him to appear again; but from an applause well merited both from his talents and his modesty, he soon began to pluck up a little courage, and in the singing of a tender air, addressed to Gabrieli in the character of a lover, even she herself, as well as the audience, is said to have been moved.

Indeed, in these very pathetic pieces, I am surprised that the power of the music does not sometimes altogether overcome the delusion of character; for when you are master of the language, and allow the united power of the poetry, the action, and the music to have its full force on the mind, the effect is wonderfully great. However, I have never heard that this happened completely but once; and it was no less a singer than Farinelli that produced it. He appeared in the character of a young captive hero, and in a tender air was soliciting mercy for his mistress and himself, of a stern and cruel tyrant, who had made them his prisoners. The person that acted the tyrant was so perfectly overcome by the melting strains of Farinelli, that instead of refusing his request as he ought to have done, he entirely forgot his character, burst into tears, and caught him in his arms.

The performance of Gabrieli is so generally known and admired, that it is needless to say any thing to you on that subject. Her wonderful execution and volubility of voice have long been the admiration of Italy, and has even obliged them to invent a new term to express it; and would she exert herself as much to please as to astonish, she might almost perform the wonders that have been ascribed to Orpheus and Timotheus. But it happens, luckily perhaps for the repose of mankind, that her caprice is, if possible, even greater than her talents, and has made her still more contemptible than these have made her celebrated. By this means, her character has often proved a sufficient antidote, both to the charms of her voice and those of her person, which are indeed almost equally powerful; but if these had been united to the

qualities of a modest and an amiable mind, she must have made dreadful havoc in the world. However, with all her faults, she is certainly the most dangerous syren of modern times, and has made more conquests, I suppose, than any one woman breathing.

It is but justice to add, that contrary to the generality of her profession, she is by no means selfish or mercenary, but, on the contrary, has given many singular proofs of generosity and disinterestedness. She is very rich, from the bounty, as is supposed, of the last emperor, who was fond of having her at Vienna; but she was at last banished that city, as she has likewise been most of those in Italy, from the broils and squabbles that her intriguing spirit, perhaps still more than her beauty, had excited. There are a great many anecdotes concerning her, that would not make an unentertaining volume; and, I am told, either are or will soon be published.

Although she is considerably upwards of thirty, on the stage she scarcely appears to be eighteen; and this art of appearing young is none of the most contemptible that she possesses. When she is in good humour, and really chooses to exert herself, there is nothing in music that I have ever heard to be compared to her performance; for she sings to the heart as well as the fancy when she pleases, and then she commands every passion with unbounded sway. But she is seldom capable of exercising these wonderful powers; and her caprice and her talents, exerting themselves by turns, have given her all her life the singular fate of becoming alternately an object of admiration and of contempt.

Her powers in acting and reciting are scarcely inferior to those of her singing; sometimes, a few words in the recitative, with a simple accompaniment only, produces an effect that I have never been sensible of from any other performer; and inclines me to believe what Rousseau advances on this branch of music, which with us is so much despised. She owes much of her merit to the instructions she received from Metastasio, particularly in acting and reciting; and he allows that she does more justice to his operas than any other actress that ever attempted them.

Her caprice is so fixed and so stubborn, that neither interest, nor flattery, nor threats, nor punishments, have the least power over it; and it appears, that treating her with respect or contempt have an equal tendency to increase it.

It is seldom that she condescends to exert these wonderful talents, least of all if she imagines that such an exertion is expected. And instead of singing her airs as other actresses do, for the most part she only hums them over, *a mezza voce*; and no art whatever is capable of making her sing, when she does not choose it.

The most successful expedient has ever been found to prevail on her favourite lover—for she always has one—to place himself in the centre of the pit, or the front box; and if they are in good terms, which is seldom the case, she will address her tender airs to him, and exert herself to the utmost. Her present innamorato promised to give us this specimen of his power over her: he took his place accordingly; but Gabrieli, probably suspecting the connivance, would take no notice of him, so that even this expedient does not always succeed.

The viceroy, who is fond of music, has tried every method with her to no purpose. Some time ago, he gave a great dinner to the principal nobility of Palermo, and sent an invitation to Gabrieli to be of the party. Every other person arrived at the hour of invitation. The viceroy ordered dinner to be kept back, and sent to let her know that the company waited her. The messenger found her reading in bed: she said she was sorry for having made the company wait, and begged he would make her apology, but that really she had entirely forgot her engagement.

The viceroy would have forgiven this piece of insolence, but, when the company came to the opera, Ga-

brieli repeated her part with the most perfect negligence and indifference, and sung all her airs in what they call *sotto voce*, that is, so low that they can scarcely be heard. The viceroy was offended; but as he is a good-tempered man, he was loath to make use of authority; but at last, by a perseverance in this insolent stubbornness, she obliged him to threaten her with punishment in case she any longer refused to sing.

On this she grew more obstinate than ever, declared that force and authority should never succeed with her; that he might make her cry, but that he never could make her sing. The viceroy then sent her to prison, where she remained twelve days, during which time she gave magnificent entertainments every day, paid the debts of all the poor prisoners, and distributed large sums in charity. The viceroy was obliged to give up struggling with her, and she was at last set at liberty amidst the acclamations of the poor. Luckily for us, she is at present in good humour, and sometimes exerts herself to the utmost of her power.

She says she has several times been on terms with the managers of our opera, but thinks she shall never be able to pluck up resolution enough to go to England. What do you think is her reason? It is by no means a bad one. She says she cannot command her caprice, but that for the most part it commands her; and that there she could have no opportunity of indulging it: for, says she, were I to take it into my head not to sing, I am told the people there would certainly mob me, and perhaps break my bones; now, I like to sleep in a sound skin, although it should even be in a prison. She alleges, too, that it is not always caprice that prevents her from singing, but that it often depends upon physical causes; and this, indeed, I can readily believe, for that wonderful flexibility of voice that runs with such rapidity and neatness through the most minute divisions, and produces almost instantaneously so great a variety of modulation, must surely depend on the very nicest tone of the fibres. And if these are in the smallest degree relaxed, or their elasticity diminished, how is it possible that their contractions and expansions can so readily obey the will as to produce these effects? The opening of the glottis, which forms the voice, is extremely small, and in every variety of tone its diameter must suffer a sensible change; for the same diameter must ever produce the same tone. So wonderfully minute are its contractions and dilatations, that Dr Keill, I think, computes that in some voices its opening—not more than the tenth of an inch—is divided into upwards of twelve hundred parts, the different sound of every one of which is perceptible to an exact ear. Now, what a nice tension of fibres must this require! I should imagine even the most minute change in the air must cause a sensible difference, and that in our foggy climate the fibres would be in danger of losing this wonderful sensibility, or at least that they would very often be put out of tune. It is not the same case with an ordinary voice, where the variety of divisions run through, and the volubility with which they are executed, bear no proportion to those of a Gabrieli.

One of the ballets of our opera is a representation of Vauxhall gardens, and this is the third time I have seen Vauxhall brought upon the Italian theatre—at Turin, at Naples, and here. The gardens are well represented, and the idea must have been given by some person that had been on the spot. A variety of good English figures are brought in; some with large frizzled wigs, sticking half a yard out behind their necks; some with little cut scratches, that look extremely ridiculous. Some come in cracking their whips, with buckskin breeches and jockey caps. Some are armed with great oaken sticks, their hair tied up in enormous clubs, and stocks that swell their necks to double the natural size. But what affords the principal part of the entertainment, is three Quakers, who are duped by three ladies of the town in concert with three jack tars, their lovers. These characters, as

you may believe, are much exaggerated, though, upon the whole, they are supported with humour, and have afforded us a good deal of laughing. However, we were hurt to see the respectable character of Quakers turned into such ridicule; and as the people here were altogether unacquainted with it, we have been at some pains to explain to them the simplicity and purity of their manners, and the incorruptible integrity of their principles.

Although the Sicilians in general are a good sort of people, and seem to be endowed with a large share of philanthropy and urbanity, yet it must be owned they have no great affection for their neighbours on the continent; and, indeed, the dislike is altogether reciprocal. It is somewhat singular—I am afraid not much for the honour of human nature—that through all Europe the two neighbouring nations have a perpetual jarring with each other. I could heartily wish that we had been an exception from this rule, but I am sorry to see, from our newspapers, which are sent to the nobility of this city, that at present we are rather the most distinguished for it; at least our animosities, if there really are any, make by much the greatest noise of all. We have often been asked by foreigners what was the ground of the mighty quarrel, that such torrents of the most illiberal abuse have been poured out by a people so celebrated for liberality of sentiment; and it is with difficulty we can persuade them, that although from the papers this sometimes appears to be the voice of the nation, yet in fact it is only confined to a set of the most worthless and despicable incendiaries—like him who set the house in a flame, on purpose to pilfer during the conflagration. But the abuse that is levelled at the king surprises them more than all the rest; and you cannot conceive their amazement and indignation, when we assured them that, notwithstanding all this, he was the most virtuous and benevolent prince on earth. "Then," exclaimed a Sicilian nobleman, "you must certainly be the most detestable people on the globe." I was a good deal struck with the suddenness of the charge, and it was not without many explanations of the liberty of our constitution, and particularly that of the press, that I could prevail with him to retract his sentiments and think more favourably of us. Still he insisted, that so egregious an abuse of this liberty was only a farther proof of his position; and that there must be something essentially wrong in a nation that could allow of such abuse levelled at the most sacred of all characters—the highest virtue united to the highest station. We assured him that what he heard was only the voice of the most abandoned and profligate wretches in the nation, who, taking advantage of the great freedom of the press, had often made these newspapers the vehicles of the most detestable sedition; that both the king and queen were beloved by all their subjects, at least by all those of worth; that they never were spoken of but as the most perfect models of conjugal union and happiness, as well as of every social endowment; and that they could have no enemies but the enemies of virtue.

However, after all, we could but patch up a peace with him. He could not comprehend, he said, how the voice of a few incendiaries should be louder than the general voice of the nation. We told him, that people who were pleased commonly held their tongue, and that sedition and libel ever made a greater noise than panegyric—just as the fire-bell is rung louder and is more listened to than the bell for rejoicing.

Adieu. Our pilot says the wind is not fair, so that possibly we may still stay a day or two longer. Ever yours.

~~~~~

#### NATURAL PRODUCTIONS OF SICILY.

Palermo, July 29.

WERE I to enter upon the natural history of this island, it would lead me into a vast field of speculation,

for which I have neither time nor abilities: however, a variety of objects struck us as we travelled along, that it may not be amiss to give you some little account of. There are a variety of mineral waters, almost through the whole of Sicily. Many of these are boiling hot; others, still more singular, are of a degree of cold superior to that of ice, and yet never freeze.

In several places they have fountains that throw up a kind of oil on their surface, which is of great use to the peasants, who burn it in their lamps, and use it for many other purposes; but there is still a more remarkable one near Nicosia, which is called *Il Fonte Canalotto*. It is covered with a thick scum of a kind of pitch, which, amongst the country people, is esteemed a sovereign remedy in rheumatic and many other complaints.

The water of a small lake near Naso is celebrated for dyeing black every thing that is put into it; and this it is said to perform without the mixture of any other ingredient, although the water itself is remarkably pure and transparent.

They have a variety of sulphurous baths, like those near Naples, where the patient is thrown into a profuse sweat only from the heat of the vapour. The most celebrated are those of Sciacca, and on the mountain of St Cologero; not in the neighbourhood of *Ætna*, as I expected, but at a great distance from that mountain. But, indeed, I am much inclined to believe, that not only Mount *Ætna*, but the greatest part of Sicily, and almost the whole of the circumjacent islands, have been originally formed by subterraneous fire; but I shall have an opportunity of speaking more largely on this subject when I give you an account of the country round Naples.

I have observed lava, pumice, and tufa,\* in many parts of Sicily, at a great distance from *Ætna*; and there are a variety both of mountains and valleys that still emit a hot vapour, and produce springs of boiling water.

About a mile and a half to the west of this city, at a small beach where we often go a-swimming, there are many springs of warm water, that rise even within the sea at the depth of five or six feet. We were at first a good deal surprised to find ourselves almost instantaneously both in the hot and cold bath; for at one stroke we commonly passed through the hot water, which only extends for a few feet around the spring. It gave us a momentary glow, and produced a very odd, uncouth sensation, by no means an agreeable one. I mentioned this singularity to several gentlemen here, who tell me they have observed the same thing.

Not a great way from this is a celebrated fountain, called *Il Mar Dolce*, where there are some remains of an ancient naumachia; and in the mountain above it they show you a cavern where a gigantic skeleton is said to have been found: however, it fell to dust when they attempted to remove it: Fazzello says, its teeth were the only part that resisted the impression of the air; that he procured two of them, and that they weighed near two ounces. There are many such stories to be met with in the Sicilian legends, as it seems to be a universal belief that this island was once inhabited by giants; but although we have made diligent inquiry, we have never yet been able to procure a sight of any of these gigantic bones, which are said to be still preserved in many parts of the island. Had there been any foundation for this, I think it is probable they must have found their way into some of the museums; but this is not the case; nor, indeed, have we met with any person of sense and credibility that could say they had seen any of them. We had been assured at Naples that an entire skeleton, upwards of ten feet high, was preserved in the museum of Palermo; but there is no such thing there, nor, I believe, any where else in the island. This museum is

\* [See note on page 84.]

well furnished both with antiques and articles of natural history, but is not superior to what we have seen in many other places.

The number of souls in Palermo is computed at about 150,000. Those of the whole island, by the last numeration, amounted to 1,123,163; of which number there are about 50,000 that belong to the different monasteries and religious orders. The number of houses is computed at 268,120, which gives betwixt five and six to a house.

The great standing commodity of Sicily, which has ever constituted the riches of the island, was their crops of wheat; but they cultivate many other branches of commerce, though none that could bear any proportion to this, were it under a free government, and exportation allowed. Their method of preserving their grain will appear somewhat singular to our farmers: instead of exposing it, as we do, to the open air, they are at the greatest pains to exclude it entirely from it. In many places, where the soil is dry, particularly near Agrigentum, they have dug large pits or caverns in the rock. These open by a small hole at top, and swell to a great width below; here they pour down their grain, after it has been made exceedingly dry; and, ramming it hard, they cover up the hole to protect it from rain; and they assure us it will preserve in this manner for many years.

The *soda* is a plant that is much cultivated, and turns out to considerable account. This is the vegetable that, by the action of fire, is afterwards converted into mirrors and crystals. Great quantities of it are sent every year to supply the glass-houses at Venice. They have likewise a considerable trade in liquorice, rice, figs, raisins, and currants, the best of which grow amongst the extinguished volcanoes of the Lipari Islands. Their honey is, I think, the highest flavoured I have ever seen; in some parts of the island even superior to that of Minorca: this is owing, no doubt, to the quantity of aromatic plants with which this beautiful country is every where overspread. This honey is gathered three months in the year—July, August, and October. It is found by the peasants in the hollows of trees and rocks, and is esteemed of a superior quality to that produced under the tyranny of man. The country of the Lesser Hybla is still, as formerly, the part of the island that is most celebrated for honey. The Count Statela made us a present of some of it, gathered on his brother the Prince Spaccaforno's estate, which lies near the ruins of that city.

Sugar is now no article of the Sicilian commerce, though a small quantity of it is still manufactured for home consumption; but the plantations of the sugarcane, I am told, thrive well in several parts of the island.

The juice of liquorice is prepared both here and in Calabria, and is sent to the northern countries of Europe, where it is used for colds. The juice is squeezed out of the roots, after which it is boiled to a consistency, and formed into cakes, which are packed up with bay leaves in the same order that we receive them.

In some of the northern parts of the island, I am told, they find the shell-fish that produces a kind of flax, of which gloves and stockings are made; but these, too, are found in greater quantities in Calabria.

Their plantations of oranges, lemons, bergamots, almonds, &c., produce no inconsiderable branch of commerce. The pistachio-nut, too, is much cultivated in many parts of the island, and with great success. These trees, like many others, are male and female: the male is called *scornobecco*, and is always barren; but unless a quantity of these are mixed in every plantation, the pistachio-tree never bears a nut. But of all the variety that is cultivated in Sicily, the manna-tree is esteemed the most profitable; it resembles the ash, and is, I believe, of that species. About the beginning of August, during the season of the greatest heat, they make an incision in the bark, near to the root of the tree; a thick whitish liquor is

immediately discharged from the wound, which soon hardens in the sun, when it is carefully taken off and gathered into boxes. They renew these incisions every day during the season, observing, however, only to wound one side of the tree; the other side they reserve for the summer following.

The cantharides-fly is a Sicilian commodity; it is found on several trees of Ætna, whose juice is supposed to have a corrosive or abstersive quality, particularly the pine and the fig-tree; and I am told the cantharides of Mount Ætna are reckoned preferable to those of Spain.

The marbles of Sicily would afford a great source of opulence, were there any encouragement to work the quarries: of these they have an infinite variety, and of the finest sorts. I have seen some of them little inferior to the giall' and verd antique, that is now so precious. The beautiful yellow columns you must have observed in the royal chapel of Casserto are of the first kind. They have likewise some that very much resemble lapis lazuli and porphyry.

At Centorbi they find a kind of soft stone that dissolves in water, and is used in washing instead of soap, from which property it is called *pietra saponaro*. They likewise find here, as well as in Calabria, the celebrated stone, which, upon being watered and exposed to a pretty violent degree of heat, produces a plentiful crop of mushrooms. But it would be endless to give you an account of all the various commodities and curious productions of this island; Ætna alone affords a greater number than many of the most extensive kingdoms, and is no less an epitome of the whole earth in its soil and climate, than in the variety of its productions. Besides the corn, the wine, the oil, the silk, the spice, and delicious fruits of its lower region—the beautiful forests, the flocks, the game, the tar, the cork, the honey, of its second—the snow and ice of its third—it affords from its caverns a variety of mineral and other productions—cinnabar, mercury, sulphur, alum, nitre, and vitriol; so that this wonderful mountain at the same time produces every necessary and every luxury of life.

Its first region covers their tables with all the delicacies that the earth produces; its second supplies them with game, cheese, butter, honey, and not only furnishes wood of every kind for building their ships and houses, but likewise an inexhaustible store of excellent fuel; and as the third region, with its ice and snow, keeps them fresh and cool during the heat of summer, so this contributes equally to keep them warm and comfortable during the cold of winter.

Thus you see the variety of climates is not confined to Ætna itself; but, in obedience to the voice of man, descends from that mountain, and, mingling the violence of their extremes, diffuses the most benign influences all over the island, tempering each other to moderation, and softening the rigours of every season.

We are not then to be surprised at the obstinate attachment of the people to this mountain, and that all his terrors have not been able to drive them away from him: for, although he sometimes chastises, yet, like an indulgent parent, he mixes such blessings along with his chastisements that their affections can never be estranged; for at the same time that he threatens with a rod of iron, he pours down upon them all the blessings of the age of gold.

Adieu. We are now going to pay our respects to the viceroy, and make our farewell visits. This ceremony never fails to throw a damp on my spirits; but I have seldom found it so strong as at present, there being little or no probability that we shall ever see again a number of worthy people we are just now going to take leave of, or that we shall ever have it in our power to make any return for the many civilities we have received from them.

Farewell. The wind, we are told, is fair, and I shall probably be the bearer of this to the continent, from whence you may soon expect to hear from me.

## RETURN TO NAPLES.—CONCLUSION.

*Naples, August 1.*

AFTER two days' delightful sailing, we have again arrived in this city, where, to our infinite joy, we have found all the worthy friends we had left behind us. This indeed was necessary to wipe out the impressions which the leaving of Sicily had occasioned. We shall still remain here at least for three months, till the season of the *malaria* is entirely over. You know the danger of travelling through the Campania during that season; and although this is looked upon by many of our learned doctors as a vulgar error, we certainly shall not submit ourselves to the experiment.

We propose to pass the winter at Rome, where we shall probably find occupation enough for four or five months. From thence by Lorretto, Bologna, &c., to Venice, the old beaten tract. We shall then leave the parched fields of Italy for the delightful cool mountains of Switzerland, where liberty and simplicity, long since banished from polished nations, still flourish in their original purity—where the temperature and moderation of the climate and that of the inhabitants are mutually emblematical of each other. For whilst other nations are scorched by the heat of the sun, and the still more scorching heats of tyranny and superstitution, here the genial breezes for ever fan the air, and heighten that alacrity and joy which liberty and innocence alone can inspire; here the genial flow of the soul has never yet been checked by the idle and useless refinements of art, but opens and expands

itself to all the calls of affection and benevolence. But I must stop. You know my old attachment to that primitive country. It never fails to run away with me. We propose, then, to make this the scene of our summer pleasures; and by that time, I can foresee, we shall be heartily tired of art, and shall begin again to languish after nature. It is she alone that can give any real or lasting pleasure, and in all our pursuits of happiness, if she is not our guide, we never can attain our end.

Adieu, my dear friend. You have been our faithful companion during this tour, and have not contributed a little to its pleasure. If it has afforded equal entertainment to you, we shall beg of you still to accompany us through the rest of our travels. A man must have a miserable imagination indeed, that can be in solitude whilst he has such friends to converse with; the consideration of it soon removes the mountains and seas that separate us, and produces those sympathetic feelings, which are the only equivalent for the real absence of a friend: for I never sit down to write but I see you placed on the opposite side of the table, and suppose that we are just talking over the transactions of the day. And without your presence to animate me, how is it possible that I could have had patience to write these enormous epistles? Adieu. We are soon going to make some excursions through the kingdom of Naples, and if they produce any thing worthy of your observation, we must beg that you will still submit to be one of the party. I ever am, most sincerely and affectionately yours,

PAT. BRYDONE.

## APPENDIX.

## MOUNT ÆTNA.

ONE of the latest accounts which have been given of an ascent of Mount Ætna, is that of Sidney L. Johnson, a gentleman filling the situation of teacher on board one of the vessels of the United States' squadron in the Mediterranean. The year in which the visit was made, we should suppose to have been 1834 or 1835. The following is Mr Johnson's account, slightly abridged, and it may be compared with that given by Brydone:—

"A wish to ascend Mount Ætna was at first the chief motive of our visit to Catania; but before departure, our hopes of reaching the summit were somewhat diminished. Since the snow fell, several parties had attempted it, but all without success. We often gazed upon it from our ships in the harbour of Syracuse, where it presented the singular appearance of a perfect cone of snow of astounding size, to whose dazzling whiteness, the vertex, tipped with black and tufted with a graceful plume of smoke, afforded the only relief. From the more commanding heights of Epipolæ, we could trace the sides lower down; the skirts of the snow were dappled with the naked patches of dark rock, then disappeared, and the broad green base presented a cheerful contrast to the cold and glittering summit.

Our arrangements were made for riding up as far as Nicolosi, on the 22d of February. Abbate, our landlord, had provided every necessary refreshment; and with a due supply of extra clothing, we mounted, and were in motion by four P. M. Our party consisted of four, and was guided to the resting-place for the night by our humorous and obliging host. A few steps brought us from the hotel in the Corso to the Strada Ætnæa. These are the two finest streets of Catania, the former stretching from the sea to the west, quite through the city; the latter cutting it at right angles, and running towards the mountain from which it is named. As we turned the corner into this street, it

seemed to extend nearly the whole of the route which we were to take, that is, to a distance of thirty miles, and with a continuous ascent, to the elevation of ten thousand feet.

Sallying from the city, by a cottage delightfully situated at the extremity of the street, we followed, for the first six miles, the new and excellent carriage-road leading to Messina. We passed through a toll-gate, and it struck me as the first I had seen out of my own country. Two or three villages skirted the first part of the way with houses, and these, with the fields and vineyards, evinced a more thriving and happy population than we had noticed elsewhere in Sicily. Shortly after leaving the city, Abbate told us we were passing over the port of Ulysses. It had been completely filled up by lava at an unknown period; that of Catania, on the other hand, owes its formation to the eruption of 1669. We dismounted, and went a short distance from the road, to see an extinct crater. It must be a very ancient one; it presented the appearance of an irregular bowl, not more than two rods in diameter at the brim, and with a small jagged orifice at the bottom; stones were dropped into this, and the sounds indicated frequent collision with the sides of the cavity, and but a trifling perpendicular descent.

About six o'clock we reached the village of Nicolosi, after an up-hill ride of twelve miles; and in an inn at this place we stayed during the night. Between two and three o'clock in the morning, the faithful Abbate aroused us with the news that every thing was favourable, that the night was clear and calm, and that a bright moon would aid us in riding over the broken lava. In midwinter it is all important to regard the state of the weather in ascending Ætna. A high wind and drifting clouds of snow render the attempt always futile, and often dangerous. Having partaken of an excellent cup of hot coffee, and bundled ourselves well with coats and cloaks, caps and moccasins, we mounted, and by half-past three our mules were mov-

ing slowly to the hearty thwacks upon their hides from the muleteers' cudgels. Two guides accompanied us, to enable any of the party to return, if necessary, without frustrating the rest. By the light of the moon we could see that our road was over dark scoriæ, or fragments of lava. On entering the Bosco, or wooded region, small patches of snow began to appear, which rapidly increased in number and extent until they formed one continuous sheet. Our mules were soon floundering in it, and at six o'clock we were forced to dismount. The thermometer stood at 28 degrees. Half an hour's walk on the crust of the snow brought us to the solitary hut called the 'casa della neve.' The smoke was issuing in volumes through the door and numerous apertures in the roof. A peasant from Nicolosi had kindled a fire before our arrival.

We stopped but a few moments outside the 'casa della neve,' for the smoke precluded our entering it, and we did not wish to breakfast; so, throwing off our cloaks, with a roll of bread in our pockets, and more substantial fare in the knapsacks of our guides, we advanced, and sallying from the Bosco, saw the sun, then apparently about half an hour high. The thermometer at the 'casa della neve' was at 27 degrees, but it rose, from the effect of the sun as we ascended, to above 32 degrees.

Between nine and ten o'clock, Dr H. was obliged to return with one of our guides: with the other we proceeded until we reached a stone pile of a pyramidal form, distant one hour and a quarter from a place called the English house, which the guide now described before us. The ascent was here peculiarly laborious. A hard and slippery crust on the snow, together with the acclivity of the mountain, obliged us to turn our feet outward, and stamp firmly with the inner edge of the sole of our boots, in order to make some footing; this was excessively painful, particularly to the ankle joints: in some places, on the other hand, the snow was soft, and lifting the foot from its deep bed to take another step was the most trying part of the labour; it was a pain caused by this which had exhausted the doctor. We halted to rest our limbs and to enjoy the prospect, which was increasing in grandeur with every step. Several times we threw ourselves at full length on the snow, and felt in all its luxury that exquisite sensation of pleasure which attends the rapid recovery of the body from the fatigue of intense exertion. We rose above the level of Mount Agnola, which we left to the right, and at ten minutes before noon we reached the English house, which was so buried in snow that we could not enter it, although we had obtained the keys for that purpose.

We here saw ourselves far above points, which, when we issued from the Bosco, appeared but little below the summit. The side of the mountain is covered with conical protuberances, whose hollow tops prove them to be the craters or vents of some previous eruptions. The snow was broken, in some few places, by black jutting rocks of lava. Our guides pointed out several wolf tracks, and one of a hare. At a quarter past twelve, we started to ascend the cone, between which and the English house was a space nearly level; on the other side of it, the snow which we had seen sprinkled with ashes some time before, now became dirty, soon black; and after ascending the cone a little way, was succeeded by loose stones and cinders. From these, a hot, sulphurous, suffocating vapour, was steaming; our feet soon felt the change, and from being very cold became very warm. The ascent was steep, and peculiarly difficult, from the loose stones and cinders yielding under the feet; the vapour, moreover, was so dense that we could see but a short distance. The wind was from the north-east, and by moving a little in that direction, we were partially relieved from the fumes. We were infinitely relieved, soon after, by seeing the desired point but a short distance above us. Another struggle, and we

were on the summit of Mount *Ætna*, at half-past one o'clock on the 23d of February. My fatigue vanished. I felt a glow of satisfaction from the simple attainment of my object, before I had time to look around for any other reward.

The crater first attracted my attention; we stood on a point to the north and east of it, in the best situation to view it, as the wind was northerly, and carried away from us the clouds of vapour. Its form is very much altered within a few years by the ejection of scoriæ and other matter; and the highest point of the mountain, where we then stood, occupies the centre of the old crater. Volumes of steam, smoke, and ashes, were constantly pouring forth from the chasm; the eye sought in vain to fathom its depth, and the last sound of the fragments of lava thrown down indicated that they were still in motion towards their former bed of fire. There was no flame visible, but the vapour and the ground on which we stood were very hot, although the air was so cold that the thermometer held in it, breast high, sunk to a little below 22 degrees Fahrenheit. The vapour was strongly impregnated with sulphur, and fine crystals of the same coated the fragments of lava and other volcanic substances where we stood. The whole surface of the cone consisted of these loose and crumbling materials, and gases seemed to issue from every part, as if the whole were porous. We picked up several specimens for our guide to bring down.

But our eyes were wandering from these more immediate observations to the magnificent panorama which the isolated situation of the peak renders peculiarly grand and entire. On every side, except in the direction of Italy, the view was bounded by sea and sky. The base of *Ætna* floated in the lower hemisphere; but its apex soared far into the regions of the upper, and on it one might almost fancy the heavens nearer than the earth, and wish to start from such vantage ground on his flight to another world. Sicily was reduced to a map which we could study far beneath us. Almost under our feet lay Catania, and the villages which sprinkled the mountain's base. Farther off to the south, Augusta and Magnesia jutted out into the sea, and beyond were distinctly seen Ortygia and Plemmyrium, and the black specks in the beautiful round basin of Syracuse we knew to be the ships of our squadron. The eye wandered on to Cape Passaro, and following the course of *Æneas's* fleet by the Geloan fields and Agrigentum, rested on the blue sea beyond Lilybeum and Mount Eryx.

Unfortunately we had left behind our ship telescope, and the small one which was politely lent us by Signor Gemmellaro, would hardly compensate for longer stay in the freezing air and burning cinders of the 'Sommo Cratere.'

A few minutes before two, we began our descent. The philosopher's tower was pointed out on the left of the English house; tradition says that it was built by Empedocles, and thence received its present name. At a quarter past two P.M. we were at the English house. An immense, rich-looking cloud, of a whitish colour, lay far below us, floating like a canopy over Catania and its plain: it seemed to have gathered while we were busy in our observations on the crater or more distant objects, or rather to have become developed in the atmosphere almost instantaneously. Stopping a few minutes to enjoy this novel and magnificent sight, we refreshed ourselves with a modicum of wine, and descended to the 'casa della neve' in less than an hour, over what had cost us six of the most painful exertion in the ascent.

A motion so rapid, and yet so easy, I never achieved on my own legs before, for so great a distance; we rather bounded than ran down. The snow had become so softened by the sun that we sunk at every step, but only enough in most cases to enable us to check and regulate the speed which gravity created. If our feet were plunged too deeply, head and shoulders

were equally so, with a jerk which threatened to snap the knee-joints, and we stuck like a raspberry vine planted at both ends. A slip was less dangerous, as it did not stop our momentum all at once, nor until we had first ploughed a handsome furrow in the snow. Notwithstanding these mishaps, nothing could be more exhilarating than the leaps by which we descended to the common level of mankind.

We found the doctor philosophically consoling himself for the unseen wonders of the crater, over a bright fire in the snow house, which was kept blazing and crackling by the trees of the Bosco. Our horses being found farther on, we lost no time in regaining our inn at Nicolosi. Here, although fatigue and hunger counselled us to stop, yet we chose rather to bear them two or three hours longer, than to try again the miserable pallets of the night before. We therefore, with as little delay as possible, resumed our route to Catania, and arrived there at nine o'clock. Though we had eaten nothing during the day but a spare breakfast, yet repose was demanded more imperiously than food; a generous supper awaited our return, but swallowing only some warm broth, we left every thing to throw ourselves into that sweet oblivion which could alone restore us."

### MALTA.

THE following account of Malta, by a traveller who visited it in 1840, originally published in *Chambers's Journal*, may here be appended:—

"Since the establishment of the route by Egypt to India, the island of Malta has a prospect of again becoming a place of great importance, to merchants at least, and travellers. It lies half way between the plague and pestilences of the East and the salubrity of the more fortunate West, and is used as a testing or purifying station, to secure the latter regions from the influx of the diseases peculiar to the former. No steamers from Smyrna, Athens, Constantinople, or any other port east of Malta, can pass the island without touching at it, and undergoing quarantine and purification in one of its harbours devoted to this purpose. Such an arrangement is obviously highly necessary, if not indispensable.

The steamers from England usually sail on the first of the month. They reach Gibraltar in ten days; the steamers from Gibraltar arrive at Malta in a little less than the same time; and the voyage between Malta and Alexandria occupies also between seven and ten days; so that a person from England may reach Alexandria in from twenty-seven to thirty days. Of course, the voyage backwards cannot be so quickly performed, as a quarantine of from ten to twenty days must be then undergone. There are, even at the present time, numerous steamers and other vessels to be usually found at Malta, both government and company property, English and French, Austrian, Tuscan, and Turkish; for even the pennant of the Ottomans is now to be seen flying from the mast of a '*tchek-jeemie*,' as they call that noble product of man's ingenuity, the steam-boat.

Malta lies in the centre of the Mediterranean, holding much the same relation to Europe, Asia, and Africa, that the Isle of Man does to the three countries bordering St George's Channel. There was long a dispute whether it was in Europe or Africa, but the British parliament at last ended the matter by declaring it to be in Europe. Near to Malta is another small island called Gozo, which is generally included when speaking of Malta, as if it were a suburb of a large city. The extreme length of Malta is about sixteen miles, and the extreme breadth eleven; it has, however, a great many jutting points or capes, and is computed to contain 170 square miles, upon which it is said there are 123,000 inhabitants, 5000 beasts of burden, 6000 horned cattle, 8000 sheep, and 12,000

goats; consequently it is one of the most densely populated places in the world. About one-half of the land is cultivated, and produces cotton and grain, with a plentiful supply of vegetables and fruit, and especially oranges, which are said to be the finest in the world. The annual value of the cotton raised is about one hundred thousand pounds, but the grain is not sufficient for even one-third of the inhabitants; consequently, there is a great trade carried on in grain from the Black Sea, which is admitted at a variable duty, averaging about a third of its wholesale cost in the island.

There is little or no other produce in Malta equal in any way to its capabilities, whether as regards the climate or population. It is true that there is a trade to a very limited extent in the manufacture and sale of cotton sailcloth, napkins, table-cloths, shirts, cotton yarn spun by hand, gold and silver trinkets, iron-posted bedsteads, rush-bottomed chairs, and cigars; but labour is so cheap, and the amount of work done in any of these departments so small, that the people are not half employed.

The wages of workmen are small, but rent and living are remarkably cheap. Malta is undoubtedly the cheapest place in Europe; for there a working man can easily support himself and family on from 6d. to 8d. per day, and considers himself fortunate if he can make that sum regularly.

Besides villages, Malta has four towns, namely, Valetta, which is the capital, Floriana, Victoroso, and Civitta Vecchia. Nothing strikes a stranger more on entering the capital, than the shelving nature of the streets, which ascend and descend in many parts by stairs. He will also be struck with the immense number of idle people hovering around him, and chattering in all the languages of Europe. The greater part of these are beggars, and the others candidates for the honour of being his guides, an office into which several will instal themselves, and then quarrel which of them has been employed. It is of no use that the first class are told that they will get nothing, and the second, that their services are not wanted; they will, with the most cool and pertinacious impudence, *tröt along* (for in such cases they rarely walk) before, behind, and on every side of their victim; neither is it of any use to get angry at them, as, if they are scolded, they will throw up their hands and eyes with the air of ill-used people, and commence talking loud and long, proving to each other's satisfaction, and the torment of their victim, that they are deprived of their just rights. The only method of getting rid of them is to walk on, taking no notice of any one until the tail gets too large to be at all manageable, and then take refuge in a café, round the door of which they will probably hover for a few minutes, but soon depart to look after another stranger. If this course of silent non-recognition be followed, the cortège will daily diminish in number; and if the stranger has given none of them any money, then in about four days he will be left entirely without any escort, and in future be only troubled by the beggars. If, however, he has been so ill advised as to give away even a penny on his first coming to the island, his term of annoyance will be much increased, and his followers as plentiful as the serfs of a Celtic chief in the olden time.

The island is strongly fortified, and garrisoned by about 4000 men, nearly one-fourth of that number being native troops, under native officers. The capital is built upon a tongue of land which stretches out between the clean and quarantine harbours. The streets all run at right angles, whether on the plain or the hill. The city may be about half a mile long, and a sixth part broad: the shops are not numerous, and the greater portion of them are used as cafés, wine shops, and provision stores, in front of which, and in many cases stretching out to the centre of the street, the goods are piled in great quantities, as also fruit, vegetables, and all sorts of food, which are sold at very

low prices. In summer, business is not transacted between eleven o'clock forenoon and four o'clock afternoon, on account of the great heat of the sun; during which cessation of labour, all the better part of the inhabitants are in their houses, and the mass of the common classes lying asleep on the shady side of the street, or wherever they can escape from the sun.

There are many public buildings in Malta deserving of notice, especially the palace of the ancient grand masters, and the chapel of the knightly order of St John. There is also a most splendid library, which belonged to the knights, in existence at the present day, beautifully arranged, and well catalogued by the native librarian, who appears to understand his business as well as if he had been brought up in Paternoster Row. There is likewise a large library of modern books called 'the Garrison Library,' in the same building. This library receives from England all new works of interest, the greater part of the leading periodicals, and several newspapers. The regulations are exceedingly liberal, as a stranger coming to Malta with a letter of introduction to any respectable person, would find no difficulty in having the free use of all contained in both libraries.

About half a mile from Valetta stands Floriana, which contains a few streets of rather a miserable order. In an opposite direction is situated Victoroso, where the admiralty offices and stores are all placed, and where the different officers connected with this department have elegant houses bordering upon the sea. The town is very dirty, and consists for the most part of streets of steep stairs ascending to the battlements, where, if the sun is shining, thousands of lizards may be seen sporting themselves in its rays, emerging from the crevices, and concealing themselves again with the speed almost of lightning. Civitta Vecchia is distant from Valetta about five miles. It is the ancient capital of the island, and the oldest city in it, but, on account of the better situation of Valetta for defence and commerce, has lost its rank and importance.

The boatmen of Malta are a most troublesome set of fellows, as, if the traveller walks along any part of the town which leads to the shore, he is certain to be assailed by a number of them, all insisting on the employment of one boat in preference to another; and even although they are told that a boat is not wanted at all, still they will follow until they conduct the stranger along the shore beyond the boat station. The number of these men exceeds three thousand, and they possess about eleven hundred boats. The usual fare from any one place in the island to another, or to any vessel in the harbour, is 2d., but these rascals insist sometimes upon strangers giving them a *dollar*; even a bargain is never held sacred, as, when the work is finished, they are sure to insist on double or three times the stipulated sum. The only way to manage them is to throw the money down on the street, and walk away; it is true they will follow their *fare* half way over the town; but the thing is so common, that nobody takes any notice of a stranger followed by one or two Maltese boatmen, calling out for money alleged to be due for service performed.

The language of the Maltese is of a very strange character, being a mixture of the Arabic and Italian, but containing most of the former. Nearly all the people, however, can speak a little bad Italian, but very few of the lower or middle classes understand any English, saving a few words of every-day occurrence. The habits and manners of the people are also

a mixture of the rude Moorish and smooth Italian. Altogether, they may be said to be one of the most disagreeable and roguish races of people on earth. Of honesty or fair dealing they have no idea, and nothing is too small for them to seize upon and carry off. Even their smallest coin, which is the twelfth part of a penny, will not be disregarded if there is a means of obtaining it, without an adequate return being given. Throughout the Levant they have a notoriously bad name, and at Alexandria and Constantinople are proverbial for their robberies, and even murders, thereby causing the British consuls at these places ten times more trouble than all the other subjects of the British empire.

The females of Malta are celebrated for their large black eyes, but in other respects they have not the beauty of either the Spanish or Italian dames. The dress of the lowest class is slovenly and dirty; that of the middle class is neat, and generally white within doors in summer; but on the street the white gown is covered with a black silk skirt, while a black silk scarf, called *faldetta*, is thrown over the head and shoulders, and disposed in such a manner as to show the countenance of the wearer in the most favourable semi-nudity, and is nothing more than a western garment worn in an eastern fashion. The upper class of females in Malta are rarely to be seen on the street; they, however, dress like the English and French, after the latest European fashions.

From the number of priests and friars who crowd the streets, one might easily tell, even if the conduct of the inhabitants did not proclaim it, that Malta is a place where the church is all-powerful. But however much the diffusion of knowledge may have extended to other places, certainly the schoolmaster has not been here, for old and young are living in the most complete ignorance. Education is entirely in the hands of the priests, who have the exclusive management of the College, or School of Instruction, and it is practically of little use to the people.

The press, as may well be supposed, is in a very poor state indeed, where the people are so sunk in ignorance; but it will hardly be credited that it is so low as it really is. Until within eighteen months, there was no printing-press permitted in the island but that of the government, from which issued a small newspaper, once a-week, under the name of the 'Malta Gazette.' It appeared in parallel columns, English and Italian, but contained no original political articles—being made up of extracts from the London, Paris, and other newspapers of an old date; and yet, though this was the only channel in Malta of receiving news of what was passing in the world, previous to the granting the liberty of the press, it never had a circulation of more than three hundred.

Since the press has become free, there have been started two Italian newspapers in Valetta, one of them entitled 'Portofoglio Maltese,' and the other 'Il Spettatore Imparziale,' but there is nothing in their columns worthy of special notice. A third newspaper, in English and Italian, has also been started, under the name of 'Il Gazzetto del Mediterraneo.' It is decidedly the most clever that has ever appeared in Malta, but, it is to be feared, will sink for want of support. The Maltese care for almost nothing beyond the day or hour in which they live; a newspaper is of no interest or use to them; and until they are better educated, or some great change takes place among them, the liberty of the press will not be either valued or supported."

## END OF TOUR THROUGH SICILY AND MALTA.

INCIDENTS OF TRAVEL

## PREFATORY NOTICE.

THE present work, which appeared originally in the United States of America, where it soon passed through six editions, has been already made favourably known in Britain, and now occupies a place among the most respectable publications of the day. To the sixth American edition, of which this is a faithful reprint, the following preface is prefixed by the author:—

“The preface of a book is seldom read, or the author would express his acknowledgments to the public for having so soon demanded a sixth edition of his work. If the sale of a book be any evidence of its merit, he has reason to believe that his subject matter has been interesting, and his manner of treating it not unacceptable. He has, too, a deeper source of satisfaction; for he cannot help flattering himself that he has been, in some degree, instrumental in turning the attention of his countrymen to subjects comparatively little known; and, in addition, he can only say, as before, that in the present state of the world it is almost presumptuous to put forth a book of travels. Universal peace and extended commercial relations, the introduction of steam-boats, and increased facilities of travelling generally, have brought comparatively close together the most distant parts of the world; and except within the walls of China, there are few countries which have not been visited and written upon by European travellers. The author’s route, however, is comparatively new to the most of his countrymen; part of it—through the land of Edom—is, even at this day, entirely new. The author has compiled these pages from brief notes and recollections, and has probably fallen into errors in facts and impressions, which his occupations since his return have prevented his inquiring into and correcting. He has presented things as they struck his mind, without perplexing himself with any deep speculations upon the rise and fall of empires; nor has he gone much into detail in regard to ruins. His object has been, principally, as the title of the book imports, to give a narrative of the every-day incidents that occur to a traveller in the East, and to present to his countrymen, in the midst of the hurry, and bustle, and life, and energy, and daily-developing strength and resources of the New, a picture of the widely different scenes that are now passing in the faded and worn-out kingdoms of the Old World.”

# INCIDENTS OF TRAVEL

IN

## EGYPT, ARABIA PETRÆA, &c.

### CHAPTER I.

Alexandria.—Pompey's Pillar.—The Catacombs.—The Warwick Vase.—The Pacha's Canal.—Boats of the Nile.

On the afternoon of the — December, 1835, after a passage of five days from Malta, I was perched up in the rigging of an English schooner, spyglass in hand, and earnestly looking for the "land of Egypt." The captain had never been there before; but we had been running several hours along the low coast of Barbary, and the chart and compass told us that we could not be far from the fallen city of Alexander. Night came on, however, without our seeing it. The ancient Pharos, the Lantern of Ptolemy, the eighth wonder of the world, no longer throws its light far over the bosom of the sea to guide the weary mariner. Morning came, and we found ourselves directly opposite the city, the shipping in the outward harbour, and the fleet of the pacha riding at anchor under the walls of the seraglio, carrying me back in imagination to the days of the Macedonian conqueror, of Cleopatra and the Ptolemies. Slowly we worked our way up the difficult and dangerous channel, unaided by a pilot, for none appeared to take us in charge. It is a fact worthy of note, that one of the monuments of Egypt's proudest days, the celebrated Pompey's Pillar, is even now, after a lapse of more than 2000 years, one of the landmarks which guide the sailor to her fallen capital. Just as we had passed the last reef, pilots came out to meet us, their swarthy faces, their turbans, their large dresses streaming in the wind, and their little boat with its huge latteen sail, giving a strange wildness to their appearance, the effect of which was not a little heightened by their noise and confusion in attempting to come alongside. Failing in their first endeavour, our captain gave them no assistance; and when they came upon us again, he refused to admit them on board. The last arrival at Malta had brought unfavourable accounts of the plague, and he was unwilling to run any risk until he should have an opportunity of advising with his consignee. My servant was the only person on board who could speak Arabic; and telling the wild, fly-away looking Arabs to fasten on a stern, we towed our pilots in, and at about eight o'clock came to anchor in the harbour. In half an hour I was ashore; and the moment I touched it, just as I had found at Constantinople, all the illusion of the distant view was gone.

Indeed, it would be difficult for any man who lives at all among the things of this world to dream of the departed glory of Egypt when first entering the fallen city of Alexander; the present, and the things of the present, are uppermost; and between ambling donkeys, loaded camels, dirty, half-naked, sore-eyed Arabs, swarms of flies, yelping dogs, and apprehensions of the plague, one thinks more of his own movements than of the pyramids. I groped my way through a long range of bazaars to the Frank quarter, and here, totally forgetting what I had come for, and that there were such

things as obelisks, pyramids, and ruined temples, the genius of my native land broke out, and with an eye that had had some experience in such matters at home, I contemplated the "improvements?" a whole street of shops, kept by Europeans and filled with European goods, ranges of fine buildings, fine country houses, and gardens growing upon barren sands, showed that strangers from a once barbarous land were repaying the debt which the world owes to the mother of arts, and raising her from the ruin into which she had been plunged by years of misrule and anarchy.

My first visit was to Mr Gliddon, the American consul, whose reception of me was such, that I felt already as one not alone in a strange land. While with him, an English gentleman came in—a merchant in Alexandria—who was going that night to Cairo. Mr Gliddon introduced us; and telling him that I, too, was bound for Cairo, Mr T. immediately proposed that I should accompany him, saying he had a boat and every thing ready, and that I might save myself the trouble of making any preparations, and would have nothing to do but come on board with my luggage at sundown. Though rather a short notice, I did not hesitate to accept his offer. Besides the relief from trouble in fitting out, the plague was in every one's mouth, and I was not sorry to have so early an opportunity of escaping from a city, where, above all others, "pestilence walketh in darkness, and destruction wasteth at noonday."

Having but a short time before me, I immediately mounted a donkey—an Egyptian donkey—being an animal entirely unknown to us, or even in Europe, and, accompanied by my servant, with a sore-eyed Arab boy to drive us, I started off upon a full gallop to make a hasty survey of the ruins of Alexandria. The Frank quarter is the extreme part of the city, and a very short ride brought us into another world. It was not until now, riding in the suburbs upon burning sands, and under a burning sun, that I felt myself really in the land of Egypt. It was not, in fact, till standing at the base of Pompey's Pillar, that I felt myself among the ruins of one of the greatest cities of the world. Reaching it through long rows of Arab huts, where poverty, and misery, and famine, and nakedness, stared me in the face, one glance at its majestic height told me that this was indeed the work of other men and other times. Standing on a gentle elevation, it rises a single shaft of ninety feet, and ten feet in diameter, surmounted by a Corinthian capital, ten feet high, and, independent of its own monumental beauty, it is an interesting object as marking the centre of the ancient city. It stands far outside the present walls, and from its base you may look over a barren waste of sand, running from the shores of the Mediterranean to the Lake Mareotis, the boundaries of Alexandria as it was of old.

All this intermediate space of sandy hills, alternating with hollows, was once covered with houses, palaces, and perhaps with monuments equal in beauty to that at whose base I stood. Riding over that

waste, the stranger sees broken columns, crumbling walls, and fragments of granite and marble, thrusting themselves above their sandy graves, as if struggling for resurrection; on one side he beholds a yawning chasm, in which forty or fifty naked Arabs are toiling to disinter a column long buried in the sand; on another an excavated house, with all its walls and apartments almost as entire as when the ancient Egyptian left it. He is riding over a mighty sepulchre, the sepulchre of a ruined city, and at every step some tell-tale monument is staring at him from the grave.

Riding slowly among the ruins, I passed the celebrated wells built in the time of Alexander, at the very foundation of the city, at which generation after generation have continued to slake their thirst, and ended my ride at Cleopatra's Needle, a beautiful obelisk sixty feet high, full of mysterious hieroglyphics that mock the learning of the wise of our day. Time has dealt lightly with it; on one side the characters stand bold and clear as when it came from the hands of the sculptor, although, on the other, the dread sirocco, blowing upon it from the desert more than 2000 years, has effaced the sculptor's marks, and worn away the almost impenetrable granite. By its side, half buried in the sand, lies a fallen brother, of the same size, and about the same age, said to have been taken down by the English many years ago, for the purpose of being carried to England; but the pacha prevented it, and since that time it has lain in fallen majesty, stretching across a deep chasm formed by excavations around it.

At six o'clock I was riding with my new friend, spurring my donkey to its utmost to get out of the city before the gate should close; and my reader will acquit me of all intention of writing a book, when I tell him that a little after dark of the same day on which I arrived at Alexandria, I was on my way to Cairo. Accident, however, very unexpectedly brought me again to Alexandria; and on my second visit, while waiting for an opportunity to return to Europe, I several times went over the same ground more at my leisure, and visited the other objects of interest which my haste had before prevented me from seeing.

Among these were the Catacombs, situated about two miles from the city, on the edge of the Libyan Desert, and near the shore of the sea. These great repositories of the dead are so little known that we had some difficulty in finding them, although we inquired of every body whom we met. Seeing an Arab brushing some horses near an opening in the side of the rock, we went to him to inquire, and found we were at the door of the Catacombs. The real entrance is now unknown, but was probably from above. The present is a rude forced breach, and the first chamber into which we entered, a chamber built with pious regard to the repose of the dead, we found occupied as a stable for the horses of one of the pacha's regiments. My donkey-boy had taken the precaution to bring with him candles, and a line to tie at the entrance, after the manner of Fair Rosamond's elue, to save us from being lost in the labyrinth of passages; but the latter was unnecessary, as the Arabs employed about the horses had explored them so thoroughly for purposes of plunder, that they were sufficiently sure guides. Taking two of them into pay, we followed with our lighted torches through two chambers, which, to me, who had then seen the tombs in Thebes, Petra, and Jerusalem, contained nothing remarkable, and came to what has been called the state chamber, a circular room about thirty feet in diameter, with three recesses, one at each side of the door and one opposite, a vaulted roof, and altogether admirably fine in its proportions. In each of the recesses were niches for the bodies of the dead, and in one of them skulls and mouldering bones were still lying on the ground. Following my guides, I passed through several chambers half filled with sand; but having by this time lost much of my ardour for wandering among tombs, and finding the pursuit unprofitable and unsatisfactory, I returned to the state chamber and left the Catacombs.

They are supposed to extend many miles under the surface, but how far will probably never be known. The excavations that have as yet been made are very trifling; and unless the enlightened pacha should need the state chamber for his horses, the sands of the desert may again creep upon them, and shut them for ever from our eyes.

Near the door of the entrance, directly on the edge of the shore, are chambers cut in the rocks, which open to the sea, called by the imposing name of Cleopatra's Baths. It is rather an exposed situation, and, besides the view from the sea, there are several places where "peeping Tom" might have hidden himself. It is a rude place, too; and when I was there, the luxurious queen could hardly have got to her chambers without at least wetting her royal feet; in fact, not to be imposed upon by names, a lady of the present day can have a more desirable bath for a quarter of a dollar than ever the Queen of the East had in her life.

The present city of Alexandria, even after the dreadful ravages made by the plague in 1837, is still supposed to contain more than 50,000 inhabitants, and is decidedly growing. It stands outside the delta in the Libyan Desert, and as Volney remarks, "It is only by the canal which conducts the waters of the Nile into the reservoirs in the time of inundation that Alexandria can be considered as connected with Egypt." Founded by Alexander, to secure his conquests in the East, being the only safe harbour along the coasts of Syria or Africa, and possessing peculiar commercial advantages, it soon grew into a giant city. Fifteen miles in circumference, containing a population of 300,000 citizens and as many slaves, one magnificent street 2000 feet broad ran the whole length of the city, from the Gate of the Sea to the Canopic Gate, commanding a view, at each end, of the shipping, either in the Mediterranean or in the Mareotic Lake, and another of equal length intersected it at right angles; a spacious circus without the Canopic Gate for chariot-races, and on the east a splendid gymnasium, more than 600 feet in length, with theatres, baths, and all that could make it a desirable residence for a luxurious people. When it fell into the hands of the Saracens, according to the report of the Saracen general to the Calif Omar, "it was impossible to enumerate the variety of its riches and beauty; and it is said to "have contained 4000 palaces, 4000 baths, 400 theatres or public edifices, 12,000 shops, and 40,000 tributary Jews." From that time, like every thing else which falls into the hands of the Mussulman, it has been going to ruin, and the discovery of the passage to India by the Cape of Good Hope gave the death-blow to its commercial greatness. At present it stands a phenomenon in the history of a Turkish dominion. It appears once more to be raising its head from the dust. It remains to be seen whether this rise is the legitimate and permanent effect of a wise and politic government, combined with natural advantages, or whether the pacha is not forcing it to an unnatural elevation, at the expense, if not upon the ruins, of the rest of Egypt. It is almost presumptuous, on the threshold of my entrance into Egypt, to speculate upon the future condition of this interesting country; but it is clear that the pacha is determined to build up the city of Alexandria if he can: his fleet is here, his army, his arsenal, and his forts are here, and he has forced and centered here a commerce that was before divided between several places. Rosetta has lost more than two-thirds of its population, Damietta has become a mere nothing, and even Cairo the Grand has become tributary to what is called the regenerated city.

Alexandria has also been the scene of interesting events in modern days. Here the long-cherished animosity of France and England sought a new battlefield, as if conscious that the soil of Europe had too often been moistened with human blood. Twice I visited the spot where the gallant Abercrombie fell, about two miles outside the Rosetta Gate; the country was covered with a beautiful verdure, and the Arab

was turning up the ground with his plough; herds of buffalo were quietly grazing near, and a caravan of camels was slowly winding its way along the borders of a nameless lake, which empties into the Lake Mareotis. Farther on and near the sea is a large square enclosure, by some called the ruins of the palace of Cleopatra, by others the camp of Cæsar. This was the French position, and around it the battle was fought. All is quiet there now, though still the curious traveller may pick up from time to time balls, fragments of shells, or other instruments of death, which tell him that war, murderous and destructive war, has been there.

My last ride was to Pompey's Pillar. Chateaubriand requested a friend to write his name upon the great pyramid, not being able to go to it himself, and considering this one of the duties of a pious pilgrim; but I imagine that sentimental traveller did not mean it in the sense in which "Hero" and "Beatrice," and the less romantic name of "Susannah Wilson," are printed in great black letters, six inches long, about half way up the shaft.

There can be no doubt that immense treasures are still buried under the ruins of Alexandria; but whether they will ever be discovered will depend upon the pacha's necessities, as he may need the ruins of ancient temples for building forts or bridges. New discoveries are constantly made; and between my first and second visit a beautiful vase had been discovered, pronounced to be the original of the celebrated Warwick vase found at Adrian's villa, near Tivoli. It was then in the hands of the French consul, who told me he would not take its weight in gold for it. I have since seen the vase at Warwick Castle; and if the one found at Alexandria is not the original, it is certainly remarkable that two sculptors, one in Egypt and the other in Italy, conceived and fashioned two separate works of art so exactly resembling each other.

But to return to the moment of my first leaving Alexandria. At dark I was on board a boat at the mouth of the Mahmoudie, the canal which connects Alexandria with the Nile; my companion had made all necessary provision for the voyage, and I had nothing to do but select a place and spread my mattress and coverlet. In a few minutes we had commenced our journey on the canal, our boat towed by our Arab boatmen, each with a rope across his breast. I have heard this canal spoken of as one of the greatest works of modern days, and I have seen it referred to as such in the books of modern travellers; and some even, as if determined to keep themselves under a delusion in regard to every thing in Egypt, speak of it as they do of the pyramids, and obelisks, and mighty temples of the Upper Nile. The truth is, it is sixty miles in length, ninety feet in breadth, and eighteen in depth, through a perfectly level country, not requiring a single lock. In regard to the time in which it was made, it certainly is an extraordinary work; and it could only have been done in that time, in such a country as Egypt, where the government is an absolute despotism, and the will of one man is the supreme law. Every village was ordered to furnish a certain quota; 150,000 workmen were employed at once, and in a year from its commencement the whole excavation was made. As a great step in the march of public improvement, it certainly does honour to the pacha, though, in passing along its banks, our admiration of a barbarian struggling into civilisation is checked by remembering his wanton disregard of human life, and the melancholy fact that it proved the grave of more than 30,000 of his subjects.

We started in company with a Mr Waghorn, formerly in the East India Company's service, now engaged in forwarding the mails from England to India by the Red Sea. He was one of the first projectors of that route, is a man of indefatigable activity and energy, and was the first courier sent from England with dispatches over land. He travelled post to Trieste, took a Spanish vessel to Alexandria, and thence by dromedary to Cairo and Suez, where, not finding the

vessel which had been ordered to meet him, and having with him a compass, his constant travelling companion, he hired an open Arab boat, and, to the astonishment of his Arab crew, struck out into the middle of the Red Sea. At night they wanted, as usual, to anchor near the shore; but he sat with the helm in one hand and a cocked pistol in the other, threatening to shoot the first man that disobeyed his orders. On entering the harbour of Mocha, he found an English government vessel on its way to meet him, and in the then uncommonly short time of fifty-five days, delivered his dispatches in Bombay.

At about eight o'clock next morning we were standing on the banks of the Nile, the eternal river, the river of Egypt, recalling the days of Pharaoh and Moses—from the earliest periods of recorded time watering and fertilising a narrow strip of land in the middle of a sandy desert, rolling its solitary way more than a thousand miles without receiving a single tributary stream; the river which the Egyptians worshipped and the Arabs loved, and which, as the Mussulmans say, if Mohammed had tasted, "he would have prayed Heaven for terrestrial immortality, that he might continue to enjoy it for ever."

I cannot, however, join in the enthusiasm of the Mussulmans, for I have before me at this moment a vivid picture of myself and servant at Cairo, perched upon opposite divans covered with tawdry finery, in a huge barn of a room, with a ceiling thirty feet high, like two knights of the rueful countenance, comparing notes and bodily symptoms, and condoling with each other upon the corporeal miseries brought upon us by partaking too freely of the water of the Nile.

The appearance of the river at the mouth of the canal is worthy of its historic fame. I found it more than a mile wide, the current at that season full and strong; the banks on each side clothed with a beautiful verdure and groves of palm-trees (the most striking feature in African scenery), and the village of Fouah, the stopping-place for boats coming up from Rosetta and Damietta, with its mosques, and minarets, and whitened domes, and groves of palms, forming a picturesque object in the view.

Upon entering the Nile, we changed our boat, the new one being one of the largest and best on the river, of the class called *cantiah*, about seventy feet long, with two enormous latteen sails; these are triangular in form, and attached to two very tall spars more than a hundred feet long, heavy at the end, and tapering to a point; the spars or yards rest upon two short masts, playing upon them as on pivots. The spar rests at an angle of about thirty degrees, and, carrying the sail to its tapering point, gives the boat when under way a peculiarly light and graceful appearance. In the stern, a small place is housed over, which makes a very tolerable cabin, except that the ceiling is too low to admit of standing upright, being made to suit the cross-legged habits of the eastern people. She was manned by ten Arabs, good stout fellows, and a *rais* or captain.

## CHAPTER II.

From Alexandria to Cairo.—Experience versus Travellers' Tales.—An unintended Bath.—Iron Rule of the Pacha.—Entrance into Cairo.—A Chat with a Pacha.

We commenced our voyage with that north wind which, books and travellers tell us, for nine months in the year continues to blow the same way, making it an easy matter to ascend from the Mediterranean to the Cataracts, even against the strong current of the river; and I soon busied myself with meditating upon this extraordinary operation of nature, thus presenting itself to my observation at the very moment of my entrance into this wonderful country. It was a beautiful ordinance of Providence in regard to the feebleness and wants of man, that while the noble river

rolled on eternally in one unbroken current, another agent of Almighty power should almost as constantly fill the flowing canvass, and enable navigators to stem the downward flow. I was particularly pleased with this train of reflection, inasmuch as at the moment we had the best of it. We were ascending against the current at the rate of six or seven miles an hour, with a noise and dash through the water that made it seem like nine or ten, while the descending boats, with their spars taken out and sails tied close, were crawling down almost imperceptibly, stern first, broadside first, not as the current carried them, but as the wind would let them. Our men had nothing to do; all day they lay strewn about on deck; towards evening they gathered around a large pilau of rice; and as the sun was setting, one after the other, turning his face towards the tomb of the Prophet, kneeled down upon the deck and prayed. And thus passed my first night upon the Nile.

In the morning I found things not quite so well ordered; the wind seemed to be giving "premonitory symptoms" of an intention to chop about, and towards noon, it came dead ahead. After my self-complacent observations of yesterday, I would hardly credit it; but when it became so strong that we were obliged to haul alongside the bank and lie-to, in order to avoid being driven down the stream, I was perfectly satisfied and convinced. We saw no more of our friend Mr Waghorn; he had a small boat rigged with oars, and while we were vainly struggling against wind and tide, he kindly left us to our fate. My companion was a sportsman, and happened to have on board a couple of guns; we went on shore with them, and the principal incident of the day that I remember is, that instead of fowler's, I had fisherman's luck. Rambling carelessly along, we found ourselves on the bank of a stream which it was necessary to cross; on the other side we saw a strapping Arab, and called to him to come and carry us over. Like most of his tribe, he was not troubled with any superfluous clothing, and slipping over his head the fragments of his frock, he was in a moment by our side, in all the majesty of nature. I started first, mounted upon his slippery shoulders, and went along very well until we had got more than half way over, when I began to observe an irregular tottering movement, and heard behind me the smothered laugh of my companion. I felt my Arab slowly and deliberately lowering his head; my feet touched the water; but with one hand I held my gun above my head, and with the other gripped him by the throat. I found myself going, going deeper and deeper, let down with the most studied deliberation, till all at once he gave his neck a sudden toss, jerked his head from under me, and left me standing up to my middle in the stream. I turned round upon him, hardly knowing whether to laugh or to strike him with the butt end of my gun; but one glance at the poor fellow was enough; the sweat stood in large drops on his face and ran down his naked breast; his knees shook, and he was just ready to drop himself. He had supported me as long as he could; but finding himself failing, and fearing we should both come down together with a splash, at full length, he had lowered me as gently as possible.

The banks of the Nile from here to Cairo furnish nothing interesting. On one side is the Delta, an extensive tract of low rich land, well cultivated and watered, and on the other a narrow strip of fertile land, and then the Libyan Desert. The ruined cities which attract the traveller into Egypt, their temples and tombs, the enduring monuments of its former greatness, do not yet present themselves. The modern villages are all built of mud or of unburnt bricks, and sometimes, at a distance, being surrounded by palm-trees, making a pleasing appearance; but this vanishes the moment you approach them. The houses, or rather huts, are so low that a man can seldom stand up in them, with a hole in front like the door of an oven, into which the miserable Arab crawls, more like a beast than a being made to walk in God's image. The same

spectacle of misery and wretchedness, of poverty, famine, and nakedness, which I had seen in the suburbs of Alexandria, continued to meet me at every village on the Nile, and soon suggested the interesting consideration whether all this came from country and climate, from the character of the people, or from the government of the great reformer. At one place, I saw on the banks of the river forty or fifty men chained together with iron bands around their wrists, and iron collars around their necks. Yesterday they were peaceful Fellahs, cultivators of the soil, earning their scanty bread by hard and toilsome labour, but eating it at home in peace. Another day, and the stillness of their life is for ever broken; chased, run down, and caught, torn from their homes, from the sacred threshold of the mosque, the sword and musket succeed the implements of their quiet profession; they are carried away to fight battles in a cause which does not concern them, and in which, if they conquer, they can never gain.

Returning to our boat on the brink of the river, a slight noise caught my ear; I turned, and saw a ragged mother kissing her naked child, while another of two years old, dirty and disgusting, was struggling to share its mother's embraces; their father I had just seen with an iron collar round his neck; and she loved these miserable children, and they loved their miserable mother, as if they were all clothed "in purple and fine raiment every day." But a few minutes after, a woman, knowing that we were "Franks," brought on board our boat a child, with a face and head so bloated with disease that it was disgusting to look at. The rais took the child in his arms and brought it up to us, the whole crew following with a friendly interest. My companion gave them a bottle of brandy, with which the rais carefully bathed the face and head of the child, all the crew leaning over to help; and when they had finished to their satisfaction, these kind-hearted but clumsy nurses kissed the miserable bawling infant, and passed it, with as much care as if it had been a basket of crockery, into the hands of the grateful mother.

This scene was finely contrasted with one that immediately followed. The boat was aground, and in an instant, stripping their long gowns over their heads, a dozen large swarthy figures were standing naked on the deck; in a moment more they were splashing in the river, and with their brawny shoulders under the bottom of the vessel, heaved her off the sand-bank. Near this we passed a long line of excavation, where several hundred men were then digging, being part of the gigantic work of irrigating the Delta lately undertaken by the pacha.

Towards the evening of the fourth day we came in sight of the "world's great wonder," the eternal pyramids, standing at the head of a long reach in the river directly in front of us, and almost darkening the horizon; solitary, grand, and gloomy, the only objects to be seen in the great desert before us. The sun was about setting in that cloudless sky known only in Egypt; for a few moments their lofty summits were lighted by a gleam of lurid red, and as the glorious orb settled behind the mountains of the Libyan Desert, the atmosphere became dark and more indistinct, and their clear outline continued to be seen after the whole earth was shrouded in gloom.

The next morning at seven o'clock we were alongside the Island of Rhoda, as the Arab boatmen called it, where the daughter of Pharaoh came down to bathe, and found the little Moses. We crossed over in a small boat to Boulac, the harbour of Cairo, breakfasted with Mr T—, the brother-in-law of my friend, an engineer in the pacha's service, whose interesting wife is the only English lady there; and mounting a donkey, in half an hour I was within the walls of Grand Cairo. The traveller who goes there with the reminiscences of Arabian tales hanging about him, will nowhere see the Cairo of the califs; but before arriving there he will have seen a curious and striking spectacle. He will have seen, streaming from the gate among loaded camels and dromedaries, the dashing Turk, with his

glittering sabre, the wily Greek, the grave Armenian, and the despised Jew, with their long silk robes, their turbans, solemn beards, and various and striking costumes; he will have seen the harem of more than one rich Turk, eight or ten women on horseback, completely enveloped in large black silk wrappers, perfectly hiding face and person, and preceded by that abomination of the East, a black eunuch; the miserable sauton, the Arab saint, with a few scanty rags on his breast and shoulders, the rest of his body perfectly naked; the swarthy Bedouin of the desert, the haughty janizary, with a cocked gun in his hand, dashing furiously through the crowd, and perhaps bearing some bloody mandate of his royal master; and perhaps he will have seen and blushed for his own image in the person of some beggarly Italian refugee. Entering the gate, guarded by Arab soldiers in a bastard European uniform, he will cross a large square filled with officers and soldiers, surrounded by what are called palaces, but seeing nothing that can interest him save the house in which the gallant Kleber, the hero of many a bloody field, died ingloriously by the hands of an assassin. Crossing this square, he will plunge into the narrow streets of Cairo. Winding his doubtful and perilous way among tottering and ruined houses, jostled by camels, dromedaries, horses, and donkeys, perhaps he will draw up against a wall, and, thinking of plague, hold his breath, and screw himself into nothing, while he allows a corpse to pass, followed by a long train of howling women, dressed in black, with masks over their faces; and entering the large wooden gate which shuts in the Frank quarter for protection against any sudden burst of popular fury, and seating himself in a miserable Italian locanda, he will ask himself, Where is the "Cairo of the califs, the superb town, the holy city, the delight of the imagination, greatest among the great, whose splendour and opulence made the prophet smile?"

Almost immediately upon my arrival, I called upon Mr Gliddon, our vice-consul, and upon Nubar Bey, an Armenian dragoman to the pacha, to whom I had a letter from a gentleman in Alexandria. The purport of my visit to the latter was to procure a presentation to the pacha. He told me that several English officers from India had been waiting several days for that purpose; that he thought the pacha would receive them the next day, and, if so, he would ask permission to present me. Having arranged this, and not being particularly pleased with the interior, and liking exceedingly the donkeys, on which it is the custom there to mount on all occasions, for long and for short distances, I selected one that was particularly gay and sprightly, and followed by an Arab boy who had picked up a few Italian words, I told him to take me any where outside the city. He happened to take me out at the same gate by which I had entered, and I rode to Old Cairo.

Old Cairo is situated on the river, about four miles from Boulac. The road is pretty, and some of the points of view, particularly in returning, decidedly beautiful. The aqueduct which conveys water into the citadel at Cairo is a fine substantial piece of workmanship, and an item in the picture. The church and grotto in which, as tradition says, the Virgin Mary took refuge with the infant Saviour, when obliged to fly from the tetrarch of Judea, are among the few objects worthy of note in Old Cairo. The grotto, which is guarded with pious care by the Coptic priest, is a small excavation, the natural surface covered with smooth tiles; it is hardly large enough to allow one person to crawl in and sit upright. It is very doubtful whether this place was ever the refuge of the Virgin, but the craft or simplicity of the priests sustains the tradition; and a half dozen Coptic women, with their faces covered, and their long blue dresses, followed me down into the vault, and knecled before the door of the grotto, with a devotion which showed that they at least believed the tale.

At my locanda this morning I made acquaintance with two English parties, a gentleman, his lady, and nephew, who had been travelling in their own yacht

on the Mediterranean, and the party of English officers to whom I before referred, as returning from India by way of the Red Sea. They told me that they were expecting permission from the pacha to wait on him that day, and asked me to accompany them. This suited me better than to go alone, as I was not ambitious for a tête-à-tête with his highness, and merely wished to see him as one of the lions of the country. Soon after I received a note from the consul, telling me that his highness would receive me at half-past three. This, too, was the hour appointed for the reception of the others, and I saw that his highness was disposed to make a lumping business of it, and get rid of us all at once. I accordingly suggested to Mr Gliddon that we should all go together; but this did not suit him; he was determined that I should have the benefit of a special audience. I submitted myself to his directions, and in this, as in other things, while at Cairo, found the benefit of his attentions and advice.

It is the custom of the pacha upon such occasions to send horses from his own stable, and servants from his own household, to wait upon the stranger. At half past three I left my hotel, mounted on a noble horse, finely caparisoned, with a dashing red cloth saddle, a bridle ornamented with shells, and all the decorations and equipments of a well-mounted Turkish horseman, and, preceded by the janizary and escorted by the consul, with no small degree of pomp and circumstance I arrived at the gate of the citadel. Passing through a large yard, in which are several buildings connected with the different offices of government, we stopped at the door of the palace, and, dismounting, ascended a broad flight of marble steps to a large or central hall, from which doors opened into the different apartments. There were three recesses fitted up with divans, where officers were lounging, smoking, and taking coffee. The door of the divan, or hall of audience, was open, at which a guard was stationed; and in going up to demand permission to enter, we saw the pacha at the farther end of the room, with four or five Turks standing before him.

Not being allowed to enter yet, we walked up and down the great hall, among lounging soldiers and officers of all ranks and grades, Turks, Arabs, and beggars, and went out upon the balcony. The view from this embraces the most interesting objects in the vicinity of Cairo, and there are few prospects in the world which include so many; the land of Goshen, the Nile, the obelisk at Heliopolis, the tombs of the califs, the pyramids, and the deserts of eternal sands.

While standing upon the balcony, a janizary came to tell us that the pacha would receive us, or, in other words, that we must come to the pacha. The audience chamber was a very large room, with a high ceiling—perhaps eighty feet long and thirty high—with arabesque paintings on the wall, and a divan all around. The pacha was sitting near one corner at the extreme end, and had a long and full view of every one who approached him. I, too, had the same advantage, and in walking up I remarked him as a man about sixty-five, with a long and very white beard, strong features, of a somewhat vulgar cast, a short nose, red face, and rough skin, with an uncommonly fine dark eye, expressing a world of determination and energy. He wore a large turban and a long silk robe, and was smoking a long pipe with an amber mouthpiece. Altogether, he looked the Turk much better than his nominal master the sultan.

His dragoman, Nubar Bey, was there, and presented me. The pacha took his pipe from his mouth, motioned me to take a seat at his right hand on the divan, and with a courteous manner said I was welcome to Egypt. I told him he would soon have to welcome half the world there; he asked me why; and, without meaning to flatter the old Turk, I answered that every body had a great curiosity to visit that interesting country; that heretofore it had been very difficult to get there, and dangerous to travel in when there;

but now the facilities of access were greatly increased, and travelling in Egypt had become so safe under his government, that strangers would soon come with as much confidence as they feel while travelling in Europe; and I had no doubt there would be many Americans among them. He took his pipe from his mouth, and bowed. I sipped my coffee with great complacency, perfectly satisfied with the manner in which, for the first time, I had played the courtier to royalty. Knowing his passion for new things, I went on, and told him that he ought to continue his good works, and introduce on the Nile a steam-boat from Alexandria to Cairo. He took the pipe from his mouth again, and in the tone of "Let there be light, and there was light," said he had ordered a couple. I knew he was fibbing, and I afterwards heard from those through whom he transacted all his business in Europe, that he had never given any such order. Considering that a steam-boat was an appropriate weapon in the hands of an American, I followed up my blow by telling him that I had just seen mentioned, in a European paper, a project to run steam-boats from New York to Liverpool in twelve or fourteen days. He asked me the distance; I told him, and he said nothing and smoked on. He knew America, and particularly from a circumstance which I afterwards found had done wonders in giving her a name and character in the East, the visit of Commodore Patterson in the ship Delaware. So far I had taken decidedly the lead in the conversation; but the constant repetition of "son attesse" by the dragoman, began to remind me that I was in the presence of royalty, and that it was my duty to speak only when I was spoken to. I waited to give him a chance, and the first question he asked was as to the rate of speed of the steam-boats on our rivers. Remembering an old, crazy, five or six mile an hour boat that I had seen in Alexandria, I was afraid to tell him the whole truth, lest he should not believe me, and did not venture to go higher than fifteen miles an hour; and even then he looked as Ilderim may be supposed to have looked when the Knight of the Leopard told him of having crossed over a lake like the Dead Sea without wetting his horse's hoofs. I have no doubt, if he ever thought of me afterwards, that it was as the lying American; and just at this moment, the party of English coming in, I rose and took my leave. Gibbon says, "When Persia was governed by the descendants of Sefs, a race of princes whose wanton cruelty often stained their divan, their table, and their bed, with the blood of their favourites, there is a saying recorded of a young nobleman that he never departed from the sultan's presence without satisfying himself whether his head was still on his shoulders." It was in somewhat of the same spirit that, in passing, one of the Englishmen whispered to me, "Are you sure of your legs?"

During my interview with the pacha, although my conversation and attention were directed towards him, I could not help remarking particularly his dragoman, Nubar Bey. He was an Armenian, perhaps a year or two over thirty, with an olive complexion, and a countenance like marble. He stood up before us, about half way between the pacha and me, his calm eye finely contrasted with the roving and unsettled glances of the pacha, a perfect picture of indifference, standing like a mere machine to translate words, without seeming to comprehend or take the least interest in their import; and though I had been particularly recommended to him, he did not give me a single glance to intimate that he had ever seen me before, or cared ever to see me again. He was an ambitious man, and was evidently acting, and acted well, a part suited to an eastern court; the part necessary in his responsible and dangerous position, as the depositary of important secrets of government. He was in high favour with the pacha, and, when I left, was in a fair way of attaining any honour at which his ambitious spirit might aim. On my return to Alexandria, four months after, he was dead.

The life and character of Mohammed Ali are a study and a problem. Like Bernadotte of Sweden, he has

risen from the rank of a common soldier, and now sits firmly and securely on a throne of his own making. He has risen by the usual road to greatness among the Turks; war, bloodshed, and treachery. In early life his bold and daring spirit attracted the attention of beys, pachas, and the sultan himself; and having attained a prominent position in the bloody wars that distracted Egypt under the Mamelukes, boldness, cruelty, intrigue, and treachery, placed him on the throne of the califs; and neither then nor since have these usual engines of Turkish government, these usual accompaniments of Turkish greatness, for a moment deserted him. The extermination of the Mamelukes, the former lords of Egypt, as regards the number killed, is perhaps nothing in comparison with the thousands whose blood cries out from the earth against him; but the manner in which it was effected brands the pacha as the prince of traitors and murderers. Invited to the citadel on a friendly visit, while they were smoking the pipe of peace he was preparing to murder them; and no sooner had they left his presence than they were pent up, fired upon, cut down and killed, bravely but hopelessly defending themselves to the last. This cruel deed must not be likened to the slaughter of the janizaries by the sultan, to which it is often compared, for the janizaries were a powerful body, insulting and defying the throne. The sultan staked his head upon the issue, and it was not till he had been driven to the desperate expedient of unfurling the sacred standard of the prophet, and calling upon all good Mussulmans to rally round it—in a word, it was not till the dead bodies of 30,000 janizaries were floating down the Bosphorus, that he became master in his own dominions. Not so with the pacha; the Mamelukes were reduced to a feeble band of 400 or 500 men, and could effect nothing of importance against the pacha. His cruelty and treachery can neither be forgotten nor forgiven; and when, in passing out of the citadel, the stranger is shown the place where the unhappy Mamelukes were penned up and slaughtered like beasts, one only leaping his gallant horse over the walls of the citadel, he feels that he has left the presence of a wholesale murderer. Since that time he has had Egypt quietly to himself; has attacked and destroyed the Wahabees on the Red Sea, and subdued the countries above the Cataracts of the Nile, to Senaar and Dongola. He has been constantly aiming at introducing European improvements; has raised and disciplined an army according to European tactics; increased the revenues, particularly by introducing the culture of cotton, and has made Egypt, from the Mediterranean to the Cataracts, as safe for the traveller as the streets of New York. It remains to be seen, whether, after all, he has not done more harm than good, and whether the miserable and oppressed condition of his subjects does not more than counterbalance all the good that he has done for Egypt. One of the strongest evidences he gave of his civilising inclinations is the tendency he once manifested to fall under petticoat government. He was passionately fond of his first wife, the sharer of his poverty and meridian greatness, and the mother of his two favourite children, Yousouff and Ibrahim Pacha; and whenever a request was preferred in her name, the enamoured despot would swear his favourite oath, "By my two eyes, if she wishes it, it shall be done." Fond of war, and having an eye to the islands of Candia and Cyprus, he sent a large fleet and army, commanded by his son Ibrahim Pacha, to aid the sultan in his war against Greece, and with his wild Egyptians turned the tide against that unhappy country, receiving as his reward the islands which he coveted. More recently, availing himself of a trifling dispute with the governor of Acre, he turned his arms against the sultan, invaded Syria, and after a long siege, took and made himself master of Acre; his victorious armies under his son Ibrahim swept all Syria; Jerusalem, Damascus, and Aleppo, fell into his hands; and beating the sultan's forces whenever he met them, in mid winter he led his Egyptians over Mount Taurus, defeated the grand vizier with more than 100,000 men,

almost under the walls of Constantinople, and would have driven the sultan from the throne of his ancestors, if the Russians, the old enemies of the Porte, had not come in to his relief. According to the policy of the Porte, that which is wrested from her and she cannot get back, she confirms in the possession of the rebel; and Palestine and Syria are now in the hands of Mohammed Ali, as the fruits of drawing his sword against his master. He still continues to pay tribute to the sultan, constrained doubtless to make the last payment by the crippled state in which he was left by the terrible plague of 1834; and without any enemy to fear, is at this moment draining the resources of his country to sustain a large army and navy. No one can fathom his intentions; and probably he does not know them himself, but will be governed, as the Turks always are, by caprice and circumstances.

On leaving the pacha, Mr Gliddon proposed that we should call upon the governor of Cairo. We stopped at what would be called in France the "Palais de Justice," and, mounting a dozen steps, entered a large hall, at one end of which stood the governor. He was a short stout man, of about fifty-five, with a long beard, handsomely dressed, and stood gently rubbing his hands, and constantly working his jaws, like an ox chewing the cud. A crowd was gathered around him, and just as we were approaching, the crowd fell back, and we saw an Arab lying on his face on the floor, with two men standing over him, one on each side, with whips like cow-skins, carrying into effect the judgment of the munching governor. The blows fell thickly and heavily, the poor fellow screamed piteously, and when the full number had been given he could not move; he was picked up by his friends, and carried out of doors. It was precisely such a scene as realised the reference in the Scriptures to the manners of the East in the time of our Saviour, when a complaint was made to the judge, and the judge handed the offender over to justice; or the graphic accounts in the Arabian Nights, of summary justice administered by the *cadi* or other expounder of the law, without the intervention of lawyers or jury. The poor Arab was hardly removed before another complaint was entered; but not feeling particularly amiable towards the governor, and having seen enough of the great Turks for that day, I left the citadel and rode to my hotel.

### CHAPTER III.

The Slave-market at Cairo.—Tomb of the Pacha.—The Pyramid of Cheops.—Oppressive Attention of the Arabs.—The Sphinx.

NEARLY all the time I was at Cairo, Paul and myself were ill, and for a few days we were in a rather pitiable condition. Fortunately, a young English army surgeon was there, on his way to India, and hearing there was a sick traveller in the house, he with great kindness called upon me and prescribed for our ailments. If this book should ever meet the eye of Dr Forbes, he will excuse my putting his name in print, as it is the only means I have of acknowledging his kindness in saving me from what would otherwise have been a severe and most inconvenient illness. At that time there was no English physician in Cairo, and I believe none at all, except some vile, half-bred Italian or French apothecaries, who held themselves fully qualified to practise, and were certainly very successful in relieving the sick from all their sufferings. On my return I found Dr Walne; and though for his own sake I could wish him a better lot, I hope for the benefit of sick travellers that he is there still.

One of my first rambles in Cairo was to the slave-market. It is situated nearly in the centre of the city, as it appeared to me, although after turning half a dozen corners in the narrow streets of a Turkish city, I will defy a man to tell where he is exactly. It is a large old building, enclosing a hollow square, with chambers all around, both above and below. There were probably 500 or 600 slaves, sitting on mats in groups of ten, twenty, or thirty, each belonging to a

different proprietor. Most of them were entirely naked, though some, whose shivering forms evinced that even there they felt the want of their native burning sun, were covered with blankets. They were mostly from Dongola and Sennaar; but some were Abyssinians, with yellow complexions, fine eyes and teeth, and decidedly handsome. The Nubians were very dark, but with oval, regularly formed and handsome faces, mild and amiable expressions, and no mark of the African except the colour of their skin. The worst spectacle in the bazaar was that of several lots of sick, who were separated from the rest, and arranged on mats by themselves; their bodies thin and shrunken, their chins resting upon their knees, their long lank arms hanging helplessly by their sides, their faces haggard, their eyes fixed with a painful vacancy, and altogether presenting the image of man in his most abject condition. Meeting them on their native sands, their crouching attitudes, shrunken jaws, and rolling eyes, might have led one to mistake them for those hideous animals the orang-outang and ape. Prices vary from twenty to a hundred dollars; but the sick, as carrying within them the seeds of probable death, are coolly offered for almost nothing, as so much damaged merchandise which the seller is anxious to dispose of before it becomes utterly worthless on his hands. There was one, an Abyssinian, who had mind as well as beauty in her face; she was dressed in silk, and wore ornaments of gold and shells, and called me as I passed, and peeped from behind a curtain, smiling and coquetting, and wept and pouted when I went away; and she thrust out her tongue to show me that she was not like those I had just been looking at, but that her young blood ran pure and healthy in her veins.

Cairo is surrounded by a wall; the sands of the desert approach it on every side, and every gate, except that of Boulac, opens to a sandy waste. Passing out by the Victory Gate, the contrast between light and darkness is not greater than between the crowded streets and the stillness of the desert, separated from them only by a wall. Immediately without commences the great burial-place of the city. Among thousands and tens of thousands of Mussulmans' headstones, I searched in vain for the tomb of the lamented Burckhardt; there is no mark to distinguish the grave of the enterprising traveller from that of an Arabian camel-driver. At a short distance from the gate are the tombs of the califs, large and beautiful buildings, monuments of the taste and skill of the Saracens.

From hence, passing around outside the walls, I entered by the gate of the Citadel, where I saw what goes by the name of Joseph's Well, perhaps better known as the Well of Saladin. It is 45 feet wide at the mouth, and cut 270 feet deep through the solid rock, to a spring of saltish water, on a level with the Nile, whence the water is raised in buckets on a wheel, turned by a buffalo.

On the 25th, with a voice that belied my feelings, I wished Paul a merry Christmas; and after breakfast, wishing to celebrate the day, mounted a donkey and rode to the site of the ancient Heliopolis, near the village of Matarea, about four miles from Cairo, on the borders of the rich land of Goshen. The geographer Strabo visited these ruins thirty years A.C., and describes them almost exactly as we see them now. A great temple of the sun once stood here. Herodotus and Plato studied philosophy in the schools of Heliopolis; "a barbarous Persian overturned her temples; a fanatic Arabian burnt her books;" and a single obelisk, sixty-seven feet high, in a field ploughed and cultivated to its very base, stands a melancholy monument of former greatness and eternal ruin.

Passing out by another gate is another vast cemetery, ranges of tombs extending miles out into the desert. In Turkey I had admired the beauty of the graveyards, and often thought how calmly slept the dead under the thick shade of the mourning cypress. In Egypt I admired still more the solemn stillness and grandeur of a last resting-place among the eternal sands of the desert. In this great city of the dead stand the

tombs of the Mamelukes, originally slaves from the foot of the Caucasus, then the lords and tyrants of Egypt, and now an exterminated race: the tombs are large handsome buildings, with domes and minarets, the interior of the domes beautifully wrought, and windows of stained glass, all going to ruins. Here, too, is the tomb of the pacha. Fallen, changed, completely revolutionised as Egypt is, even to this day peculiar regard is paid to the structure of tombs and the burial-places of the dead. The tomb of the pacha is called the greatest structure of modern Egypt. It is a large stone building, with several domes, strongly but coarsely made. The interior, still, solemn, and imposing, is divided into two chambers; in the first, in a conspicuous situation, is the body of his favourite wife, and around are those of other members of his family; in the other chamber are several tombs covered with large and valuable Cashmere shawls; several places yet unoccupied, and in one corner a large vacant place, reserved for the pacha himself. Both apartments are carpeted, and illuminated with lamps, with divans in the recesses, and little wicker chairs for the different members of the family who come to mourn and pray. Two ladies were there, sitting near one of the tombs, their faces completely covered; and, that I might not disturb their pious devotions, my guide led me in a different direction.

During the time that I had passed in lounging about Cairo, I had repeatedly been down to Boulac in search of a boat for my intended voyage up the Nile; and going one Sunday to dine on the Island of Rhoda with Mr Trail, a young Englishman who had charge of the palace and garden of Ibrahim Pacha, I again rode along the bank of the river for the same purpose. In coming up from Alexandria, I had found the inconveniences of a large boat, and was looking for one of the smallest dimensions that could be at all comfortable. We were crossing over one more than half sunk in the water, which I remarked to Paul was about the right size; and while we stopped a moment, without the least idea that it could be made fit for use, an Arab came up and whispered to Paul that he could pump out the water in two hours, and had only sunk the boat to save it from the officers of the pacha, who would otherwise take it for the use of government. Upon this information I struck a bargain for the boat, eight men, a rais, and a pilot. The officers of the pacha were on the bank looking out for boats, and notwithstanding my Arab's ingenious contrivance, just when I had closed my agreement, they came on board and claimed possession. I refused to give up my right, and sent to the agent of the consul for an American flag. He could not give me an American, but sent me an English flag, and I did not hesitate to put myself under its protection. I hoisted it with my own hands; but the rascally Turks paid no regard to its broad folds. The majesty of England did not suffer, however, in my hands, and Paul and I spent more than an hour in running from one officer to another, before we could procure the necessary order for the release of the boat. Leaving this with the rais, and the flag still flying, I went on to Rhoda, and spent the day there in decidedly the prettiest spot about Cairo. At the head of this island is the celebrated Nilometer, which, for no one knows how long, has marked the annual rise and fall of the Nile.

I had been ten days in Cairo without going to the pyramids. I had seen them almost every day, but my doctor, who was to accompany me, had delayed my visit. He was obliged to leave Cairo, however, before I was ready to go; and as soon as he was off, like a schoolboy when the master is out of sight, I took advantage of his absence. My old friend from Alexandria had promised to go with me, and joining me at Old Cairo, we crossed over to Ghizeh. Almost from the gates of Cairo the pyramids are constantly in sight, and, after crossing the ferry, we at first rode directly towards them; but the waters were yet so high that we were obliged to diverge from the straight road. In about an hour we separated, my guide taking one route

and my friends another. With my eyes constantly fixed on the pyramids, I was not aware of our separation until I had gone too far to return, and my guide proved to be right. Standing alone on an elevated mountainous range on the edge of the desert, without any object with which to compare them, the immense size of the pyramids did not strike me with full force. Arrived at the banks of a stream, twenty Arabs, more than half naked, and most of them blind of an eye, came running towards me, dashed through the stream, and pulling, hauling, and scuffling at each other, all laid hold of me to carry me over. All seemed bent upon having something to do with me, even if they carried me over piecemeal; but I selected two of the strongest, with little more than one eye between them, and keeping the rest off as well as I could, was borne over dryshod. Approaching, the three great pyramids and one small one are in view, towering higher and higher above the plain. I thought I was just upon them, and that I could almost touch them; yet I was more than a mile distant. The nearer I approached, the more their gigantic dimensions grew upon me, until, when I actually reached them, rode up to the first layer of stones, and saw how very small I was, and looked up their sloping sides to the lofty summits, they seemed to have grown to the size of mountains.

The base of the great pyramid is about 300 feet square, covering a surface of about eleven acres, according to the best measurement, and four hundred and sixty-one feet high; or, to give a clearer idea, starting from a base as large as Washington Parade Ground, it rises to a tapering point nearly three times as high as Trinity church steeple. Even as I walked around it and looked up at it from the base, I did not feel its immensity until I commenced ascending; then, having climbed some distance up, when I stopped to breathe and look down upon my friend below, who was dwindled into insect size, and up at the great distance between me and the summit, then I realised in all their force the huge dimensions of this giant work. It took me twenty minutes to mount to the summit; about the same time that it had required to mount the cones of *Ætna* and *Vesuvius*. The ascent is not particularly difficult, at least with the assistance of the Arabs. There are 206 tiers of stone, from one to four feet in height, each two or three feet smaller than the one below, making what are called the steps. Very often the steps were so high that I could not reach them with my feet. Indeed, for the most part, I was obliged to climb with my knees, deriving great assistance from the step which one Arab made for me with his knee, and the helping hand of another above.

It is not what it once was to go to the pyramids. They have become regular lions for the multitudes of travellers; but still, common as the journey has become, no man can stand on the top of the great pyramid of Cheops, and look out upon the dark mountains of Mokattam bordering the Arabian desert; upon the ancient city of the Pharaohs, its domes, its mosques and minarets, glittering in the light of a vertical sun; upon the rich valley of the Nile, and the "river of Egypt" rolling at his feet; the long range of pyramids and tombs extending along the edge of the desert to the ruined city of Memphis, and the boundless and eternal sands of Africa, without considering that moment an epoch not to be forgotten. Thousands of years roll through his mind, and thought recalls the men who built them, their mysterious uses, the poets, historians, philosophers, and warriors, who have gazed upon them with wonder like his own.

For one who but yesterday was bustling in the streets of a busy city, it was a thing of strange and indescribable interest to be standing on the top of the great pyramid, surrounded by a dozen half-naked Arabs, forgetting, as completely as if they had never been, the stirring scenes of his distant home. But even here petty vexations followed me, and half the interest of the time and scene was destroyed by the clamour of my guides. The descent I found extremely easy; many

persons complain of the dizziness caused by looking down from such a height, but I did not find myself so affected; and though the denkeys at the base looked like flies, I could almost have danced down the mighty sides.\*

The great pyramid is supposed to contain 6,000,000 of cubic feet of stone, and 100,000 men are said to have been employed twenty years in building it. The four angles stand exactly in the four points of the compass, inducing the belief that it was intended for other purposes than those of a sepulchre. The entrance is on the north side. The sands of the desert have encroached upon it, and, with the fallen stones and rubbish, have buried it to the sixteenth step. Climbing over this rubbish, the entrance is reached, a narrow passage three and a half feet square, lined with broad blocks of polished granite, descending in the interior at an angle of twenty-seven degrees for about ninety-two feet; then the passage turns to the right, and winds upward to a steep ascent of eight or nine feet, and then falls into the natural passage, which is five feet high and one hundred feet long, forming a continued ascent to a sort of landing-place; in a small recess of this is the orifice or shaft called the well. Moving onward through a long passage, the explorer comes to what is called the Queen's Chambers, seventeen feet long, fourteen wide, and twelve high. I entered a hole opening from this crypt, and crawling on my hands and knees, came to a larger opening, not a regular chamber, and now cumbered with fallen stones. Immediately above this, ascending by an inclined plane lined with highly polished granite, and about 120 feet in length, and mounting a short space by means of holes cut in the sides, I entered the King's Chamber, about thirty-seven feet long, seventeen feet wide, and twenty feet high. The walls of the chamber are of red granite, highly polished, each stone reaching from the floor to the ceiling; and the ceiling is formed of nine large slabs of polished granite, extending from wall to wall. It is not the least interesting part of a visit to the interior of the pyramids, as you are groping your way after your Arab guide, to feel your hand running along the sides of an enormous shaft, smooth and polished as the finest marble, and to see by the light of the flaring torch chambers of red granite from the Cataracts of the Nile, the immense blocks standing around and above you, smooth and beautifully polished in places, where, if our notions of the pyramids be true, they were intended but for few mortal eyes. At one end of the chamber stands a sarcophagus, also of red granite; its length is seven feet six inches, depth three and a half, breadth three feet three inches. Here is supposed to have slept one of the great rulers of the earth, the king of the then greatest kingdom of the world, the proud mortal for whom this mighty structure was raised. Where is he now? Even his dry bones are gone, torn away by rude hands, and scattered by the winds of heaven.

There is something curious about this sarcophagus too. It is exactly the size of the orifice which forms the entrance of the pyramid, and could not have been conveyed to its place by any of the now known passages; consequently, must have been deposited during the building, or before the passage was finished in its pre-

\* A few years ago an unfortunate accident happened at this pyramid. An English officer, Mr M., who had come up the Red Sea from India with his friend, had mounted to the top, and, while his friend was looking another way, Mr M. was walking around the upper layer of stones, and fell; he rolled down eight or ten steps, and caught; for a moment he turned up his face with an expression that his friend spoke of as horrible beyond all description, when his head sank, his grasp relaxed, and he pitched headlong, rolling over and over to the bottom of the pyramid. Every bone in his body was broken; his mangled corpse was sewed up in a sack, carried to Old Cairo, and buried, and his friend returned the same day to Cairo. There were at the time imputations that Mr M. had premeditated this act, as he had left behind him his watch, money, and papers, and had been heard to say what a glorious death it would be to die by jumping from the top of a pyramid.

sent state. The interior of the pyramid is excessively hot, particularly when surrounded by a number of Arabs and flaring torches. Leaving the King's Chamber, I descended the inclined plane, and prepared to descend the well referred to by Pliny. The shaft is small; merely large enough to permit one to descend with the legs astride, the feet resting in little niches, and hands clinging to the same. Having no janizary with me to keep them off, I was very much annoyed by the Arabs following me. I had at first selected two as my guides, and told the others to go away; but it was of no use. They had nothing else to do; a few paras would satisfy them for their day's labour; and the chance of getting these, either from charity or by importunity, made them all follow. At the mouth of the well, I again selected my two guides, and again told the others not to follow; and, sending the two before me, followed down the well, being myself quickly followed by two others. I shouted to them to go back, but they paid no regard to me; so, coming out again, I could not help giving the fellow next me a blow with a club, which sent him bounding among his companions. I then flourished my stick among them, and after a deal of expostulation and threatening gesticulation, I attempted the descent once more. A second time they followed me, and I came out perfectly furious. My friend was outside shooting, the pyramids being nothing new to him, and unfortunately I had been obliged to leave Paul at Cairo, and had no one with me but a little Nubian boy. Him I could not prevail upon to descend the well; he was frightened, and begged me not to go down; and when he saw them follow the second time, and me come out and lay about me with a club, he began to cry, and, before I could lay hold of him, ran away. I could do nothing without him, and was obliged to follow. There was no use in battling with the poor fellows, for they made no resistance; and I believe I might have brained the whole of them without one offering to strike a blow. Moreover, it was very hot and smothering; and as there was nothing particular to see, nor any discovery to make, I concluded to give it up; and calling my guides to return, in a few moments escaped from the hot and confined air of the pyramid.

At the base I found my friend sitting quietly with his gun in his hand, and brought upon him the hornet's nest which had so worried me within. The Arabs, considering their work done, gathered around me, clamorous for bucksheesh, and none were more importunate than the fellows who had followed me so pertinaciously. I gave them liberally, but this only whetted their appetites. There was no getting rid of them; a sweep of my club would send them away for a moment, but instantly they would reorganise and come on again, putting the women and children in the front rank. The sheik came ostensibly to our relief; but I had doubts whether he did not rather urge them on. He, however, protected us to a certain extent, while we went into one of the many tombs to eat our luncheon. For a great distance around there are large tombs which would of themselves attract the attention of the traveller, were they not lost in the overwhelming interest of the pyramids. That in which we lunched had a deep shaft in the centre, leading to the pit where the mummies had been piled one upon another. The Arabs had opened and rifled the graves, and bones and fragments were still lying scattered around. Our persecutors were sitting at the door of the tomb looking in upon us, and devouring with their eyes every morsel that we put into our mouths. We did not linger long over our meal; and, giving them the fragments, set off for a walk round the pyramid of Cephrens, the second in grandeur.

This pyramid was opened at great labour and expense by the indefatigable Belzoni, and a chamber discovered containing a sarcophagus, as in that of Cheops. The passage, however, has now become choked up and hardly accessible. Though not so high, it is much more difficult to mount than the other, the outside being covered with a coat of hard and polished

cement, at the top almost perfectly smooth and unbroken. Two English officers had mounted it a few days before, who told me that they had found the ascent both difficult and dangerous. One of the Arabs who accompanied them, after he had reached the top, became frightened, and, not daring to descend, remained hanging on there more than an hour, till his old father climbed up and inspired him with confidence to come down.

A new attempt is now making to explore the interior of this pyramid. Colonel Vyse, an English gentleman of fortune, has devoted the last six months to this most interesting work. He has for an associate in his labours the veteran Caviglia, who returns to the pyramids rich with the experience of twenty years in exploring the temples and tombs of Upper Egypt. By a detailed report and drawing received by Mr Gliddon from Caviglia himself, and by private letters of later date, it appears that they have already discovered a new passage and another chamber, containing on one of the walls a single hieroglyphic. This hieroglyphic was then under the consideration of the savans and pupils of the Champolion school in Egypt; and whether they succeed in reading it or not, we cannot help promising ourselves the most interesting results from the enterprise and labours of Colonel Vyse and Caviglia.

The pyramids, like all the other works of the ancient Egyptians, are built with great regard to accuracy of proportion. The sepulchral chamber is not in the centre, but in an irregular and out-of-the-way position in the vast pile; and some idea may be formed of the great ignorance which must exist in regard to the whole structure and its uses, from the fact that by computation, allowing an equal solid bulk for partition walls, there is sufficient space in the great pyramid for 3700 chambers as large as that containing the sarcophagus.

Next to the pyramids, probably as old, and hardly inferior in interest, is the celebrated Sphinx. Notwithstanding the great labours of Caviglia, it is now so covered with sand that it is difficult to realise the bulk of this gigantic monument. Its head, neck, shoulders, and breasts, are still uncovered; its face, though worn and broken, is mild, amiable, and intelligent, seeming, among the tombs around it, like a divinity guarding the dead.

#### CHAPTER IV.

Journey up the Nile.—An Arab Burial.—Pilgrims to Mecca.—Trials of Patience.—A Hurricane on the Nile.—A Turkish Bath.

On the 1st of January I commenced my journey up the Nile. My boat was small, for greater convenience in rowing and towing. She was, however, about forty feet long, with two fine latteen sails, and manned by eight men, a rais or captain, and a governor or pilot. This was to be my home from Cairo to the Cataracts, or as long as I remained on the river. There was not a place where a traveller could sleep, and I could not expect to eat a meal or pass a night except on board; consequently, I was obliged to provide myself at Cairo with all things necessary for the whole voyage. My outfit was not very extravagant. It consisted, as near as I can recollect, of two tin cups, two pairs of knives and forks, four plates, coffee, tea, sugar, rice, macaroni, and a few dozen of claret. My bedroom furniture consisted of a mattress and coverlet, which in the daytime were tucked up so as to make a divan. Over the head of my bed were my gun and pistols, and at the foot was a little swinging shelf containing my LIBRARY, which consisted of the Modern Traveller in Egypt, Volney's Travels, and an Italian grammar and dictionary. My only companion was my servant; and as he is about to be somewhat intimate with me, I take the liberty of introducing him to the reader. Pnollo Nuzzo, or, more familiarly Paul, was a Maltese. I had met him at Constantinople travelling with two of my countrymen; and though they did not seem

to like him much, I was very well pleased with him, and thought myself quite fortunate, on my arrival at Malta, to find him disengaged. He was a man about thirty-five years old; stout, square built, intelligent; a passionate admirer of ruins, particularly the ruins of the Nile; honest and faithful as the sun, and one of the greatest cowards that luminary ever shone upon. He called himself my dragoman, and, I remember, wrote himself such in the convent of Mount Sinai and the temple at Petra, though he promised to make himself generally useful, and was my only servant during my whole tour. He spoke French, Italian, Maltese, Greek, Turkish, and Arabic, but could not read any one of these languages. He had lived several years in Cairo, and had travelled on the Nile before, and understood all the little arrangements necessary for the voyage.

At about twelve o'clock, then the hour when at home my friends were commencing their New-year visits, accompanied to the boat by my friend from Alexandria, my first, last, and best friend in Egypt, I embarked; and with a fair wind, and the "star-spangled banner" (made by an Arab tailor) floating above me, I commenced my journey on the Nile. It is necessary here for every stranger to place himself under the flag of his country, else his boat and men are liable to be taken at any moment by the officers of the pacha. It was the first time I had myself ever raised the banner of my country, and I felt a peculiar pride in the consciousness that it could protect me so far from home.

We started, as when I first embarked upon the Nile, with a fair wind, at sunset, and again to the gentle tap of the Arab drum we passed the great pyramids of Ghizeh and the giant monuments of Sachara and Dashoor. Long after sunset their dark outline was distinctly visible over the desert; I sat on the deck of my boat till their vast masses became lost in the darkness. My situation was novel and exciting, and my spirits were elated with curious expectation; but with the morrow came a very essential change. A feeling of gloom came over me when I found the wind against my progress. The current was still running obstinately the same way as before, and to be so soon deserted by the element that I needed, gave rather a dreary aspect to the long journey before me. That day, however, we contrived to do something; my boat being small, my men were almost continually ashore, with ropes around their breasts, towing; and, occasionally, rowing across from side to side would give us the advantage of a bend in the river, when we would carry sail and make some progress.

The scenery of the Nile, about fifty miles from Cairo, differed somewhat from the rich valley of the Delta, the dark mountains of Mokattam, in the neighbourhood of Cairo, bounding the valley on the Arabian side, while on the African the desert approached to the very banks of the river. Though travelling in a country in which, by poetic licence, and by way of winding off a period, every foot of ground is said to possess an exciting interest, during my first day's journey on the Nile I was thrown very much upon my own resources.

My gun was the first thing that presented itself. I had bought it in Cairo, double-barrelled and new, for fifteen dollars. I did not expect to make much use of it, and it was so very cheap that I was rather doubtful of its safety, and intended to make trial of it with a double charge and a slow match. But Paul had anticipated me; he had already put in two enormous charges, and sent one of the boatmen ashore to try it. I remonstrated with him upon the risk to which he had exposed the man; but he answered in the tone in which he (like all European servants) always spoke of the degraded inhabitants of Egypt—"Poh! he is only an Arab;" and I was soon relieved from apprehension by the Arab returning, full of praises of the gun, having killed with both shots. One thing disheartened me even more than the head wind. Ever since I left home

I had been in earnest search of a warm climate, and thought I had secured it in Egypt; but wherever I went, I seemed to carry with me an influence that chilled the atmosphere. In the morning, before I rose, Paul brought in to me a piece of ice as thick as a pane of glass, made during the night; a most extraordinary, and to me unexpected circumstance. The poor Arabs, accustomed to their hot and burning sun, shrank in the cold almost to nothing, and early in the morning and in the evening were utterly unfit for labour. I suffered very much also myself. Obligated to sit with the door of my cabin closed, my coat and greatcoat on, and with a prospect of a long cold voyage, by the evening of the second day I had lost some portion of the enthusiasm with which, under a well-filled sail, I had started the day before from Cairo.

The third day was again exceedingly cold, the wind still ahead, and stronger than yesterday. I was still in bed, looking through the many openings of my cabin, and the men were on shore towing, when I was roused by a loud voice of lamentation, in which the weeping and wailing of women predominated. I stepped out, and saw on the bank of the river the dead body of an Arab, surrounded by men, women, and children, weeping and howling over it previous to burial. The body was covered with a wrapper of coarse linen cloth, drawn tight over the head and tied under the neck, and fastened between two parallel bars, intended as a barrow to carry it to its grave. It lay a little apart before the group of mourners, who sat on the bank above, with their eyes turned towards it, weeping, and apparently talking to it. The women were the most conspicuous among the mourners. The dead man had been more happy in his connexions than I imagine the Arabs generally are, if all the women sitting there were really mourning his death. Whether they were real mourners, or whether they were merely going through the formal part of an Egyptian funeral ceremony, I cannot say; but the big tears rolled down their cheeks, and their cries sounded like the overflowings of distressed hearts. A death and burial scene is at any time solemn, and I do not know that it loses any of its solemnity even when the scene is on the banks of the Nile, and the subject a poor and oppressed Arab. Human affection probably glows as warmly here as under a gilded roof, and I am disposed to be charitable to the exhibition that I then beheld; but I could not help noticing that the cries became louder as I approached, and I had hardly seated myself at a little distance from the corpse before the women seemed to be completely carried away by their grief, and with loud cries, tearing their hair and beating their breasts, threw out their arms towards the corpse, and prayed, and wept, and then turned away, with shrieks piteous enough to touch the heart of the dead.

The general territorial division of Egypt, from time immemorial, has been into upper and lower; the latter beginning at the shores of the Mediterranean and extending very nearly to the ancient Memphis, and the former commencing at Memphis and extending to the Cataracts. Passing by, for the present, the ruins of Memphis, on the fourth day, the wind dead ahead, and the men towing at a very slow rate, I went ashore with my gun, and about eleven o'clock in the morning walked into the town of Beni Souef. This town stands on the Libyan side of the river, on the borders of a rich valley, the Nile running close under the foot of the Arabian mountains; and contains as its most prominent objects, a mosque and minaret, and what is here called a palace or seraglio; that is, a large coarse building covered with white cement, and having grated windows for the harem.

Here travellers sometimes leave their boats to make an excursion to Medineh el Fayoun, the ancient Crocodopolis, or Arsinoë, near the great Lake Mœris. This lake was in ancient days one of the wonders of Egypt. It was sixty miles long (about the size of the Lake of Geneva), and Herodotus says that it was an artificial lake, and that in his time the towering summits of two

pyramids were visible above its surface. The great labyrinth, too, was supposed to be somewhere near this; but no pyramids nor any ruins of the labyrinth are now to be seen. The lake is comparatively dry, and very little is left to reward the traveller.

At sundown we hauled up to the bank, alongside a boat loaded with pilgrims; and building a fire on shore, the two crews, with their motley passengers, spent the night quietly around it. It was the first time since we left Cairo that we had come in contact with pilgrims, although we had been seeing them from my first entering Egypt. This was the season for the pilgrimage to Mecca. The great caravan was already gathering at Cairo, while numbers not wishing to wait, were seen on all parts of the Nile on their way to Kenneh, from thence to cross the desert to Cossier, and down the Red Sea to the Holy City. They were coming from all parts of the Mussulman dominions, poor and rich, old and young, women and children, almost piled upon each other by scores, for several months exposing themselves to all manner of hardships, in obedience to one of the principal injunctions of the Koran, once in their lives to perform a pilgrimage to Mecca.

On the 5th the wind was still dead ahead; the men continued to tow, but without making much progress; and the day dragged heavily. On the 6th, I saw another burial. Early in the morning Paul called me to look out. We were lying in company with another boat, fast to a little island of sand nearly in the middle of the river. I got up exceedingly cold, and saw a dead man lying on the sand, his limbs drawn up and stiff. He was a boatman on board the other boat, and had died during the night. A group of Arabs were sitting near making coffee, while two were preparing to wash the body previous to burial. They brought it down to the margin of the river, and laid it carefully upon the sand, then washed it, pressed down the drawn-up legs, and wrapped it in fragments of tattered garments, contributed by his fellow-boatmen, who could ill spare even these scanty rags; and laying it with great decency a little way from the river, joined the other group, and sat down with great gravity to pipes and coffee. In a few moments two of them rose, and going a little apart, with their bare hands scratched a shallow grave; and the poor Arab was left on a little sandbank in the Nile, to be covered in another season by the mighty river. He was an entire stranger, having come on board the evening before his boat set out from Cairo. In all probability, he was one of an immense mass which swarms in the crowded streets of Cairo, without friends, occupation, or settled means of living.

On the 7th the wind was still ahead and blowing strong, and the air was very cold. Having no books, no society, and no occupation except talking with Paul and my boatmen, and the stragglers on shore, I became dispirited, and sat, hour after hour, wrapped in my greatcoat, deliberating whether I should not turn back. One of the most vexatious things was the satisfaction apparently enjoyed by all around me. If we hauled up alongside another boat, we were sure to find the crew sprawling about in a most perfect state of contentment, and seemingly grateful to the adverse wind that prevented their moving. My own men were very obedient, but they could not control the wind. I had a written contract with my rais, drawn up by a Copt in Cairo, in pretty Arabic characters, and signed by both of us, although neither knew a word of its contents. The captain's manner of signing, I remember, was very primitive; he dipped the end of his finger in the ink, and pressed it on the paper, and in so doing seemed to consider that he had sold himself to me almost body and soul. "I know I am obliged to go if Howega says so," was his invariable answer; but though perfectly ready to go whenever there was a chance, it was easy enough to see that they were all quite as contented when there was none. Several times I was on the point of turning back, the wind drew down the river so invitingly; but if I returned, it was too early to go into Syria; and Thebes, "Thebes with her hundred gates," beckoned me on.

On the 8th I had not made much more than fifty miles, and the wind was still ahead, and blowing stronger than ever; indeed, it seemed as if this morning, for the first time, it had really commenced in earnest. I became desperate and went ashore, resolved to wear it out. We were lying along the bank, on the Libyan side, in company with fifteen or twenty boats, wind-bound like ourselves. It was near a little mud village, of which I forget the name, and several Bedouin tents were on the bank, in one of which I was sitting smoking a pipe. The wind was blowing down with a fury I have never seen surpassed in a gale at sea, bringing with it the light sands of the desert, and at times covering the river with a thick cloud which prevented my seeing across it. A clearing up for a moment showed a boat of the largest class, heavily laden, and coming down with astonishing velocity; it was like the flight of an enormous bird. She was under bare poles, but small portions of the sail had got loose, and the Arabs were out on the very ends of the long spars getting them in. One of the boatmen, with a rope under his arm, had plunged into the river, and with strong swimming reached the bank, where a hundred men ran to his assistance. Their united strength turned her bows around, up stream, but nothing could stop her; stern foremost she dragged the whole posse of Arabs to the bank, and broke away from them perfectly ungovernable; whirling around, her bows pitched into our fleet with a loud crash, tore away several of the boats, and carrying one off, fast locked as in a death-grasp, she resumed her headlong course down the river. They had gone but a few rods, when the stranger pitched her bows under and went down in a moment, bearing her helpless companion also to the bottom. It was the most exciting incident I had seen upon the river. The violence of the wind, the swift movement of the boat, the crash, the wild figures of the Arabs on shore and on board, one in a red dress almost on the top of the long spar, his turban loose and streaming in the wind, all formed a strange and most animating scene. I need scarcely say that no lives were lost, for an Arab on the bosom of his beloved river is as safe as in his mud cabin.

On the 9th the wind was as contrary as ever; but between rowing and towing we had managed to crawl up as far as Minyeh. It was the season of the Ramadan, when for thirty days, from the rising to the setting of the sun, the followers of the Prophet are forbidden to eat, drink, or even smoke, or take the bath. My first inquiry was for a bath. It would not be heated or lighted up till eight o'clock; at eight o'clock I went, and was surprised to find it so large and comfortable. I was not long surprised, however, for I found that no sooner was the sacred prohibition removed, than the Turks and Arabs began to pour in in throngs; they came without any respect of persons, the haughty Turk with his pipe-bearing slave and the poor Arab boatman; in short, every one who could raise a few paras.

It was certainly not a very select company, nor over clean, and probably very few Europeans would have stood the thing as I did. My boatmen were all there. They were my servants, said the rais, and were bound to follow me every where. As I was a Frank, and as such expected to pay ten times as much as any one else, I had the best place in the bath, at the head of the great reservoir of hot water. My white skin made me a marked object among the swarthy figures lying around me; and half a dozen of the operatives, lank, bony fellows, and perfectly naked, came up and claimed me. They settled it among themselves, however, and gave the preference to a dried-up old man more than sixty, a perfect living skeleton, who had been more than forty years a scrubber in the bath. He took me through the first process of rubbing with the glove and brush; and having thrown over me a copious ablution of warm water, left me to recover at leisure. I lay on the marble that formed the border of the reservoir, only two or three inches above the surface of the water, into which I put my hand and found it excessively hot; but the

old man, satisfied with his exertion in rubbing me, sat on the edge of the reservoir, with his feet and legs hanging in the water, with every appearance of satisfaction. Presently he slid off into the water, and, sinking up to his chin, remained so a moment, drew a long breath, and seemed to look around him with a feeling of comfort. I had hardly raised myself on my elbow to look at this phenomenon, before a fine brawny fellow, who had been lying for some time torpid by my side, rose slowly, slid off like a turtle, and continued sinking, until he, too, had immersed himself up to his chin. I expressed to him my astonishment at his ability to endure such heat; but he told me that he was a boatman, had been ten days coming up from Cairo, and was almost frozen, and his only regret was that the water was not much hotter. He had hardly answered me before another and another followed, till all the dark naked figures around me had vanished. By the fitful glimmering of the little lamps, all that I could see was a parcel of shaved heads on the surface of the water, at rest or turning slowly and quietly as on pivots. Most of them seemed to be enjoying it with an air of quiet dreamy satisfaction; but the man with whom I had spoken first, seemed to be carried beyond the bounds of Mussulman gravity. It operated upon him like a good dinner; it made him loquacious, and he urged me to come in, nay he even became frolicsome; and, making a heavy surge, threw a large body of the water over the marble on which I was lying. I almost screamed, and started up as if melted lead had been poured upon me; even while standing up, it seemed to blister the soles of my feet, and I was obliged to keep up a dancing movement, changing as fast as I could, to the astonishment of the dozing bathers, and the utter consternation of my would-be friend. Roused too much to relapse into the quiet luxury of perspiration, I went into another apartment, of a cooler temperature, where, after remaining in a bath of moderately warm water, I was wrapped up in hot cloths and towels, and conducted into the great chamber. Here I selected a couch, and, throwing myself upon it, gave myself to the operators, who now took charge of me, and well did they sustain the high reputation of a Turkish bath; my arms were gently laid upon my breast, where the knee of a powerful man pressed upon them; my joints were cracked and pulled; back, arms, the palms of the hands, the soles of the feet, all visited in succession. I had been shampooed at Smyrna, Constantinople, and Cairo; but who would have thought of being carried to the seventh heaven at the little town of Minyeh? The men who had me in hand were perfect amateurs, enthusiasts, worthy of rubbing the hide of the sultan himself; and the pipe and coffee that followed were worthy, too, of that same mighty seigneur. The large room was dimly lighted, and, turn which way I would, there was a naked body, apparently without a soul, lying torpid, and tumbled at will by a couple of workmen. I had had some fears of the plague; and Paul, though he felt his fears gradually dispelled by the soothing process which he underwent also, to the last continued to keep particularly clear of touching any of them. But I left the bath a different man; all my moral as well as physical strength was roused; I no longer drooped or looked back; and though the wind was still blowing a hurricane in my teeth, I was bent upon Thebes and the Cataracts.

## CHAPTER V.

Sporting on the Nile.—A Recluse.—An Egyptian Hebe.—Siout.—A Wolf-race among the Tombs.—Adventure with a Governor.

January 13.—In the morning, the first thing I did was to shoot at a flock of ducks, the next to shoot at a crocodile. He was the first I had seen, and was lying on a sandbank on an island in the middle of the river. I might as well have thrown a stone at him, for he was out of range twice over, and his hard skin would have laughed at my bird-shot, even if I had hit him; but I did what every traveller on the Nile must do, I shot at a crocodile. I met several travellers, all abundantly

provided with materials, and believe we were about equally successful. I never killed any, nor did they. During the day the wind abated considerably, and towards evening it was almost calm. My boat rowed as easily as a barge, and we were approaching Manfaloot. For some time before reaching it, there is a change in the appearance of the river.

The general character of the scenery of the Nile is that of a rich valley, from six to eight or ten miles wide, divided by the river, and protected on either side from the Libyan and Arabian Deserts by two continuous and parallel ranges of mountains. These are the strongly marked and distinguishing features; and from Cairo to the Cataracts, almost the only variety is that occasioned by the greater or less distance of these two ranges. Before approaching Manfaloot they changed their direction, and on the Arabian side the dark mountains of Mokattam advanced to the very border of the river.

Here we began to approach the eternal monuments of Egyptian industry. For a long distance the high range of rocky mountain was lined with tombs, their open doors inviting us to stop and examine them; but most provokingly, now, for the first time since the day we started, the wind was fair. It had been my peculiarly bad luck to have a continuance of headwinds on a part of the river where there was nothing to see; and almost the very moment I came to an object of interest, the wind became favourable, and was sweeping us along beautifully. One of the few pieces of advice given me at Cairo, of which my own observation taught me the wisdom, was, with a fair wind never to stop going up; and though every tomb seemed to reproach me for my neglect, we went resolutely on.

In one of the tombs lives an old man, who has been there more than fifty years; and an old wife, his companion for more than half a century, is there with him. His children live in Upper Egypt, and once a-year they come to visit their parents. The old man is still hale and strong; at night a light is always burning in his tomb, a basket is constantly let down to receive the offerings of the charitable, and few travellers, even among the poor Arabs, ever pass without leaving their mites for the recluse of the sepulchres.

It was dark when we arrived at Manfaloot, but, being the season of the Ramadan, the Mussulman day had just begun; the bazaars were open, and the cook and coffee shops thronged with Turks and Arabs indemnifying themselves for their long abstinence. My boatmen wanted to stop for the night; but as I would not stop for my own pleasure at the tombs below, I of course would not stop here for theirs; and after an hour or two spent in lounging through the bazaars and making a few necessary purchases, we were again under way.

At about eight o'clock, with a beautiful wind, I sailed into the harbour of Siout. This is the largest town on the Nile, and the capital of Upper Egypt. Brighter prospects now opened upon me. The wind that had brought us into Siout, and was ready to carry us on farther, was not the cold and cheerless one that for more than two weeks had blown in my teeth, but mild, balmy, and refreshing, raising the drooping head of the invalid, and making the man in health feel like walking, running, climbing, or clearing fences on horseback. Among the bourriquières who surrounded me the moment I jumped on the bank, was a beautiful bright-eyed little Arab girl, about eight years old, leading a donkey, and flourishing a long stick with a grace that would have shamed the best pupil of a fashionable dancing-master. By some accident, moreover, her face and hands were clean, and she seemed to be a general favourite among her ragged companions, who fell back with a gallantry and politeness that would have done honour to the ballroom of the dancing-master aforesaid. Leaving her without a competitor, they deprived me of the pleasure of showing my preference; and putting myself under her guidance, I followed her nimble little feet on the road to Siout. I make special mention of this little girl, because it is a rare thing to see an Egyp-

tian child in whom one can take any interest. It was the only time such a thing ever occurred to me; and really she exhibited so much beauty and grace, such a mild, open, and engaging expression, and such propriety of behaviour, as she walked by my side, urging on the donkey, and looking up in my face when I asked her a question, that I felt ashamed of myself for riding while she walked. But, tender and delicate as she looked, she would have walked by the side of her donkey, and tired down the strongest man. She was, of course, the child of poor parents, of whom the donkey was the chief support. The father had been in the habit of going out with it himself, and frequently taking the little girl with him as a companion. As she grew up, she went out occasionally alone, and even among the Turks her interesting little figure made her a favourite; and when all the other donkeys were idle, hers was sure to be engaged. This, and many other things, I learned from her own pretty little lips on my way to Siout.

Siout stands about a mile and a half from the river, in one of the richest valleys of the Nile. At the season of inundation, when the river rolls down in all its majesty, the whole intermediate country is overflowed; and boats of the largest size, steering their course over the waste of waters by the projecting tops of the palm-trees, come to anchor under the walls of the city. A high causeway from the river to the city crosses the plain, a comparatively unknown and unnoticed, but stupendous work, which for more than 3000 years has resisted the headlong current of the Nile at its highest, and now stands, like the pyramids, not so striking, but an equally enduring, and perhaps more really wonderful, monument of Egyptian labour. A short distance before reaching the city, on the right, are the handsome palace and garden of Ibrahim Pacha. A stream winds through the valley, crossed by a stone bridge, and over this is the entrance-gate of the city. The governor's palace, the most imposing and best structure I had seen since the citadel at Cairo, standing first within the walls, seemed like a warder at the door.

The large courtyard before the door of the palace contained a group of idlers, mostly officers of the household, all well armed, and carrying themselves with the usual air of Turkish conceit and insolence. Sitting on one side, with large turbans and long robes, unarmed, and with the large brass inkhorn by their sides, the badge of their peaceful and inferior, if not degrading profession, was a row of Copts, calling themselves, and believed to be, the descendants of the ancient Egyptians, having, as they say, preserved their blood intact during all the changes of their country. Boasting the blood of the ancient Egyptians, with the ruins of the mighty temples in which they worshipped, and the mighty tombs in which they were buried, staring them in the face, they were sitting on the bare earth at the door of a petty delegate of a foreign master, a race of degraded beggars, lifeless and soulless, content to receive, as a grace from the hands of a tyrant, the wretched privilege of living as slaves in the land where their fathers reigned as masters.

I do not believe that the contents of all the bazaars in Siout, one of the largest towns in Egypt, were worth as much as the stock of an ordinary dealer in dry goods in Broadway. But these are not the things for which the traveller stops at Siout. On the lofty mountains overlooking this richest valley of the Nile, and protecting it from the Libyan Desert, is a long range of tombs, the burial-place of the ancient Egyptians; and looking for a moment at the little Mahomedan burying-ground, the traveller turns with wonder from the little city he has left, and asks, Where is the great city which had its graves in the sides of yonder mountains? Where are the people who despised the earth as a burial-place, and made for themselves tombs in the eternal granite?

The mountain is about as far from the city as the river, and the approach to it is by another strong causeway over the same beautiful plain. Leaving our donkeys at its foot, and following the nimble footsteps of my little

Arab girl, we climbed by a steep ascent to the first range of tombs. They were the first I had seen, and are but little visited by travellers; and though I afterwards saw all that were in Egypt, I still consider these well worth a visit. Of the first we entered, the entrance chamber was perhaps forty feet square, and adjoining it, in the same range, were five or six others, of which the entrance-chambers had about the same dimensions. The ceilings were covered with paintings, finished with exquisite taste and delicacy, and in some places fresh as if just executed; and on the walls were hieroglyphics enough to fill volumes. Behind the principal chamber were five or six others nearly as large, with smaller ones on each side, and running back perhaps 150 feet. The back chambers were so dark, and their atmosphere was so unwholesome, that it was unpleasant, and perhaps unsafe, to explore them; if we went in far, there was always a loud rushing noise, and, as Paul suggested, their innermost recesses might now be the abode of wild beasts. Wishing to see what caused the noise, and at the same time to keep out of harm's way, we stationed ourselves near the back-door of the entrance chamber, and I fired my gun within; a stream of fire lighted up the darkness of the sepulchral chamber, and the report went grumbling and roaring into the innermost recesses, rousing their occupants to phrensy. There was a noise like the rushing of a strong wind; the light was dashed from Paul's hand; a soft skinny substance struck against my face; and thousands of bats, wild with fright, came whizzing forth from every part of the tomb to the only avenue of escape. We threw ourselves down, and allowed the ugly frightened birds to pass over us, and then hurried out ourselves. For a moment I felt guilty, the beastly birds, driven to the light of day, were dazzled by the glorious sun, and, flying and whirling blindly about, were dashing themselves against the rocky side of the mountain, and falling dead at its base. Cured of all wish to explore very deeply, but at the same time relieved from all fears, we continued going from tomb to tomb, looking at the pictures on the walls, endeavouring to make out the details, admiring the beauty and freshness of the colours, and speculating upon the mysterious hieroglyphics which mocked our feeble knowledge. We were in one of the last when we were startled by a noise different from any we had yet heard, and from the door leading to the dark recesses within, foaming, roaring, and gnashing his teeth, out ran an enormous wolf: close upon his heels, in hot pursuit, came another, and almost at the door of the tomb they grappled, fought, growled fearfully, rolled over, and again the first broke loose and fled; another chase along the side of the mountain, another grapple, a fierce and desperate struggle, and they rolled over the side, and we lost sight of them. The whole affair had been so sudden, the scene so stirring, and the interest so keen, that Paul and I had stood like statues, our whole souls thrown into our eyes, and following the movements of the furious beasts. Paul was the first to recover himself; and as soon as the wolves were fairly out of sight, with a characteristic movement, suddenly took the gun out of my hand, and started in pursuit. It is needless to say that he did not go far.

But the interest of the day was not yet over. While walking along the edge of the mountain, in spite of bats and beasts, still taking another and another look, my ears were suddenly struck with a loud voice of lamentation coming up from the valley below; and looking in the direction of the city, I saw approaching over the elevated causeway a long funeral procession, and the voice came from the mourners following the corpse. They were evidently coming to the Mahomedan burying-ground at the foot of the mountain; and I immediately left the tombs of the ancient Egyptians to see the burial of one who but yesterday was a dweller in the laud.

Being far beyond the regular path for descending, and wishing to intercept the procession before its arrival at the burying-ground, I had something like the

wolf-race I had just beheld to get down in time; unluckily, I had sent Paul back to the place where we had left our cloaks and donkeys, and the little girl, with directions to ride round the foot of the hill and meet me at the burying-ground. How I got down I do not know; but I was quietly sitting under a large palm-tree near the cemetery when the procession came up. It approached with funeral banners and devices which I could not make out, but probably containing some precept of the Koran, having reference to death, and the grave, and a paradise of hours; and the loud wailing which had reached me on the top of the mountain, here was almost deafening. First in the strange procession came the beggars, or santons, men who are supposed to lead peculiarly pure and holy lives, denying themselves all luxuries and pleasures, labouring not, and taking no heed for themselves what they shall eat or what they shall drink, and living upon the willing, though necessarily stinted charity, of their miserable countrymen. I could read all this at the first glance; I could see that poverty had been their portion through life; that they had drunk the bitter cup to its very dregs. Their beards were long, white, and grizzled; over their shoulders and breasts they wore a scanty covering of rags, fastened together with strings, and all with some regard to propriety. This ragged patchwork covered their breasts and shoulders only, the rest of their bodies being entirely naked, and they led the funeral procession among a throng of spectators, with heads erect and proud step, under what, any where else, would be called an indecent and shameless exposure of person, unbecoming their character as saints or holy beggars. Over their shoulders were slung by ropes large jars of water, which for charity's sweet sake, and for the love of the soul of the deceased, they carried to distribute gratis at his grave. After them came a parcel of boys, then the sheiks and two officers of the town, then the corpse, tightly wrapped from head to foot in a red sash, on a bier carried by four men; then a procession of men, and more than a hundred women in long cotton dresses, covering their heads and drawn over their faces, so as to hide all except their eyes.

These were the last, but by no means the least important part of the procession, as, by general consent, the whole business of mourning devolved upon them; and the poor Arab who was then being trundled to his grave, had no reason to complain of their neglect. Smiles and tears are a woman's weapons; and she is the most to be admired, and has profited most by the advantage of education, who knows how to make the best use of them. Education and refinement can no doubt do wonders; but the most skillful lady in civilised life might have taken lessons from these untutored Egyptians. A group of them were standing near me, chattering and laughing until the procession came up, when all at once big tears started from their eyes, and their cries and lamentations rent the air as if their hearts were breaking. I was curious to see the form of a modern burial in Egypt, but I hesitated in following. Some of the Arabs had looked rudely at me in passing, and I did not know whether the bigoted Mussulmans would tolerate the intrusion of a stranger and a Christian. I followed on, however, looking out for Paul, and fortunately met him at the gate of the burying-ground. The sheik was standing outside, ordering and arranging; and I went up to him with Paul, and asked if there were any objection to my entering; he not only permitted it, but, telling me to follow him, with a good deal of noise and an unceremonious use of the scabbard of his sword, he cleared a way through the crowd; and even roughly breaking through the ranks of the women, so as materially to disturb their business of mourning, and putting back friends and relations, gave me a place at the head of the tomb. It was square, with a round top, built of Nile mud, and whitewashed; two men were engaged in opening it, which was done simply by pulling away a few stones, and scooping out the sand with their hands. In front, but a few feet from the door, sat the old mother, so old

as to be hardly conscious of what was passing around her, and probably, long before this, buried in the same grave; near her was the widow of the deceased, dressed in silk, and sitting on the bare earth with an air of total abandonment; her hands, her breast, the top of her head and her face, plastered with thick coats of mud, and her eyes fixed upon the door of the tomb. A few stones remained to be rolled away, and the door, or rather the hole, was opened; the two men crawled in, remained a minute or two, came out, and went for the corpse. The poor widow followed them with her eyes, and when they returned with the body, carefully and slowly dragging it within the tomb, and the feet and the body had disappeared, and the beloved head was about to be shut for ever from her eyes, she sprang up, and passionately throwing her arms towards the tomb, broke forth in a perfect phrensy of grief. "Twenty years we have lived together; we have always lived happily; you loved me, you were kind to me, you gave me bread; what shall I do now? I will never marry again. Every day I will come and weep at your tomb, my love, my life, my soul, my heart, my eyes. Remember me to my father, remember me to my brother," &c. &c. I do not remember half she said; but as Paul translated it to me, it seemed the very soul of pathos; and all this time she was walking distractedly before the door of the tomb, wringing her hands, and again and again plastering her face and breast with mud. The mourning women occasionally joined in chorus, the santons ostentatiously crying out, "Water, for the love of God and the Prophet, and the soul of the deceased;" and a little girl about seven or eight years old was standing on the top of the tomb, naked as she was born, eating a piece of sugar cane. Paul looked rather suspiciously upon the whole affair, particularly upon that part where she avowed her determination never to marry again. "The old Beelzebub," said he; "she will marry to-morrow, if any one asks her."

Leaving the burying ground, we returned to Siout. On my way I made acquaintance with the governor, not only of that place, but also of all Upper Egypt, a pacha with two or three tails; a great man by virtue of his office, and much greater in his own conceit. I saw coming towards me a large, fine-looking man, splendidly dressed, mounted on a fine horse, with two runners before him, and several officers and slaves at his side. I was rather struck with his appearance, and looked at him attentively as I passed, without, however, saluting him, which I would have done had I known his rank. I thought he returned my gaze with interest; and, in passing, each continued to keep his eyes fixed upon the other, to such a degree that we must either have twisted our necks off or turned our bodies. The latter was the easier for both; and we kept turning, he on horseback and I on foot, until we found ourselves directly facing each other, and then both stopped. His guards and attendants turned with him, and, silent as statues, stood looking at me. I had nothing to say, and so I stood and said nothing. His mightiness opened his lips, and his myrmidons, with their hands on their sword-hilts, looked as if they expected an order to deal with me for my unparalleled assurance. His mightiness spoke, and I have no doubt but the Turks around him thought it was the *ne plus ultra* of dignity, and wondered such words had not confounded me. But it was not very easy to confound me with words I could not understand, although I could perceive that there was nothing very gracious in his manner. Paul answered, and, after the governor had turned his back, told me that his first address was, "Do I owe you any thing?" which he followed up by slapping his horse on the neck, and saying, in the same tone, "Is this your horse?" Paul says that he answered in a tone of equal dignity, "A cat may look at a king;" though, from his pale cheeks and quivering lips, I am inclined to doubt whether he gave so doughty a reply.

I was exceedingly amused at the particulars of the interview, and immediately resolved to cultivate the acquaintance. During the long days and nights of my

voyage up the Nile, in poring over my books and maps, I had frequently found my attention fixed upon the great Oasis in the Libyan Desert. A caravan road runs through it from Siout, and I resolved, since I had had the pleasure of one interview with his excellency, to learn from him the particulars of time, danger, &c. I therefore hurried down to the boat for my firman, and, strong in this as if I had the pacha at my right hand, I proceeded forthwith to the palace; but my friend observed as much state in giving audience as the pacha himself. Being the season of the Ramadan, he received nobody on business until after the evening meal, and so my purpose was defeated. Several were already assembled at the gate, waiting the appointed hour; but it did not suit my humour to sit down with them and exercise my patience, and perhaps feel the littleness of Turkish tyranny in being kept to the last, so I marched back to my boat.

It was still an hour before sunset; my men had laid in their stock of bread, the wind was fair, a boat of the largest size, belonging to a Turkish officer, with a long red satin flag, was just opening her large sails to go up the river, and bidding good-bye to my little Arab girl, we cast off our fastening to the bank at Siout. It was the first day I had spent on shore in the legitimate business of a tourist, and by far the most pleasant since I left Cairo.

## CHAPTER VI.

Small Favours thankfully received.—Slavery in Egypt.—How to catch a Crocodile.—An elaborate Joke.—Imaginary Perils.—Arabs not so bad as they might be.

The next day, at about four o'clock, we arrived at Djiddeh, formerly the capital of Upper Egypt, and the largest town on the Nile. My humour for going to the Oasis had been growing upon me, and, finding that there was a track from this place also, I landed, and working my way through the streets and bazaars, went to the governor's palace. As I before remarked, the place where the governor lives is always, by extraordinary courtesy, called a palace.

The governor was not at home; he had gone to Siout, on a visit to my handsome friend the governor there, but he had left his deputy, who gave us such an account of the journey and its perils as almost put an end to it for ever, at least so far as Paul was concerned. He said that the road was dangerous, and could not be travelled except under the protection of a caravan or guard of soldiers; that the Arabs among the mountains were a fierce and desperate people, and would certainly cut the throats of any unprotected travellers. He added, however, that a caravan was about forming, which would probably be ready in four or five days, and that, perhaps, before that time, the governor would return and give me a guard of soldiers. It did not suit my views to wait the uncertain movements of a caravan, nor did it suit my pocket to incur the expense of a guard. So, thanking the gentleman for his civility (he had given us pipes and coffee, as usual), I bade him good-bye, and started for my boat; but I had not gone far before I found him trotting at my heels. In the palace he had sat with his legs crossed, with as much dignity as the governor himself could have displayed; but as soon as he slid down from the divan, he seemed to have left dignity for his betters, and pounced upon Paul for "bucksheesh." I gave him five piasters (about equal to a quarter of a dollar), for which the deputy of the governor of Djiddeh, formerly the capital of Upper Egypt, laid his hand upon his heart, and invoked upon my head the blessing of Allah and the prophet.

At Djiddeh, for the first time, I saw carried on one of the great branches of trade on the Nile, a trade which once stained the annals of our own country, and the fatal effects of which we still continue to experience. There were two large boat-loads—perhaps 500 or 600 slaves—collected at Dongola and Senaar, probably bought from their parents for a shawl, a string of beads, or some trifling article of necessity. Born under the

burning sun of the tropics, several of them had died of cold even before reaching the latitude of Lower Egypt; many were sick, and others dying. They were arranged on board the boats and on the banks in separate groups, according to their state of health. Among them was every variety of face and complexion, and it was at once startling and painful to note the gradations of man descending to the brute. I could almost see the very line of separation. Though made in God's image, there seemed no ray of the divinity within them. They did not move upon all-fours, it is true, but they sat, as I had seen them in the slave-market at Cairo, perfectly naked, with their long arms wound round their legs, and their chins resting upon their knees, precisely as we see monkeys, baboons, and apes; and as, while looking at these miserable caricatures of our race, I have sometimes been almost electrified by a transient gleam of resemblance to humanity, so here I was struck with the closeness of man's approach to the inferior grade of animal existence. Nor was there much difference between the sick and well; the sick were more pitiable, for they seemed doomed to die, and death to any thing that lives is terrible; but the strong and lusty, men and women, were bathing in the river; and when they came out they smeared themselves with oil, and laid their shining bodies in the sun, and slept like brutes. To such as these, slavery to the Turk is not a bitter draught; philanthropists may refine and speculate, and liberals declaim, but what is liberty to men dying for bread, and what hardship is there in being separated from the parents who have sold them, or doomed to labour where that labour is light compared with what they must endure at home?

In the East slavery exists now precisely as it did in the days of the patriarchs. The slave is received into the family of a Turk in a relation more confidential and respectable than that of an ordinary domestic; and when liberated, which very often happens, stands upon the same footing with a free man. The curse does not rest upon him for ever; he may sit at the same board, dip his hand in the same dish, and, if there are no other impediments, may marry his master's daughter.

In the evening we left Djiddah, and about ten o'clock hauled up to the bank, and rested quietly till morning. Next day the wind was fair, but light, and I passed it on shore with my gun. This same gun, by the way, proved a better companion to me on my journey than I had expected. There were always plenty of pigeons; indeed, advancing in Upper Egypt, one of the most striking features in the villages on the Nile is the number of pigeon-cots, built of mud in the form of a sugar-loaf, and whitewashed. They are much more lofty than any of the houses, and their winged tenants constitute a great portion of the wealth of the villagers. It is not, however, allowable to shoot at these, the laws regulating the right of property in animals *feræ nature* being as well established on the banks of the Nile as at Westminster Hall; but there are hundreds of pigeons in the neighbourhood of every village which no one claims. In some places, too, there is fine sport in hunting hares; and if a man can bring himself to it, he may hunt the gazelle; and almost the whole line of the river, at least above Siout, abounds with ducks and geese. These, however, are very wild, and, moreover, very tough; and, except for the sport, are not worth shooting. No keeping and no cooking could make them tender, and good masticators were thrown away upon them.

But the standing shots on the Nile are crocodiles and pelicans. The former still abound, as in the days when the Egyptian worshipped them; and as you see one basking in the sun, on some little bank of sand, even in the act of firing at him, you cannot help going back to the time when the passing Egyptian would have bowed to him as to a god; and you may imagine the descendant of the ancient river-god, as he feels a ball rattling against his scaly side, invoking the shades of his departed worshippers, telling his little ones of the glory of his ancestors, and cursing the march of improvement,

which has degraded him from the deity of a mighty people into a target for strolling tourists. I always liked to see a crocodile upon the Nile, and always took a shot at him, for the sake of the associations. In one place I counted in sight at one time twenty-one, a degree of fruitfulness in the river probably equal to that of the time when each of them would have been deemed worthy of a temple while living, and embalment and a mighty tomb when dead.

While walking by the river-side, I met an Arab with a gun in his hand, who pointed to the dozing crocodiles on a bank before us, and, marking out a space on the ground, turned to the village a little back, and made me understand that he had a large crocodile there. As I was some distance in advance of my boat, I accompanied him, and found one fourteen feet long, stuffed with straw, and hanging under a palm-tree. He had been killed two days before, after a desperate resistance, having been disabled with bullets, and pierced with spears in a dozen places. I looked at him with interest and compassion, reflecting on the difference between his treatment and that experienced by his ancestors, but nevertheless opened a negotiation for a purchase; and though our languages were as far apart as our countries, bargain sharpens the intellect to such a degree that the Arab and I soon came to an understanding, and I bought him as he hung, for forty piasters and a charge of gunpowder. I had conceived a joke for my own amusement. A friend had requested me to buy for him some mosaics, cameos, &c., in Italy, which circumstances had prevented me from doing, and I had written to him, regretting my inability, and telling him that I was going to Egypt, and would send him a mummy or a pyramid; and when I saw the scaly monster hanging by the tail, with his large jaws distended by a stick, it struck me that he would make a still better substitute for cameos and mosaics, and that I would buy him up, and, without any advice, send him to my friend.

The reader may judge how desperately I was pushed for amusement, when I tell him that I chuckled greatly over this happy conceit; and having sent my Nubian to hail the boat as she was coming by, I followed with my little memorial. The whole village turned out to escort us, more than a hundred Arabs, men, women, and children, and we dragged him down with a pomp and circumstance worthy of his better days. Paul looked a little astonished when he saw me with a rope over my shoulder, leading the van of this ragged escort, and rather turned up his nose when I told him my joke. I had great difficulty in getting my prize on board, and, when I got him there, he deranged every thing else; but the first day I was so tickled that I could have thrown all my other cargo overboard rather than him. The second day the joke was not so good, and the third I grew tired of it, and tumbled my crocodile into the river. I followed him with my eye as his body floated down the stream; it was moonlight, and the creaking of the water-wheel on the banks sounded like the moaning spirit of an ancient Egyptian, indignant at the murder and profanation of his god. It was, perhaps, hardly worth while to mention this little circumstance, but it amused me for a day or two, brought me into mental contact with my friends at home, and gave me the credit of having myself shot a crocodile, any one of which was worth all the trouble it cost me. If the reader will excuse a bad pun, in consideration of its being my first and last, it was not a *dry* joke; for in getting the crocodile on board I tumbled over, and, very unintentionally on my part, had a January bath in the Nile.

During nearly the whole of that day, I was walking on the bank of the river; there was more tillable land than usual on the Arabian side, and I continually saw the Arabs, naked or with a wreath of grass around their loins, drawing water to irrigate the ground, in a basket fastened to a pole, like one of our old-fashioned well-poles.

On the 17th we approached Dendera. I usually

dined at one o'clock, because it was then too hot to go on shore, and also, to tell the truth, because it served to break the very long and tedious day. I was now about four hours from Dendera by land, of which two and a half were desert, the Libyan sands here coming down to the river. It was a fine afternoon, there was no wind, and I hoped, by walking, to have a view of the great temple before night. It was warm enough then; but as it regularly became very cold towards evening, I told my Nubian to follow me with my cloak. To my surprise, he objected. It was the first time he had done so. He was always glad to go ashore with me, as indeed were they all, and it was considered that I was showing partiality in always selecting him. I asked one of the others, and found that he, and in fact all of them, made objections, on the ground that it was a dangerous road.

This is one of the things that vex a traveller in Egypt, and in the East generally. He will often find the road which he wishes to travel a dangerous one, and, though no misadventure may have happened on it for years, he will find it impossible to get his Arabs to accompany him. My rais took the matter in hand, began kicking them ashore, and swore they should all go. This I would not allow. I knew that the whole course of the Nile was safe as the streets of London; that no accident had happened to a traveller since the pacha had been on the throne; and that women and children might travel with perfect safety from Alexandria to the Cataracts; and, vexed with their idle fears, after whipping Paul over their shoulders, who I saw was quite as much infected as any of them, I went ashore alone. Paul seemed quietly making up his mind for some desperate movement; without a word, he was arranging the things about the boat, shutting up the doors of the cabin, buttoning his coat, and with my cloak under his arm and a sword in his hand, he jumped ashore and followed me. He had not gone far, however, before his courage began to fail. The Arabs, whom we found at their daily labour drawing water, seemed particularly black, naked, and hairy. They gave dubious and suspicious answers, and when we came to the edge of the desert, he began to grumble outright; he did not want to be shot down like a dog; if we were strong enough to make a stout resistance, it would be another thing, &c. &c. In truth, the scene before us was dreary enough, the desert commencing on the very margin of the river, and running back to the eternal sands of Africa. Paul's courage seemed to be going with the green soil we were leaving behind us; and as we advanced where the grass seemed struggling to resist the encroachments of the desert, he was on the point of yielding to the terror of his own imagination, until I suggested to him that we could see before us the whole extent of desert we were to cross; that there was not a shrub or bush to interrupt the view, and not a living thing moving that could do us harm. He then began to revive; it was not for himself, but for me he feared. We walked on for about an hour, when, feeling that it was safe to trust me alone, and being tired, he sat down on the bank, and I proceeded. Fear is infectious. In about half an hour more I met three men, who had to me a peculiarly cut-throat appearance; they spoke, but I, of course, could not understand them. At length, finding night approaching, I turned back to meet the boat, and saw that the three Arabs had turned too, and were again advancing to meet me, which I thought a very suspicious movement. Paul's ridiculous fears had completely infected me, and I would have dodged them if I could; but there was no bush to hide behind. I almost blushed at myself for thinking of dodging three Arabs, when I had a double-barrelled gun in my hand and a pair of pistols in my sash; but I must say I was not at all sorry, before I met them again, to hear Paul shouting to me, and a moment after to see my boat coming up under full sail.

One who has never met an Arab in the desert, can have no conception of his terrible appearance. The worst pictures of the Italian bandits or Greek moun-

tain robbers I ever saw are tame in comparison. I have seen the celebrated Gasperini, who ten years ago kept in terror the whole country between Rome and Naples, and who was so strong as to negotiate and make a treaty with the pope. I saw him surrounded by nearly twenty of his comrades; and when he told me he could not remember how many murders he had committed, he looked civil and harmless compared with a Bedouin of the desert. The swarthy complexion of the latter, his long beard, his piercing coal-black eyes, half-naked figure, an enormous sword slung over his back, and a rusty matchlock in his hand, make the best figure for a painter I ever saw; but, happily, he is not so bad as he looks to be.

## CHAPTER VII.

The Temple of Dendera.—Practice against Theory.—Regulating the Sun.—The French at Thebes.—The Curse of Pharaoh.—An Egyptian Tournament.—Preparations for Dinner.—An English travelling Lady.

*Sunday, January 18.*—At eight o'clock in the morning we arrived at Gheneh, where, leaving my boat and crew to make a few additions to our stock, Paul and I crossed over in a sort of ferry-boat to Dendera.

The temple of Dendera is one of the finest specimens of the arts in Egypt, and the best preserved of any on the Nile. It stands about a mile from the river, on the edge of the desert, and coming up, may be seen at a great distance. The temples of the Egyptians, like the chapels in Catholic countries, in many instances stand in such positions as to arrest the attention of the passer-by; and the Egyptian boatman, long before he reached it, might see the open doors of the temple of Dendera, reminding him of his duty to the gods of his country. I shall not attempt any description of this beautiful temple; its great dimensions, its magnificent propylon or gateway, portico, and columns; the sculptured figures on the walls; the spirit of the devices, and their admirable execution; the winged globe and the sacred vulture; the hawk and the ibis, Isis, Osiris, and Horus, gods, goddesses, priests, and women; harps, altars, and people clapping their hands; and the whole interior covered with hieroglyphics and paintings, in some places, after a lapse of more than 2000 years, in colours fresh as if but the work of yesterday.

It was the first temple I had seen in Egypt; and although I ought not perhaps to say so, I was disappointed. I found it beautiful, far more beautiful than I expected; but look at it as I would, wander around it as I would, the ruins of the Acropolis at Athens rose before me; the severe and stately form of the Parthenon; the beautiful fragment of the temple of Minerva, and the rich Corinthian columns of the temple of Jupiter, came upon me with a clearness and vividness I could not have conceived. The temple is more than half buried in the sand. For many years it has formed the nucleus of a village. The Arabs have built their huts within and around it, range upon range, until they reached and almost covered the tops of the temple. Last year, for what cause I know not, they left their huts in a body, and the village, which for many years had existed there, is now entirely deserted. The ruined huts still remain around the columns and against the broken walls. On the very top is a chamber, beautifully sculptured, and formed for other uses, now blackened with smoke, and the polished floors strewed with fragments of pottery and culinary vessels.

Nor is this the worst affliction of the traveller at Dendera. He sees there other ruins, more lamentable than the encroachments of the desert and the burial in the sand, worse than the building and ruin of successive Arab villages; he sees wanton destruction by the barbarous hand of man. The beautiful columns, upon which the skilful and industrious Egyptian artist had laboured with his chisel for months, and perhaps for years, which were then looked upon with religious reverence, and ever since with admiration, have been

dashed into a thousand pieces, to build bridges and forts for the great modern reformer.

It is strange how the organ of mischief develops itself when it has something to work upon. I sat down upon the sculptured fragments of a column, which perhaps at this moment forms the abutment of some bridge, and, looking at the wreck around me, even while admiring and almost reverencing the noble ruin, began breaking off the beautifully chiselled figure of a hawk, and perhaps in ten minutes had demolished the work of a year. I felt that I was doing wrong, but excused myself by the plea that I was destroying to preserve, and saving that precious fragment from the ruin to which it was doomed, to show at home as a specimen of the skill of the Old World. So far I did well enough; but I went farther. I was looking intently, though almost unconsciously, at a pigeon on the head of Isis, the capital of one of the front columns of the temple. It was a beautiful shot; it could not have been finer if the temple had been built expressly to shoot pigeons from. I fired: the shot went smack into the beautifully sculptured face of the goddess, and put one of her eyes; the pigeon fell at the foot of the column, and while the goddess seemed to weep over her fallen state, and to reproach me for this renewed insult to herself and to the arts, I picked up the bird and returned to my boat.

On board I had constantly a fund of amusement in the movements of my Arab crew. During the Ramadan, a period of thirty days, no good Mussulman eats, drinks, or smokes, from the rising to the setting of the sun. My men religiously observed this severe requisition of the Koran, although sometimes they were at work at the oar under a burning sun nearly all day. They could form a pretty shrewd conjecture as to the time of the setting of the sun, but nevertheless they fell into the habit of regulating themselves by my watch, and I did not think the Prophet would be particularly hard upon them if I sometimes brought the day to a close half an hour or so before its time. Sometimes I was rather too liberal; but out of respect for me they considered the sun set when I told them it was; and it was interesting to see them regularly every evening, one after another, mount the upper deck, and, spreading out their cloaks, with their faces towards the tomb of the Prophet, kneel down and pray.

On the 20th, the wind was light but favourable, and part of the time the men were on shore towing with the cords. We were now approaching the most interesting spot on the Nile, perhaps in the world. Thebes, immortal Thebes, was before us, and a few hours more would place us among her ruins. Towards noon the wind died away, and left us again to the slow movement of the tow line. This was too slow for my then excited humour. I could not bear that the sun should again set before I stood among the ruins of the mighty city; and landing on the right side of the river, I set out to walk. About an hour before dark the lofty columns of the great temple at Luxor, and the still greater of Carnae, were visible. The glowing descriptions of travellers had to a certain extent inflamed my imagination. Denon, in his account of the expedition to Egypt, says, that when the French soldiers first came in sight of Thebes, the whole army involuntarily threw down their arms and stood in silent admiration—a sublime idea, whether true or not; but I am inclined to think that the French soldiers would have thrown down their arms, and clapped their hands with much greater satisfaction, if they had seen a living city and prospect of good quarters. For my own part, without at this moment referring to particulars, I was disappointed in the first view of the ruins of Thebes. We walked on the right side of the river, the valley, as usual, running back to the desert.

It was nearly dark when we arrived at the ruined village, which now occupies part of the site of the once magnificent city. The plough has been driven over the ruins of the temples, and grass was growing where palaces had stood. A single boat was lying along the

bank—a single flag, the red cross of England, was drooping lazily against the mast; and though it be death to my reputation as a sentimental traveller, at that moment I hailed the sight of that flag with more interest than the ruined city. Since I left Cairo I had seen nothing but Arabs; for three weeks I had not opened my lips except to Paul; and let me tell the reader, that though a man may take a certain degree of pleasure in travelling in strange and out-of-the-way places, he cannot forget the world he has left behind him. In a land of comparative savages, he hails the citizen of any civilised country as his brother; and when on the bank of the river I was accosted in my native tongue by a strapping fellow in a Turkish dress, though in the broken accents of a Sicilian servant, I thought it the purest English I had ever heard. I went on board the boat, and found two gentlemen, of whom I had heard at Cairo, who had been to Mount Sinai, from thence to Hor, by the Red Sea to Cosseir, and thence across the desert to Thebes, where they had only arrived that day. I sat with them till a late hour. I cannot flatter myself that the evening passed as agreeably to them as to me, for they had been a party of six, and I alone; but I saw them afterwards, and our acquaintance ripened into intimacy; and though our lots are cast in different places, and we shall probably never meet again, if I do not deceive myself, neither will ever forget the acquaintance formed that night on the banks of the Nile.

Our conversation during the evening was desultory and various. We mounted the pyramids, sat down among the ruins of temples, groped among tombs, and, mixed up with these higher matters, touched incidentally upon rats, fleas, and all kinds of vermin. I say we touched incidentally upon these things; but, to tell the truth, we talked so much about them, that when I went to my boat, I fairly crawled. I have omitted to mention that the curse provoked by Pharaoh still rests upon the land, and that rats, fleas, and all those detestable animals into which Aaron converted the sands, are still the portion of the traveller and sojourner in Egypt. I had suffered considerably during the last four days, but not willing to lose a favourable wind, had put off resorting to the usual means of relief. To-night, however, there was no enduring it any longer; the rats ran, shrieked, and shouted, as if celebrating a jubilee on account of some great mortality among the cats, and the lesser animals came upon me as if the rod of Aaron had been lifted for my special affliction. I got up during the night, and told Paul that we would remain here a day, and early in the morning they must sink the boat. Before I woke, we were half across the river, being obliged to cross in order to find a convenient place for sinking. I was vexed at having left so abruptly my new companions; but it was too late to return. We pitched our tent on the bank, and immediately commenced unloading the boat.

On a point a little above, in front of a large house built by the French, at the south end of the temple of Luxor, and one of the most beautiful positions on the Nile, were two tents. I knew that they belonged to the companions of the two gentlemen on the opposite side, and that there was a lady with them. I rather put myself out of the way for it, and the first time I met the three gentlemen on the bank, I was not particularly pleased with them. I may have deceived myself, but I thought they did not greet me as cordially as I was disposed to greet every traveller I met in that remote country. True, I was not a very inviting-looking object; but, as I said to myself, "Take the beam out of your own eye, and then—" True, too, their beards were longer, and one of them was redder than mine, but I did not think that gave them any right to put on airs. In short, I left them with a sort of go-to-the-devil feeling, and did not expect to have any more to do with them. I therefore strolled away, and spent the day rambling among the ruins of the temples of Luxor and Carnae. I shall not now attempt any de-

scription of these temples, nor of the ruins of Thebes generally (no easy task), but reserve the whole until my return from the Cataracts.

At about three o'clock I returned to my tent. It was the first day of the feast of Bairam, the thirty days of fasting (Ramadan) being just ended. It was a great day at Luxor; the bazaars were supplied with country products, the little cafeterias were filled with smokers, indemnifying themselves for their long abstinence, and the Fellahs were coming in from the country. On my return from Carnac, I for the first time saw dromedaries, richly caparisoned, mounted by well-armed Arabs, and dashing over the ground at full gallop. I had never seen dromedaries before, except in caravans, accommodating themselves to the slow pace of the camel, and I did not think the clumsy, lumbering animal, could carry himself so proudly, and move so rapidly. Their movement, however, was very far from realising the extravagant expression of "swift as the wind," applied to it in the East. I was somewhat fatigued on my return, and Paul met me on the bank with a smiling face, and information that the English party had sent their janizary to ask me to dine with them at six o'clock. Few things tend to give you a better opinion of a man, of his intelligence, his piety, and morals, than receiving from him an invitation to dinner. I am what is called a sure man in such cases, and the reader may suppose that I was not wanting upon this occasion.

It was an excessively hot day. You who were hovering over your coal fires, or moving about wrapped in cloaks or greatcoats, can hardly believe that on the 20th of January the Arabs were refreshing their heated bodies by a bath in the Nile, and that I was lying under my tent actually panting for breath. I had plenty to occupy me, but the heat was too intense; the sun seemed to search the brain, while the sands blistered the feet. I think it was the hottest day I experienced on the Nile.

While leaning on my elbow, looking out of the door of my tent towards the temple of Luxor, I saw a large body of Arabs, on foot, on dromedaries, and on horseback, coming down towards the river. They came about half way across the sandy plain between the temple and the river, and stopped nearly opposite to my tent, so as to give me a full view of all their movements. The slaves and pipe-bearers immediately spread mats on the sand, on which the principal persons seated themselves, and, while they were taking coffee and pipes, others were making preparations for equestrian exercises. The forms and ceremonies presented to my mind a lively picture of preparing the lists for a tournament; and the intense heat and scorching sands reminded me of the great passage of arms in Scott's Crusaders, near the Diamond of the Desert, on the shores of the Dead Sea.

The parties were on horseback, holding in their right hands long wooden spears, the lower ends resting on the sand, close together, and forming a pivot around which their movements were made. They rode round in a circle, with their spears in the sand, and their eyes keenly fixed on each other, watching an opportunity to strike; chased, turned, and doubled, but never leaving the pivot; occasionally the spears were raised, crossed, and struck together, and a murmuring ran through the crowd like the cry in the fencing-scene in Hamlet, "a hit, a fair hit!" and the parties separated, or again dropped their poles in the centre for another round. The play for some time seemed confined to slaves and dependents, and among them, and decidedly the most skilful, was a young Nubian. His master, a Turk, who was sitting on the mat, seemed particularly pleased with his success.

The whole of this seemed merely a preliminary designed to stir up the dormant spirit of the masters. For a long time they sat quietly puffing their pipes, and probably longing for the stimulus of a battle-cry to rouse them from their torpor. At length one of them, the master of the Nubian, slowly rose from the mat, and challenged an antagonist. Slowly he laid down his pipe, and took and raised the pole in his

hand; but still he was not more than half roused. A fresh horse was brought him, and, without taking off his heavy cloth mantle, he drowsily placed his left foot in the broad shovel stirrup, his right on the rump of the horse, behind the saddle, and swung himself into the seat. The first touch of the saddle seemed to rouse him; he took the pole from the hand of his attendant, gave his horse a severe check, and, driving the heavy corners of the stirrups into his sides, dashed through the sand on a full run. At the other end of the course he stopped, rested a moment or two, then again driving his irons into his horse, dashed back at full speed; and when it seemed as if his next step would carry him headlong among the Turks on the mat, with one jerk he threw his horse back on his haunches, and brought him up from a full run to a dead stop. This seemed to warm him a little; his attendant came up and took off his cloak, under which he had a red silk jacket and white trousers, and again he dashed through the sand and back as before. This time he brought up his horse with furious vehemence; his turban became unrolled, he flew into a violent passion, tore it off and threw it on the sand, and, leaving his play, fiercely struck the spear of his adversary, and the battle at once commenced. The Turk, who had seemed too indolent to move, now showed a fire and energy, and an endurance of fatigue, that would have been terrible in battle. Both horse and rider scorned the blazing sun and burning sands, and round and round they ran, chasing, turning, and doubling within an incredibly small circle, till an approving murmur was heard among the crowd. The trial was now over, and the excited Turk again seated himself upon the mat, and relapsed into a state of calm indifference.

The exercise finished just in time to enable me to make my toilet for dinner. As there was a lady in the case, I had some doubt whether I ought not to shave, not having performed that operation since I left Cairo; but as I had already seen the gentlemen of the party, and had fallen, moreover, into the fashion of the country, of shaving the head and wearing the tarbouch (one of the greatest luxuries in Egypt, by the way), and could not in any event sit with my head uncovered, I determined to stick to the beard; and disguising myself in a clean shirt, and giving directions to my boatmen to be ready to start at ten o'clock, I walked along the bank to the tent of my new friends. I do not know whether my notion in the morning was right, or whether I had misapprehended things; but at any rate, I had no reason to complain of my reception now; I think myself that there was a difference, which I accounted for in my own way, by ascribing to their discovery that I was an American. I have observed that English meeting abroad, though they would probably stand by each other to the death in a quarrel, are ridiculously shy of each other as acquaintances, on account of the great difference of caste at home. As regards Americans, the case is different, and to them the English display none of that feeling. After I had started on my ramble, Paul had planted my flag at the door of the tent, and, among the other advantages which that flag brought me, I included my invitation to dinner, agreeable acquaintances, and one of the most pleasant evenings I spent on the Nile. Indeed, I hope I may be pardoned a burst of national feeling, and be allowed to say, without meaning any disrespect to any other country, that I would rather travel under the name of an American than under any other known in Europe. Every American abroad meets a general prepossession in favour of his country, and it is an agreeable truth that the impression made by our countrymen abroad generally sustains the prepossession. I have met with some, however, who destroyed this good effect, and made themselves disagreeable and gave offence by a habit of intruding their country, and its institutions, and of drawing invidious comparisons, with a pertinacity and self-complacency I never saw in any other people.

But to return to the dinner: a man may make a long

## CHAPTER VIII.

digression before a dinner on paper, who would scorn such a thing before a dinner *de facto*. The party consisted of four—a gentleman and his lady, he an honourable, and heir to an old and respectable title; a brother of the lady, an ex-captain in the guards, who changed his name and resigned his commission on receiving a fortune from an uncle; and another gentleman, I do not know whether of that family, but bearing one of the proudest names in England. They were all young, the oldest not more than thirty-five, and not excepting the lady, full of thirst for adventure and travel. I say not excepting the lady; I should rather say that the lady was the life and soul of the party. She was young and beautiful, in the most attractive style of English beauty; she was married, and therefore dead in law; and as we may say what we will of the dead, I venture to say that she had shone as a beauty and a belle in the proudest circles of England, and was now enjoying more pleasure than Almack's or drawing-rooms could give, rambling among ruins, and sleeping under a tent on the banks of the Nile. They had travelled in Spain, had just come from Mount Sinai and the Red Sea, and talked of Bagdad. I had often met on the continent with Englishmen who "were out" as they called it, for a certain time, one year or two years, but this party had no fixed time; they "were out" for as long as suited their humour. To them I am indebted for the most interesting part of my journey in the East, for they first suggested to me the route by Petra and Arabia Petrea. We made a calculation by which we hoped, in reference to what each had to do, to meet at Cairo and make the attempt together. It was a great exertion of resolution that I did not abandon my own plans, and keep in company with them, but they had too much time for me; a month or two was no object to them, but to me a very great one.

All this, and much more, including the expression of a determination, when they had finished their travels in the Old World, to visit us in the New, took place while we were dining under the tent of the captain and his friend. The table stood in the middle on canteens, about eight inches from the ground, with a mattress on each side for seats. It was rather awkward sitting, particularly for me, who was next the lady, and in that position felt some of the trammels of conventional life; there was no room to put my legs under the table, and, not anticipating the precise state of things, I had not arranged straps and suspenders, and my feet seemed to be bigger than ever. I doubled them under me; they got asleep, not the quiet and tranquil sleep which makes you forget existence, but the slumber of a troubled conscience, pricking and burning, till human nature could endure it no longer, and I kicked out the offending members with very little regard to elegance of attitude. The ice once broken, I felt at my ease, and the evening wore away too soon. An embargo had been laid upon my tongue so long, that my ears fairly tingled with pleasure at hearing myself talk. It was, in fact, a glorious evening; a bright spot that I love to look back upon, more than indemnifying me for weeks of loneliness. I sat with them till a late hour; and when I parted, I did not feel as if it were the first time I had seen them, or think it would be the last, expecting to meet them a few days afterwards at the Cataracts. But I never saw them again; we passed each other on the river during the night. I received several messages from them; and at Beyroot, after I had finished my tour in Arabia Petrea and the Holy Land, I received a letter from them, still on the Nile. I should be extremely sorry to think that we are never to meet again, and hope that, when wearied with rambling among the ruins of the Old World, they will execute their purpose of visiting America, and that here we may talk over our meeting on the banks of the Nile. I went back to my boat to greater loneliness than before, but there was a fine wind, and in a few minutes we were again under way. I sat on deck till a late hour, smoked two or three pipes, and retired to my little cabin.

The Rock of the Chain.—Ravages of the Plague.—Deserted Quarries.—A youthful Navigator.—A recollection of Sam Patch.—Ancient Inscriptions.—A perplexed Major-domo.—A Dinner without Parallel.—An awkward Discovery.

THE next day and the next still brought us favourable winds and strong, and we were obliged to take down one of our tall lattes, but made great progress with the other, even against the rapid current of the river. The Nile was very wide, the water turbulent, and the waves rolling with such violence that Paul became seasick; and if it had not been for the distant banks, we could hardly have believed ourselves on the bosom of a river 1000 miles from the ocean.

In the evening we were approaching Hadjar Silsily, the Rock of the Chain, the narrowest part of the river, where the mountains of Africa and Arabia seem marching to meet each other, and stopping merely to leave a narrow passage for the river. Tradition says that in ancient days an iron chain was drawn across the narrow strait, which checked the current; and the Arab boatman believes he can still see, in the sides of the mountains, the marks of the rings and bolts to which the miraculous chain was fastened.

We hauled up alongside of the bank for part of the night, and the next morning, with a strong and favourable wind, were approaching Assouan, the last town in Egypt, standing on the borders of Ethiopia, and at the foot of the Cataracts of the Nile. For some time before reaching Assouan, the river becomes broader and the mountains again retire, leaving space for the islands, and a broad surface for the body of the river. About three miles this side, on the Arabian bank, is the new palace of Ibrahim, where he retired and shut himself up during the terrible plague of last year. On the right, the top of the Libyan mountain is crowned with the tomb of a Marabout Sheik, and about half way down are the ruins of a convent, picturesque and interesting, as telling that before the Crescent came and trampled it under foot, the Cross, the symbol of the Christian faith, once reared its sacred form in the interior of Africa. In front is the beautiful Island of Elephantina, with a green bank sloping down to the river. On the left are rugged mountains; and projecting in rude and giant masses into the river are the rocks of dark grey granite, from which came the mighty obelisks and monuments that adorned the ancient temples of Egypt. The little town of Assouan stands on the bank of the river, almost hid among palm-trees; and back at a distance on the height are the ruins of the old city.

From the deck of my boat, the approach to the Cataracts presented by far the finest scene on the Nile, possessing a variety and wildness equally striking and beautiful, after the monotonous scenery along the whole ascent of the river. With streamers gallantly flying, I entered the little harbour, and with a feeling of satisfaction that amply repaid me for all its vexations, I looked upon the end of my journey. I would have gone to the second cataract if time had been no object to me, or if I had had at that time any idea of writing a book, as the second cataract is the usual terminus for travellers on the Nile; and a man who returns to Cairo without having been there, is not considered entitled to talk much about his voyage up the river.

I am, perhaps, publishing my own want of taste when I say that the notion of going to the great Oasis had taken such a hold of me, that it was mainly for this object that I sacrificed the voyage to the second cataract. With the feeling, therefore, that here was the end of my journey in this direction, I jumped upon the bank; and, having been pent up on board for two days, I put myself in rapid action, and, in one of the cant phrases of continental tourists, began to "knock down the lions."

My first move was to the little town of Assouan; but here I found little to detain me. It was better built than most of the towns on the Nile, and has its street of bazaars; the slave-bazaars being by far the best

supplied of any. In one of the little caferias opposite the slave-market, a Turk meanly dressed, though with arms, and a mouthpiece to his pipe that marked him as a man of rank, attracted my particular attention. He was almost the last of the Mamelukes, but yesterday the lords of Egypt; one of the few who escaped the general massacre of his race, and one of the very few permitted to drag out the remnant of their days in the pacha's dominions.

The ruins of the old town are in a singularly high, bold, and commanding situation, overlooking the river, the Cataracts, the island of Elephantina, and the Arabian desert. More than 1000 years ago this city contained a large and flourishing population; and some idea may be formed of its former greatness, from the fact that more than 20,000 of its inhabitants died in one year of the plague. In consequence of the terrible ravages of this scourge, the inhabitants abandoned it; but, still clinging to their ancient homes, commenced building a new town, beginning at the northern wall of the old. The valley here is very narrow; and the desert of Arabia, with its front of dark granite mountains, advances to its bank.

The southern gate of the modern town opens to the sands of the desert, and immediately outside the walls is a large Mahomedan burying-ground, by its extent and the number of its tombstones exciting the wonder of the stranger how so small a town could pay such a tribute to the king of terrors. In many places the bodies were not more than half buried, the loose sand which had been sprinkled over them having been blown away. Skulls, legs, and arms, were scattered about in every direction; and in one place we saw a pile of skulls and bones, which seemed to have been collected by some pious hand, to save them from the foot of the passing traveller. In another, the rest of the body still buried, the feet were sticking out, and the naked skull, staring at us from its sightless sockets, seemed struggling to free itself from the bondage of the grave, and claiming the promise of a resurrection from the dead. We buried again these relics of mortality, and hoping it might not be our lot to lay our bones where the grave was so little revered, continued our way to the ancient granite quarries of Syene.

These quarries stand about half an hour's walk from the river, in the bosom of a long range of granite mountains, stretching off into the desert of Arabia. Time and exposure have not touched the freshness of the stone, and the whole of the immense quarry looks as if it were but yesterday that the Egyptian left it. You could imagine that the workman had just gone to his noonday meal; and as you look at the mighty obelisk lying rude and unfinished at your feet, you feel disposed to linger till the Egyptian shall come to resume his work, to carve his mysterious characters upon it, and make it a fit portal for some mighty temple. But the hammer and chisel will never be heard there more. The Egyptian workmen have passed away, and these immense quarries are now and for ever silent and deserted.

Aside from the great interest of these ancient quarries, it is curious to notice how, long before the forces of gunpowder and the art of blasting rocks were known, immense stones were separated from the sides of the mountains, and divided as the artist wished, by the slow process of boring small holes, and splitting them apart with wedges.

I returned by the old city, crossing its burying-ground, which, like that of the new town, told, in language that could not be misunderstood, that before the city was destroyed, it, too, had paid a large tribute to the grave. This burying-ground has an interest not possessed by any other in Egypt, as it contains, scattered over its extended surface, many tombstones with Coptic inscriptions, the only existing remains of the language of a people who style themselves, and are styled, the descendants of the ancient Egyptians.

It was late in the afternoon as I stood on the height crowned by the ruins of the ancient city, with a mo-

mentary feeling of returning loneliness, and gazed upon the sun retiring with glorious splendour towards my far-distant home. I turned my eyes to my boat, and beyond it at a distance down the river, I saw a boat coming up under full sail, bearing what my now practised eye told me was the English flag. I hurried down, and arrived in time to welcome to the Cataracts of the Nile the two gentlemen I had first met at Thebes.

We spent the evening together, and I abandoned my original intention of taking my own boat up the Cataracts, and agreed to go up with them.

In the morning, after an early breakfast, we started for the Island of Philoe, about eight miles from Assouan, and above all the Cataracts; an island singularly beautiful in situation, and containing the ruins of a magnificent temple. The road lay nearly all the way along the river, commanding a full view of the Cataracts, or rather, if a citizen of a new world may lay his innovating hand upon things consecrated by the universal consent of ages, what we who have heard the roar of Niagara, would call simply the "rapids." We set off on shaggy donkeys, without saddle, bridle, or halter. A short distance from Assouan, unmarked by any monument, amid arid sands, we crossed the line which, since the days of Pharaoh, has existed as the boundary between Egypt and Ethiopia. We passed through several villages, standing alone at the foot of the granite mountains, without green or verdure around them, even to the extent of a blade of grass, and irresistibly suggesting the question, "How do the miserable inhabitants live?" It was not the first time I had had occasion to remark the effect of blood on physical character, and the strong and marked difference of races among people living under the same sun, and almost on a common soil. In the first village in Nubia, though not half an hour from Assouan, there is a difference obvious to the most superficial observer, and here, on the very confines of Egypt, it would be impossible to mistake a border Nubian for an Arab of Assouan.

Before arriving at Philoe, the river is filled with rocks and islands, and the view becomes singularly bold and striking. At the foot of one of the islands is a sort of ferry, with a very big boat and a very little boy to manage it; we got on board, and were astonished to see with what courage and address the little fellow conducted us among the islands washed by the Cataracts. And it was not a straight ahead navigation either; he was obliged to take advantage of an eddy to get to one point, jump ashore, tow the boat to another, again drop to another, tow her again, and so on; and all this time the little fellow was at the helm, at the oar, at the rope, leading the chorus of a Nubian song, and ordering his crew, which consisted of three boys and one little girl. In this way we worked to an island inhabited by a few miserable Nubians, and, crossing it, came to the point of the principal cataract (I continue to call it cataract by courtesy), being a fall of about two feet.

And these were the great Cataracts of the Nile, whose roar in ancient days affrighted the Egyptian boatmen, and which history and poetry have invested with extraordinary and ideal terrors! The traveller who has come from a country as far distant as mine, bringing all that freshness of feeling with which a citizen of the New World turns to the storied wonders of the Old, and has roamed over the mountains and drunk of the rivers of Greece, will have found himself so often cheated by the exaggerated accounts of the ancients, the vivid descriptions of poets, and his own imagination, that he will hardly feel disappointed when he stands by this apology for a cataract.

Here the Nubian boys had a great feat to show, namely, jump into the cataract and float down to the point of the island. The inhabitants of the countries bordering on the Nile are great swimmers, and the Nubians are perhaps the best of all; but this was no great feat. The great and ever-to-be-lamented Sam Patch would have made the Nubians stare, and shown them, in his own pithy phrase, "that some folks could do things as well as other folks;" and I question if

there is a cataract on the Nile at which that daring diver would not have turned up his nose in scorn.

We returned by the same way we had come, and under the same guidance, augmented, however, by a motley collection of men and boys, who had joined us as our escort. In paying for the boat we showed a preference for our little boy, which brought down upon him all the rest, and he had to run to us for protection. We saved him for the present, but left him exposed to one of the evils attendant upon the acquisition of money all the world over, the difficulty of keeping it, which difficulty, in his case, was so great physically, that I have no doubt he was stripped of more than half before we were out of sight.

Getting rid of them, or as many of them as we could, we again mounted our shaggy donkeys, and rode to the Island of Philæ. This island makes one of the most beautiful pictures I ever saw. Perhaps the general monotony of the scenery on the Nile gives it a peculiar beauty; but I think it would be called beautiful any where, even among the finest scenes in Italy. It brought forcibly to my mind, but seemed to me far more lovely than, the Lake Maggiore, with the beautiful Isola Bella and Isola Madre. It is entirely unique, a beautiful *lusus nature*, a little island about 1000 feet long and 400 broad, rising in the centre of a circular bay, which appears to be cut off from the river, and forms a lake surrounded by dark sandstone rocks, carpeted with green to the water's edge, and covered with columns, propylons, and towers, the ruins of a majestic temple. A sunken wall encircles it on all sides, on which, in a few moments, we landed.

I have avoided description of ruins when I could. The fact is, I know nothing of architecture, and never measured anything in my life; before I came to Egypt I could not tell the difference between a dromos and a propylon, and my whole knowledge of Egyptian antiquities was little more than enough to enable me to distinguish between a mummy and a pyramid. I picked up about enough on the spot to answer my purpose; but I have too much charity for my reader to impose my smattering on him. In fact, I have already forgotten more than half of the little that I then learned, and I should show but a poor return for his kindness if I were to puzzle him with the use or misuse of technical phrases. Still I must do something; the temples of Egypt must have a place here; for I might as well leave out Jerusalem in the story of a tour through the Holy Land.

The temple of Philæ is a magnificent ruin, 435 feet in length, and 105 in width. It stands at the south-west corner of the island, close upon the bank of the river, and the approach to it is by a grand colonnade, extending 240 feet along the edge of the river to the grand propylon. The propylon is nearly 100 feet long, and rises on each side of the gateway in two lofty towers, in the form of a truncated pyramid. The front is decorated with sculpture and hieroglyphics; on each side a figure of Isis, twenty feet high, with the moon over her head, and near the front formerly stood two obelisks and two sphinxes, the pedestals and ruins of which still remain. The body of the temple contains eleven chambers, covered with sculpture and hieroglyphics, the figures tinted in the most lively colours, and the ceiling painted azure, and studded with stars.

But there are other things which touch the beholder more nearly than the majestic ruins of the temple—things which carry him from the works of man to a grander and higher subject, that of man himself. On the lofty towers in front of the temple, among the mysterious and unknown writings of the Egyptians, were inscriptions in Greek and Latin, telling that they whose names were there written had come to worship the great goddess Isis; that men had lived and looked upon the sun, moon, and stars, the mountains and the rolling river, and worshipped a mute idol. And again, on the front wall was the sacred cross, the emblem of the Christian faith, and the figures of the Egyptian deities were defaced and plastered over, showing that

another race had been there to worship, who scorned and trampled on the gods of the heathen. And again there was an inscription of later days, that in the ruins of the temple carried with it a wild and fearful interest; telling that the thunder of modern war had been heard above the roar of the cataract, and that the arm of the soldier which had struck terror in the frozen regions of the north, had swept the burning sands of Africa. In the grand propylon, among the names of tourists and travellers, in a small plain hand, is written—"L'an 6 de la république, le 13 Messidor, une armée Française, commandée par Buonaparte, est descendue à Alexandrie; l'armée ayant mis, vingt jours après, les Mamelukes en fuite aux pyramides, Dessaix, commandant la première division, les poursuivit, au delà des cataractes, où il est arrivé le 13 Ventose, de l'an 7." Near this was an inscription that to me was far more interesting than all the rest, the name of an early friend, "C—B—, U. S. of America," written with his own hand. I did not know that he had been here, although I knew he had been many years from home, and I had read in a newspaper that he had died in Palestine. A thousand recollections crowded upon me, of joys departed never to return, and made me sad. I wrote my name under his, and left the temple.

I was glad to get back to my rascally donkey. If a man were oppressed and borne down with mental anxiety, if he were mourning and melancholy, either from the loss of a friend or an undigested dinner, I would engage to cure him. I would put him on a donkey without saddle or halter, and if he did not find himself by degrees drawn from the sense of his misery, and worked up into a towering passion, getting off and belabouring his brute with his stick, and forgetting every thing in this world but the obstinacy of the ass, and his own folly in attempting to ride one, man is a more quiet animal than I take him to be.

As I intended going the next day up the Cataracts with my companions, and expected to spend the day on board their boat, I had asked them to dine with me in the evening. After giving the invitation, I held a council with Paul, who told me that the thing was impossible, and, with a prudence worthy of Caleb Balderstone, expressed his wonder that I had not worked an invitation out of them. I told him, however, that the thing was settled, and dine with me they must. My house-keeping had never been very extravagant, and macaroni, rice, and fowl, had been my standing dishes. Paul was pertinacious in raising objections, but I told him peremptorily there was no escape; that he must buy a cow or a camel, if necessary, and left him scratching his head and pondering over the task before him.

In the hurried business of the day, I had entirely forgotten Paul and his perplexities. Once only, I remember, with a commendable prudence, I tried to get my companions to expend some of their force upon dried dates and Nubian bread, which they as maliciously declined, that they might do justice to me. Returning now, at the end of nine hours' hard work, crossing rivers and rambling among ruins, the sharp exercise, and the grating of my teeth at the stubborn movements of my donkey, gave me an extraordinary voracity, and dinner—the all-important, never-to-be-forgotten business of the day, the delight alike of the ploughman and philosopher—dinner with its uncertain goodness, began to press upon the most tender sensibilities of my nature. My companions felt the vibrations of the same chord, and, with an unnecessary degree of circumstance, talked of the effect of air and exercise in sharpening the appetite, and the glorious satisfaction, after a day's work, of sitting down to a good dinner. I had perfect confidence in Paul's zeal and ability, but I began to have some misgivings. I felt a hungry devil within me, that roared as if he would never be satisfied. I looked at my companions, and heard them talk; and as I followed their humour with an hysterical laugh, I thought the genius of famine was at my heels in the shape of two hungry Englishmen. I trembled for Paul, but the first glimpse

I caught of him reassured me. He sat on the deck of the boat, with his arms folded, coolly, though with an air of conscious importance, looking out for us. Slowly and with dignity he came to assist us from our cursed donkeys; neither a smile nor frown was on his face, but there reigned an expression that you could not mistake. Reader, you have seen the countenance of a good man lighted up with the consciousness of having done a good action; even so was Paul's. I could read in his face a consciousness of having acted well his part. One might almost have dined on it. It said, as plainly as face could speak, one, two, three, four, five courses and a dessert, or, as they say at the two-franc restaurants in Paris, "Quatre plats, une demi bouteille de vin, et pain à discrétion."

In fact, the worthy butler of Ravenswood could not have stood in the hall of his master in the days of its glory, before thunder broke china and soured butter-milk, with more sober and conscious dignity than did Paul stand on the deck of my boat to receive us. A load was removed from my heart. I knew that my credit was saved, and I led the way with a proud step to my little cabin. Still I asked no questions, and made no apologies. I simply told my companions we were in Paul's hands, and he would do with us as seemed to him good. Another board had been added to my table, and my towel had been washed and dried during the day, and now lay, clean and of a rather reddish white, doing the duty of a table-cloth. I noticed, too, tumblers, knives and forks, and plates, which were strangers to me, but I said nothing; we seated ourselves and waited, nor did we wait long; soon we saw Paul coming towards us, staggering under the weight of his burden, the savoury odour of which preceded him. He entered, and laid before us an Irish stew. Reader, did you ever eat an Irish stew? Gracious Heaven! I shall never forget that paragon of dishes; how often in the Desert, among the mountains of Sinai, in the Holy Land, rambling along the Valley of Jehoshaphat, or on the shores of the Dead Sea—how often has that Irish stew risen before me to tease and tantalise me, and haunt me with the memory of departed joys! The potato is a vegetable that does not grow in Egypt. I had not tasted one for more than a month, and was almost startled out of my propriety at seeing them; but I held my peace, and was as solemn and dignified as Paul himself. Without much ceremony, we threw ourselves with one accord upon the stew. I think I only do our party justice, when I say that few of those famished gentlemen, from whose emerald isle it takes its name, could have shown more affection for the national dish. For my own part, as I did not know what was coming next, if any thing, I felt loath to part with it. My companions were knowing ones, and seemed to be of the same way of thinking, and, without any consultation, all appeared to be approaching the same end, to wit, the end of the stew. With the empty dish before him, demonstrative to Paul that so far we were perfectly satisfied with what he had done, that worthy purveyor came forward with an increase of dignity to change our plates. I now saw that something more was coming. I had suspected from the beginning that Paul was in the mutton line, and involuntarily murmured, "This day a sheep has died;" and presently on came another cut of the murdered innocent, in cutlets, accompanied by fried potatoes. Then came boiled mutton and boiled potatoes, and then roast mutton and roast potatoes, and then came a macaroni paté. I thought this was going to spoil the whole; until this I had considered the dinner as something extraordinary and recherché. But the macaroni, the thing of at least six days in the week, utterly disconcerted me. I tried to give Paul a wink to keep it back, but on he came; if he had followed with a chicken, I verily believe I should have thrown it at his head. But my friends were unflinching and uncompromising. They were determined to stand by Paul to the last; and we laid in the macaroni paté with as much vigour as if we had not already eaten a sheep. Paul wound us up and packed us down with pancakes. I never knew a

man that did not like pancakes, or who could not eat them even at the end of a mighty dinner. And now, feeling that happy sensation of fulness which puts a man above kings, princes, or pachas, we lighted our long pipes and smoked. Our stomachs were full, and our hearts were open. Talk of mutual sympathy, of congenial spirits, of similarity of tastes, and all that; 'tis the dinner which unlocks the heart; you feel yourself warming towards the man that has dined with you. It was in this happy spirit that we lay like warriors, resting on our arms, and talked over the particulars of our battles.

And now, all dignity put aside and all restraint removed, and thinking my friends might have recognised acquaintances among the things at the table which were strangers to me, and thinking, too, that I stood on a pinnacle, and, come what might, I could not fall, I led the way in speculating upon the manner in which Paul had served us. The ice once broken, my friends solved many of the mysteries, by claiming this, that, and the other, as part of their furniture and stores. In fact, they were going on most unscrupulously, making it somewhat doubtful whether I had furnished any thing for my own dinner, and I called in Paul. But that functionary had no desire to be questioned; he hemmed, and hawed, and dodged about; but I told him to make a clean heart of it, and then it came out, but it was like drawing teeth, that he had been on a regular foraging expedition among their stores. The potatoes with which he had made such a flourish were part of a very small stock furnished them by a friend, as a luxury not to be had on the Nile; and, instead of the acknowledgments which I expected to receive on account of my dinner, my friends congratulated me rather ironically upon possessing such a treasure of a steward. We sat together till a late hour; were grave, gay, laughing, and lachrymose, by turns; and when we began to doze over our pipes, betook ourselves to slumber.

## CHAPTER IX.

Ascent of the Cataracts.—A Nautical Patriarch.—Political Improvement.—A Nubian Damsel's Wardrobe.—A Test of Friendship.—East and West.—Moonlight on the Nile.—Uses of a Temple.

IN the morning we were up betimes, expecting another stirring day in mounting the Cataracts. Carrying boats up and down the rapids is the great business of the Nubians who live on the borders of Egypt. It is a business that requires great knowledge and address; and the rais who commands the large squad of men necessary to mount a boat, is an important person among them. He was already there with part of his men, the others being stationed among the islands of the Cataracts, at the places where their services would be needed. This rais was one of the most noble-looking men I ever saw. He was more than eighty, a native of Barbary, who had in early life wandered with a caravan across the Libyan Desert, and been left, he knew not why, on a little island among the Cataracts of the Nile. As the Nubian does now, firmly seated on a log and paddling with his hands, he had floated in every eddy, and marked every stone that the falling river lays bare to the eye; and now, with the experience of years, he stood among the Nubians, confessedly one of their most skilful pilots through a difficult and sometimes dangerous navigation. He was tall and thin, with a beard of uncommon length and whiteness; a face dried, scarred, and wrinkled, and dark as it could be without having the blackness of a negro. His costume was a clean white turban, red jacket, and red sash, with white trousers, red slippers, and a heavy club fastened by a string around his wrist. I am particular in describing the appearance of the hardy old man, for we were exceedingly struck with it. Nothing could be finer than his look, his walk, his every movement; and the picturesque effect was admirably heightened by contrast with his swarthy assistants, most of whom were despe-

rately ragged, and many of them as naked as they were born. The old man came on board with a dignity that savoured more of a youth passed amid the polish of a European court, than on the sands of Barbary, or the rude islands of the Nile. We received him as if he had been the great pacha himself, gave him coffee and pipes, and left him to the greatest luxury of the East, perfect rest, until his services should be required.

In the meantime, with a strong and favourable wind, we started from the little harbour of Assouan, while a throng of idlers, gathered together on the beach, watched our departure with as much interest as though it were not an event of almost daily occurrence. Almost immediately above Assouan the view extends over a broad surface, and the rocks and islands begin to multiply. The strong wind enabled us to ascend some distance with the sails; but our progress gradually diminished, and at length, while our sails were yet filled almost to bursting, we came to a dead stand, struggled vainly for a while against the increasing current, and then fell astern. The old rais, who had sat quietly watching the movements of the boat, now roused himself; and at his command, a naked Nubian, with a rope over his shoulders, plunged into the river and swam for the shore. At first he swam boldly and vigorously; but soon his strength began to fail, and the weight of the slackened rope effectually stopped his progress; when, resting for a little space, he dived like a duck, kicking his heels in the air, came up clear of the rope, and soon gained the bank. A dozen Nubians now threw themselves into the water, caught the sinking rope, carried it ashore, and wound it round a rock. Again the rais spoke, and fifty swarthy bodies were splashing in the water, and in a moment more they were on the rocky bank, hauling upon the rope; others joined them, but where they came from nobody could see; and by the strength of a hundred men, all pulling and shouting together, and both sails full, we passed the first Cataract.

Above this the passage became more difficult, and the old rais seemed to rise in spirit and energy with the emergency. As we approached the second Cataract, half a dozen ropes were thrown out, and the men seemed to multiply as if by magic, springing up among the rocks like a parcel of black river-gods. More than two hundred of them were hauling on the ropes at once, climbing over the rocks, descending into the river, and again mounting, with their naked bodies shining in the sun, all talking, tugging, ordering, and shouting together; and among them, high above the rest, was heard the clear voice of the rais. His noble figure, too, was seen, now scrambling along the base of a rock, now standing on its summit, his long arms thrown above his head, his white beard and ample dress streaming in the wind, until the inert mass had triumphed over the rushing river; when he again took his seat upon the deck, and in the luxury of his pipe forgot the animating scene that for a moment had cheated him back to youth.

At this season there was in no place a fall of more than two feet; though the river, breaking among the almost innumerable rocks and islands, hurried along with great violence and rapidity. In the midst of the most furious rushing of the waters, adding much to the striking wildness of the scene, were two figures, with their clothes tied above their heads, sitting upon the surface of the water apparently, and floating as if by a miracle. They were a man and his wife, crossing from one of the islands; their bark a log, with a bundle of corstalks on each side; too frail to support their weight, yet strong enough to keep them from sinking.

And now all was over; we had passed the Cataracts, catching our dinner at intervals as we came up. We had wound round the beautiful Island of Philœ, and the boat had hauled up alongside the bank to let me go ashore. The moment of parting and returning to my former loneliness had come, and I felt my courage failing. I verily believe that if my own boat had been above the Cataracts, I should have given up my own project and accompanied my English friends. Paul

was even more reluctant to part than his master. He had never travelled except with a party, where the other servants and dragomen were company for him, and after these chance encounters he was for a while completely prostrated. The moment of parting came and passed; warm adieus were exchanged, and, with Paul and my own rais for company, I set out on foot for Assouan.

Directly opposite the Island of Philœ is a stopping-place for boats, where dates, the great produce of Upper Egypt, are brought in large quantities, and deposited preparatory to being sent down to Cairo. All along the upper part of the Nile the palm-tree had become more plentiful, and here it was the principal and almost only product of the country. Its value is inestimable to the Nubians, as well as to the Arabs of Upper Egypt; and so well is this value known, and so general is the progress of the country in European improvements, that every tree pays an annual tax to the great reformer.

The Nubian is interesting in his appearance and character; his figure is tall, thin, sinewy, and graceful, possessing what would be called in civilised life an uncommon degree of gentility; his face is rather dark, though far removed from African blackness; his features are long and aquiline, decidedly resembling the Roman; the expression of his face mild, amiable, and approaching to melancholy. I remember to have thought, when reading Sir Walter Scott's *Crusaders*, that the metamorphosis of Kenneth into a Nubian was strained and improbable, as I did not then understand the shades of difference in the features and complexion of the inhabitants of Africa; but observation has shown me that it was my own ignorance that deceived me; and in this, as in other descriptions of Eastern scenes, I have been forced to admire the great and intimate knowledge of details possessed by the unequalled novelist, and his truth and liveliness of description.

The inhabitants of Nubia, like all who come under the rod of the pacha, suffer the accumulated ills of poverty. Happily, they live in a country where their wants are few; the sun warms them, and the palm-tree feeds and clothes them. The use of fire-arms is almost unknown, and their weapons are still the spear and shield, as in ages long past. In the upper part of Nubia the men and women go entirely naked, except a piece of leather about six inches wide, cut in strings, and tied about their loins; and even here, on the confines of Egypt, at least one half of the Nubians appear in the same costume.

I do not know what has made me introduce these remarks upon the character and manners of the Nubians here, except it be to pave the way for the incidents of my walk down to Assouan. Wishing to get rid of my unpleasant feelings at parting with my companions, I began to bargain for one of the large heavy clubs, made of the palm-tree, which every Nubian carries, and bought what a Kentuckian would call a screamer, or an Irishman a toothpick; a large round club, about two inches in diameter, which seldom left my hand till I lost it in the Holy Land. Then seeing a Nubian riding backward and forward on a dromedary, showing his paces like a jockey at a horse-market, I began to bargain for him. I mounted him (the first time I had mounted a dromedary); and as I expected to have considerable use for him, and liked his paces, I was on the point of buying him, but was prevented by the sudden reflection that I had no means of getting him down to Cairo.

My next essay was upon more delicate ground. I began to bargain for the costume of a Nubian lady, and to use an expressive phrase, though in this case not literally true, I bought it off her back. One of my friends in Italy had been very particular in making a collection of ladies' costumes, and, to a man curious in those things, it struck me that nothing could be more curious than this. One of the elements of beauty is said to be simplicity; and if this be not a mere poetical fiction, and beauty when unadorned is really adorned.

the most, then was the young Nubian girl whose dress I bought adorned in every perfection. In fact, it was impossible to be more simple, without going back to the origin of all dress, the simple fig-leaf. She was not more than sixteen, with a sweet mild face, and a figure that the finest lady might be proud to exhibit in its native beauty; every limb charmingly rounded, and every muscle finely developed. It would have been a burning shame to put such a figure into frock, petticoat, and the other et ceteras of a lady's dress. I now look back upon this, and many other scenes, as strange, of which I thought nothing at the time, when all around was in conformity. I remember, however, though I thought nothing of seeing women all but naked, that at first I did feel somewhat delicate in attempting to buy the few inches that constituted the young girl's wardrobe. Paul had no such scruples, and I found, too, that as in the road to vice, "ce n'est que le premier pas qui coûte." In short, I bought it, and have it with me; and to the curious in such matters I have no hesitation in saying, that the costume of a Nubian lady is far more curious than any thing to be found in Italy, and would make a decided sensation at a masquerade or fancy ball.

It was nearly dark, when, from the ruined height of the old city of Assouan, I saw my little boat with the flag of my country, and near it, hardly less welcome to my eyes, the red-cross banner of England. The sight of these objects, assisted by my multifarious bargainings, relieved me from the loneliness I had felt in parting from my friends; and I went on board the English boat, hoping to find a party with which I had partially arranged to set out from Cairo, and which I was every day expecting. I was disappointed, however; but found a gentleman to whom I was then a stranger, the English consul at Alexandria. He had been eighteen years in the country, closely devoted to his public and private duties, without ever having been in Upper Egypt. On the point of returning home, to enjoy in his own country and among his own people the fruits of his honourable labours, he had now for the first time ascended the Nile. He was accompanied by his daughter, who had reigned as a belle and beauty in the ancient city of Cleopatra, and her newly married husband. Coming from home, their boat was furnished and fitted up with all kinds of luxuries. Their tea-table, in particular, made such a strong impression on me, that when I met them again at Thebes, I happened to find myself on board their boat regularly about the time for the evening meal. I was exceedingly pleased with Mr T——; so much so, that at Thebes I gave him the strongest mark of it a man could give—I borrowed money of him; and I have reason to remember his kindness in relieving me from a situation which might have embarrassed me.

Early the next morning the sails were already loosed and the stake pulled up, when Paul, from the bank, cried out, "A sail!" and looking down the river, I saw a boat coming up, and again the English flag. I furled my sails, fastened the stake, and waited till she came up, and found the party I had expected. I went on board, and breakfasted with them. They had started from Cairo on the same day with me, but with their large boats could not keep up with me against the wind. They had heard of me along the river; and, among other things, had heard of my having shot a crocodile. Waiting to see them off for the Island of Philo, and bidding them good-bye until we should meet at Thebes, I returned to my boat, and, letting fall the sails, before they were out of sight was descending the Nile.

My face was now turned towards home. Thousands of miles, it is true, were between us; but I was on the bosom of a mighty river, which was carrying me to the mightier ocean, and the waves that were rolling by my side were rapidly hurrying on, and might one day wash the shores of my native land. It was a beautiful prospect I had before me now. I could lie on the deck of my boat, and float hundreds of miles, shooting at crocodiles; or I could go ashore and ramble among modern villages, and the ruins of ancient cities, and

all the time I thought I would be advancing on my journey. Before night, however, the wind was blowing dead ahead, and we were obliged to furl our sails and take to our oars. But it was all of no use; our boat was blown along like a feather; carried round, backward and forward, across the river, zigzag, and at last fairly driven up the stream. With great difficulty we worked down to Ombos; and here, under the ruins of an ancient temple, part of which had already fallen into the river, we hauled up to the bank, and, in company with half a dozen Arab boats, lay by till morning.

Man is a gregarious animal. My boatmen always liked to stop where they saw other boats. I remember it was the same on the Ohio and Mississippi. Several years since, when the water was low, I started from Pittsburgh, in a flat-bottomed boat, to float down to New Orleans. There, too, we were in the habit of stopping along the bank at night, or in windy or foggy weather, and the scenes and circumstances were so different that the contrast was most interesting and impressive. Here we moored under the ruins of an ancient temple, there we made fast to the wild trees of an untrodden forest; here we joined half a dozen boats with eight or ten men in each, and they all gathered round a fire, sipped coffee, smoked, and lay down quietly to sleep; there we met the dashing roaring boys of the West, ripe for fun, frolic, or fight. The race of men "half horse, half alligator, and 'other half steam-boat," had not yet passed away, and whenever two boats met, these restless rovers must "do something;" play cards, pitch pennies, fight cocks, set fire to a house, or have a row of some description. Indeed, it always involved a long train of interesting reflections, to compare the stillness and quiet of a journey on this oldest of rivers with the moving castles and the splashing of paddle-wheels on the great rivers of the New World.

At daylight I had mounted the bank, and was groping among the ruins of the temple. The portico fronting the river is a noble ruin, nearly 100 feet in length, with three rows of columns, five in each row, 30 feet high, and 10 feet in diameter at the base. The principal figure on the walls is Osiris, with a crocodile head, and the sacred tau in his hand. The Ombites were distinguished for their worship of the crocodile, and this noble temple was dedicated to that bestial god: among the ruins are still to be seen the wall on which the sacred animal was led in religious procession, and the tank in which he was bathed.

Towards noon we were approaching Hadjar Silsily, or the Rock of the Chain, the narrowest part of the river, bounded on each side by ranges of sandstone mountains. On the eastern side are ancient quarries of great extent, with the same appearance of freshness as at Assouan. Nothing is known of the history of these quarries; but they seem to have furnished material enough for all the cities on the Nile, as well as the temples and monuments that adorned them. Whole mountains have been cut away; and while the solitary traveller walks among these deserted workshops, and looks at the smooth sides of the mountains, and the fragments of unfinished work around him, he feels a respect for the people who have passed away, greater than when standing among the ruins of their mighty temples; for here he has only the evidences of their gigantic industry, without being reminded of the gross and disgusting purposes to which that industry was prostituted. The roads worn in the stone by the ancient carriage-wheels are still to be seen, and somewhere among these extensive quarries travellers have found an unfinished sphinx. I remember one place where there was an irregular range of unfinished doors, which might well have been taken for the work of beginners, practising under the eyes of their masters. Paul took a philosophic and familiar view of them, and said, that it seemed as if, while the men were at work, the boys playing around had taken up the tools, and amused themselves by cutting these doors.

On the opposite side, too, are quarries, and several ranges of tombs, looking out on the river, excavated

in the solid rock, with pillars in front, and images of deities in the recesses for the altars. I remember a beautiful chamber overhanging the river like a balcony. It had been part of a temple, or perhaps a tomb. We thought of stopping there to dine, but our boat had gone ahead, and our want of provisions was somewhat of an impediment.

At about four o'clock we saw at a distance the minaret of Edfou. There was no wind, the men were gently pulling at the oars, and I took one myself, much to the uneasiness of the rais, who thought I was dissatisfied. Sloth forms so prominent a feature in the composition of the Orientals, and quiet is so material an item in their ideas of enjoyment, that they cannot conceive why a man should walk when he can stand, why he should stand when he can sit, or, in short, why he should do any thing when he can sit still and do nothing.

It was dark before we arrived at Edfou. I mean it was that period of time when, by nature's laws, it should be dark; that is, the day had ended, the sun had set with that rich and burning lustre which attends his departing glories nowhere but in Egypt, and the moon was shedding her pale light over the valley of the Nile. But it was a moon that lighted up all nature with a paler, purer, and more lovely light; a moon that would have told secrets; a moon—a moon—in short, a moon whose light enabled one to walk over fields without stumbling, and this was, at the moment, the principal consideration with me.

Edfou lies about a mile from the bank of the river, and, taking Paul and one of the Arabs with me, I set off to view the temple by moonlight. The town, as usual, contained mud houses, many of them in ruins, a mosque, a bath, bazaars, the usual apology for a palace, and more than the usual quantity of ferocious dogs; and at one corner of this miserable place stands one of the magnificent temples of the Nile. The propylon, its lofty proportions enlarged by the light of the moon, was the most grand and imposing portal I saw in Egypt. From a base of nearly 100 feet in length and 30 in breadth, it rises on each side the gate in the form of a truncated pyramid, to the height of 100 feet, gradually narrowing, till at the top it measures 75 feet in length and 18 in breadth. Judge, then, what was the temple to which this formed merely the entrance; and this was far from being one of the large temples of Egypt. It measured, however, 440 feet in length and 220 in breadth, about equal to the whole space occupied by St Paul's churchyard. Its dromos, pronaos, columns, and capitals, all correspond, and enclosing it is a high wall, still in a state of perfect preservation. I walked round it twice, and, by means of the wall erected to exclude the unhallowed gaze of the stranger, I looked down upon the interior of the temple. Built by the Egyptians for the highest uses to which a building could be dedicated, for the worship of their gods, it is now used by the pacha as a granary and storehouse. The portico and courtyard, and probably the interior chambers, were filled with grain. A guard was stationed to secure it against the pilfering Arabs; and to secure the fidelity of the guard himself, he was locked in at sunset, and the key left with the governor. The lofty entrance was closed by a wooden door; the vigilant guard was already asleep, and we were obliged to knock some time before we could wake him.

It was a novel and extraordinary scene, our parley with the guard at the door of the temple. We were standing under the great propylon, mere insects at the base of the lofty towers; behind us at a little distance sat a group of the miserable villagers, and leaning against a column in the porch of the temple was the indistinct figure of the guard, motionless, and answering in a low deep tone, like an ancient priest delivering the answers of the oracles. By the mellow light of the moon every thing seemed magnified; the majestic proportions of the temple appeared more majestic, and the miserable huts around it still more miserable, and the past glory and the present ruin of this once most favoured land rushed upon me with a force I had not felt even at the

foot of the pyramids. If the temple of that little unknown city now stood in Hyde Park or the garden of the Tuilleries, France, England, all Europe, would gaze upon it with wonder and admiration; and when thousands of years shall have rolled away, and they, too, shall have fallen, there will be no monument in those proudest of modern cities like this in the little town of Edfou, to raise its majestic head and tell the passing traveller the story of their former greatness.

Some of the Arabs proposed to conduct me to the interior through a passage opening from the ruined huts on the top; but after searching a while, the miserable village could not produce a candle, torch, or taper to light the way. But I did not care much about it. I did not care to disturb the strong impressions and general effect of that moonlight scene; and though in this, as in other things, I subject myself to the imputation of having been but a superficial observer, I would not exchange the lively recollection of that night for the most accurate knowledge of every particular stone in the whole temple.

I returned to my boat, and to the surprise of my rais ordered him to pull up stake and drop down the river. I intended to drop down about two hours to Elythias, or, in Arabic, Elkob. No one on board knew where it was, and, tempted by the mildness and beauty of the night, I staid on deck till a late hour. Several times we saw fires on the banks, where Arab boatmen were passing the night, and hailed them, but no one knew the place; and though seeking and inquiring of those who had spent all their lives on the banks of the river, we passed, without knowing it, a city which once carried on an extensive commerce with the Red Sea, where the traces of a road to the emerald mines and the fallen city of Berenice are still to be seen, and the ruins of whose temples, with the beautiful paintings in its tombs, excite the admiration of every traveller.

We continued descending with the current all night, and in the morning I betook myself to my old sport of shooting at crocodiles and pelicans. At about eleven o'clock we arrived at Esneh, the ancient Latopolis, so called from the worship of a fish, now containing 1500 or 2000 inhabitants. Here, too, the miserable subjects of the pacha may turn from the contemplation of their degraded state to the greatness of those who have gone before them. In the centre of the village, almost buried by the accumulation of sand from the desert and the ruins of Arab huts, is another magnificent temple. The street is upon a level with the roof, and a hole has been dug between two columns so as to give entrance to the interior. The traveller has by this time lost the wonder and indignation at the barbarity of converting the wonderful remains of Egyptian skill and labour to the meanest uses; and, descending between the excavated columns, finds himself, without any feeling of surprise, in a large cleared space, filled with grain, earthen jars, and Arabs. The gigantic columns, with their lotus-leaved capitals, are familiar things; but among the devices on the ceiling, his wandering eye is fixed by certain mysterious characters, which have been called the signs of the zodiac, and from which speculators in science have calculated that the temple was built more than 6000 years ago, before the time assigned by the Mosaic account as the beginning of the world.

But this little town contains objects of more interest than the ruin of a heathen temple; for here, among the bigoted followers of Mahommed, dwell fifty or sixty Christian families, being the last in Egypt, and standing on the very outposts of the Christian world. They exhibited, however, a melancholy picture of the religion they profess. The priest was a swarthy, scowling Arab, and, as Paul said, looked more like a robber than a pastor. He followed us for bucksheesh, and attended by a crowd of boys, we went to the house of the bishop. This bishop, as he is styled by courtesy, is a miserable-looking old man; he told us he had charge of the two churches at Esneh, and of all the Christians in the world beyond it to the south. His flock consists of about 200, poor wanderers from the true principles of Christianity, and knowing it only as teaching them to

make the sign of the cross, and to call upon the Son, and Virgin, and a long calendar of saints. Outside the door of the church was a school; a parcel of dirty boys sitting on the ground, under the shade of some palm-trees, with a more dirty blind man for their master, who seemed to be at the work of teaching because he was not fit for any thing else. I turned away with a feeling of melancholy, and almost blushed in the presence of the haughty Mussulmans, to recognise the ignorant and degraded objects around me as my Christian brethren.

## CHAPTER X.

Thebes, its Temples and great Ruins.—The Obelisk of Luxor, now of Paris.—An Avenue of Sphinxes.—Carnac.—The Mummy Pits.—The Tombs of the Kings.—The Memnonium.

It was nearly noon, when, with a gentle breeze, we dropped into the harbour of Thebes. The sun was beating upon it with meridian splendour; the inhabitants were seeking shelter in their miserable huts from its scorching rays; and when we made fast near the remains of the ancient port, to which, more than thirty centuries ago, the Egyptian boatman tied his boat, a small group of Arabs, smoking under the shade of some palm-trees on a point above, and two or three stragglers who came down to the bank to gaze at us, were the only living beings we beheld in a city which had numbered its millions. When Greece was just emerging from the shades of barbarism, and before the name of Rome was known, Egypt was far advanced in science and the arts, and Thebes the most magnificent city in the world. But the Assyrian came and overthrew for ever the throne of the Pharaohs. The Persian war-cry rang through the crowded streets of Thebes, Cambyzes laid his destroying hands upon the temples of its gods, and a greater than Babylon the Great fell to rise no more.

The ancient city was twenty-three miles in circumference. The valley of the Nile was not large enough to contain it, and its extremities rested upon the bases of the mountains of Arabia and Africa. The whole of this great extent is more or less strewn with ruins, broken columns, and avenues of sphinxes, colossal figures, obelisks, pyramidal gateways, porticoes, blocks of polished granite, and stones of extraordinary magnitude, while above them, "in all the nakedness of desolation," the colossal skeletons of giant temples are standing "in the unwatered sands, in solitude and silence. They are neither grey nor blackened; there is no lichen, no moss, no rank grass or mantling ivy, to robe them and conceal their deformities. Like the bones of man, they seem to whiten under the sun of the desert." The sand of Africa has been their most fearful enemy; blown upon them for more than 3000 years, it has buried the largest monuments, and, in some instances, almost entire temples.

At this day the temples of Thebes are known almost every where, by the glowing reports of travellers. Artists have taken drawings of all their minute details, and I shall refer to them very briefly. On the Arabian side of the Nile are the great temples of Luxor and Carnac. The temple of Luxor stands near the bank of the river, built there, as is supposed, for the convenience of the Egyptian boatmen. Before the magnificent gateway of this temple, until within a few years, stood two lofty obelisks, each a single block of red granite, more than eighty feet high, covered with sculpture and hieroglyphics fresh as if but yesterday from the hands of the sculptor. One of them has been lately taken down by the French, and at this moment rears its daring summit to the skies in the centre of admiring Paris; the other is yet standing on the spot where it was first erected.

Between these and the grand propylon are two colossal statues with mitred head-dresses, also single blocks of granite, buried to the chest by sand, but still rising more than twenty feet above the ground. The grand propylon is a magnificent gateway, more than 200 feet in length at its present base, and more than 60 feet above the sand. The whole front is covered with sculpture—the battle scenes of an Egyptian warrior, designed and exe-

cuted with extraordinary force and spirit. In one compartment the hero is represented advancing at the head of his forces, and breaking through the ranks of the enemy; then standing, a colossal figure, in a car drawn by two fiery horses, with feathers waving overhead, the reins tied round his body, his bow bent, the arrow drawn to its head, and the dead and wounded lying under the wheels of his car and the hoofs of his horses. In another place several cars are seen in full speed for the walls of a town, fugitives passing a river, horses, chariots, and men, struggling to reach the opposite bank, while the hero, hurried impetuously beyond the rank of his own followers, is standing alone among the slain and wounded who have fallen under his formidable arm. At the farthest extremity he is sitting on a throne as a conqueror, with a sceptre in his hand, a row of the principal captives before him, each with a rope around his neck; one with outstretched hands imploring pity, and another on his knees to receive the blow of the executioner, while above is the vanquished monarch, with his hands tied to a car, about to grace the triumph of the conqueror.

Passing this magnificent entrance, the visitor enters the dromos, or large open court, surrounded by a ruined portico formed by a double row of columns covered with sculpture and hieroglyphics; and working his way over heaps of rubbish and Arab huts, among stately columns twelve feet in diameter, and between thirty and forty feet in height, with spreading capitals resembling the budding lotus, some broken, some prostrate, some half buried, and some lofty and towering as when they were erected, at the distance of 600 feet reaches the sanctuary of the temple.

But great and magnificent as was the temple of Luxor, it served but as a portal to the greater Carnac. Standing nearly two miles from Luxor, the whole road to it was lined with rows of sphinxes, each of a solid block of granite. At this end they are broken, and, for the most part, buried under the sand and heaps of rubbish. But approaching Carnac, they stand entire, still and solemn as when the ancient Egyptian passed between them to worship in the great temple of Ammon. Four grand propylons terminate this avenue of sphinxes, and, passing through the last, the scene which presents itself defies description. Belzoni remarks of the ruins of Thebes generally, that he felt as if he were in a city of giants; and no man can look upon the ruins of Carnac without feeling humbled by the greatness of a people who have passed away for ever. The western entrance, facing the temple of Northern Dair on the opposite side of the river, also approached between two rows of sphinxes, is a magnificent propylon 400 feet long and 40 feet in thickness. In the language of Dr Richardson, "looking forward from the centre of this gateway, the vast scene of havoc and destruction presents itself in all the extent of this immense temple, with its columns, and walls, and immense propylons, all prostrate in one heap of ruins, looking as if the thunders of heaven had smitten it at the command of an insulted God."

The field of ruins is about a mile in diameter; the temple itself 1200 feet long and 420 broad. It has twelve principal entrances, each of which is approached through rows of sphinxes, as across the plain from Luxor, and each is composed of propylons, gateways, and other buildings, in themselves larger than most other temples; the sides of some of them are equal to the bases of most of the pyramids, and on each side of many are colossal statues, some sitting, others erect, from twenty to thirty feet in height. In front of the body of the temple is a large court, with an immense colonnade on each side, of thirty columns in length, and through the middle two rows of columns fifty feet in height; then an immense portico, the roof supported by 134 columns, from twenty-six feet to thirty-four feet in circumference. Next were four beautiful obelisks more than seventy feet high, three of which are still standing; and then the sanctuary, consisting of an apartment twenty feet square, the walls and ceiling of large blocks of highly-polished granite, the ceiling studded with stars on a blue ground, and the

walls covered with sculpture and hieroglyphics representing offerings to Osiris, illustrating the mysterious uses of this sacred chamber, and showing the degrading character of the Egyptian worship. Beyond this is another colonnade, and again porticoes and walls to another propylon, at a distance of 2000 feet from the western extremity of the temple.

But these are not half of the ruins of Thebes. On the western side of the river, besides others prostrate and nearly buried under the sands, but the traces of which are still visible, the temples of Gornou, Northern Dair, Dair-el-Medinet, the Memnonium, and Medinet Abou, with their columns, and sculpture, and colossal figures, still raise their giant skeletons above the sands. Volumes have been written upon them, and volumes may yet be written, and he that reads all will still have but an imperfect idea of the ruins of Thebes. I will only add, that all these temples were connected by long avenues of sphinxes, statues, propylons, and colossal figures, and the reader's imagination will work out the imposing scene that was presented in the crowded streets of the now desolate city, when with all the gorgeous ceremonies of pagan idolatry, the priests, bearing the sacred image of their god, and followed by thousands of the citizens, made their annual procession from temple to temple, and, "with harps, and cymbals, and songs of rejoicing," brought back their idol, and replaced him in his shrine in the grand temple at Carnac.

The rambler among the ruins of Thebes will often ask himself, "Where are the palaces of the kings, and princes, and people, who worshipped in these mighty temples?" With the devout though degraded spirit of religion that possessed the Egyptians, they seem to have paid but little regard to their earthly habitations; their temples and their tombs were the principal objects that engrossed the thoughts of this extraordinary people. It has been well said of them that they regarded the habitations of the living merely as temporary resting-places, while the tombs were regarded as permanent and eternal mansions; and while not a vestige of a habitation is to be seen, the tombs remain monuments of splendour and magnificence, perhaps even more wonderful than the ruins of their temples. Clinging to the cherished doctrine of the metempsychosis, the immortal part, on leaving its earthly tenement, was supposed to become a wandering, migratory spirit, giving life and vitality to some bird of the air, some beast of the field, or some fish of the sea, waiting for a regeneration in the natural body. And it was of the very essence of this faith to inculcate a pious regard for the security and preservation of the dead. The whole mountain-side on the western bank of the river is one vast necropolis. The open doors of tombs are seen in long ranges, and at different elevations, and on the plain large pits have been opened, in which have been found 1000 mummies at a time. For many years, and until a late order of the pacha preventing it, the Arabs have been in the habit of rifling the tombs to sell the mummies to travellers. Thousands have been torn from the places where pious hands had laid them, and the bones meet the traveller at every step. The Arabs use the mummy-cases for firewood, the bituminous matters used in the embalment being well adapted to ignition; and the epicurean traveller may cook his breakfast with the coffin of a king. Notwithstanding the depredations that have been committed, the mummies that have been taken away and scattered all over the world, those that have been burnt, and others that now remain in fragments around the tombs, the numbers yet undisturbed are no doubt infinitely greater; for the practice of embalming is known to have existed from the earliest periods recorded in the history of Egypt; and by a rough computation, founded upon the age, the population of the city, and the average duration of human life, it is supposed that there are from 8,000,000 to 10,000,000 of mummied bodies in the vast necropolis of Thebes.

Leaving these resting-places of the dead, I turn for one moment to those of more than royal magnificence, called the tombs of the kings. The world can show

nothing like them; and he who has not seen them can hardly believe in their existence. They lie in the valley of Biban-el-Melook, a dark and gloomy opening in the sandstone mountains, about three quarters of an hour from Gornou. The road to them is over a dreary waste of sands, and their doors open from the most desolate spot that the imagination can conceive.

Diodorus Siculus says that forty-seven of these tombs were entered on the sacred registers of the Egyptian priests, only seventeen of which remained at the time of his visit to Egypt, about sixty years B. C. In our own days, the industry and enterprise of a single individual, the indefatigable Belzoni, have brought to light one that was probably entirely unknown in the time of the Grecian traveller. The entrance is by a narrow door; a simple excavation in the side of the mountain, without device or ornament. The entrance-hall, which is extremely beautiful, is twenty-seven feet long and twenty-five broad, having at the end a large door opening into another chamber, twenty-eight feet by twenty-five, the walls covered with figures drawn in outline, but perfect as if recently done. Descending a large staircase, and passing through a beautiful corridor, Belzoni came to another staircase, at the foot of which he entered another apartment, twenty-four feet by thirteen, and so ornamented with sculpture and paintings that he called it the Hall of Beauty. The sides of all the chambers and corridors are covered with sculpture and paintings; the colours appearing fresher as the visitor advances towards the interior of the tomb; and the walls of this chamber are covered with the figures of Egyptian gods and goddesses, seeming to hover round and guard the remains of the honoured dead.

Farther on is a large hall, twenty-eight feet long and twenty-seven broad, supported by two rows of square pillars, which Belzoni called the Hall of Pillars; and beyond this is the entry to a large saloon with a vaulted roof, thirty-two feet in length and twenty-seven in breadth. Opening from this were several other chambers of different dimensions, one of them unfinished, and one forty-three feet long by seventeen feet six inches wide, in which he found the mummy of a bull; but in the centre of the grand saloon was a sarcophagus of the finest oriental alabaster, only two inches thick, minutely sculptured within and without with several hundred figures, and perfectly transparent when a light was placed within it.

All over the corridors and chambers the walls are adorned with sculptures and paintings in intaglio and relief, representing gods, goddesses, and the hero of the tomb in the most prominent events of his life, priests, religious processions and sacrifices, boats and agricultural scenes, and the most familiar pictures of everyday life, in colours as fresh as if they were painted not more than a month ago; and the large saloon, lighted up with the blaze of our torches, seemed more fitting for a banqueting-hall, for song and dance, than a burial-place of the dead. All travellers concur in pronouncing the sudden transition from the dreary desert without to these magnificent tombs as operating like a scene of enchantment; and we may imagine what must have been the sensations of Belzoni, when, wandering with the excitement of a first discoverer through these beautiful corridors and chambers, he found himself in the great saloon leaning over the alabaster sarcophagus. An old Arab who accompanied us remembered Belzoni, and pointed out a chamber where the fortunate explorer entertained a party of European travellers who happened to arrive there at that time, making the tomb of Pharaoh\* ring with shouts and songs of merriment.

At different times I wandered among all these tombs. All were of the same general character; all possessed the same beauty and magnificence of design and finish, and in all, at the extreme end, was a large saloon, adorned with sculpture and paintings of extraordinary beauty, and containing a single sarcophagus. "The kings of the nations did lie in glory, every one in his own house, but thou art cast out of thy grave like an

\* Supposed to be the tomb of Pharaoh Necho.

abominable branch." Every sarcophagus is broken, and the bones of the kings of Egypt are scattered. In one I picked up a skull. I mused over it a moment, and handed it to Paul, who moralised at large. "That man," said he, "once talked, and laughed, and sang, and danced, and ate maccaroni." Among the paintings on the walls was represented a heap of hands severed from the arms, showing that the hero of the tomb had played the tyrant in his brief hour on earth. I dashed the skull against a stone, broke it in fragments, and pocketed a piece as a memorial of a king. Paul cut off one of the ears, and we left the tomb.

Travellers and commentators concur in supposing that these magnificent excavations must have been intended for other uses than the burial, each of a single king. Perhaps, it is said, like the chambers of imagery seen by the Jewish prophet, they were the scene of idolatrous rites performed "in the dark;" and as the Israelites are known to have been mere copyists of the Egyptians, these tombs are supposed to illustrate the words of Ezekiel: "Then said he to me, Son of man, dig now in the wall; and when I had digged in the wall, behold a door. And he said unto me, Go in and see the abominable things that they do there. So I went in, and saw, and behold, every form of creeping thing and abominable beasts, and all the idols of the house of Israel, pourtrayed upon the wall round about."—Ezek. viii. 8-10.

Amid the wrecks of former greatness which tower above the plain of Thebes, the inhabitants who now hover around the site of the ancient city are perhaps the most miserable in Egypt. On one side of the river they build their mud huts around the ruins of the temples, and on the other their best habitations are in the tombs; wherever a small space has been cleared out, the inhabitants crawl in, with their dogs, goats, sheep, women, and children; and the Arab is passing rich who has for his sleeping-place the sarcophagus of an ancient Egyptian.

I have several times spoken of my intended journey to the great Oasis. Something was yet wanting in my voyage on the Nile. It was calm, tame, and wanting in that high excitement which I had expected from travelling in a barbarous country. A woman and child might go safely from Cairo to the Cataracts; and my blood began to run sluggishly in my veins. Besides, I had a great curiosity to see an oasis; a small spot of green fertile land in the great desert, rising in solitary beauty before the eyes of the traveller, after days of journeying through arid wastes, and divided by vast sandy ramparts from the rest of the world. The very name of the great Oasis in the Libyan Desert carried with it a wild and almost fearful interest, too powerful for me to resist. It was beyond the beaten track; and the sheik with whom I made my arrangements insisted on my taking a guard, telling me that he understood the character of his race, and an Arab in the desert could not resist the temptation to rob an unprotected traveller. For my own part, I had more fear of being followed by a party of the very unprepossessing fellows who were stealthily digging among the tombs, and all of whom knew of the preparations for our journey, than from any we might encounter in the desert. I must confess, however, that I was rather amused when I reviewed my body-guard, and, with the gravest air in the world, knocked out the primings from their guns, and primed them anew with the best of English powder. When I got through, I was on the point of discharging them all together; but it would have broken the poor fellows' hearts to disappoint them of their three piastres (about fifteen cents) per diem, dearly earned by a walk all day in the desert, and a chance of being shot at.

In the afternoon before the day fixed for my departure, I rode by the celebrated Memmons, the Damy and Shamy of the Arabs. Perhaps it was because it was the last time, but I had never before looked upon them with so much interest. Among the mightier monuments of Thebes, her temples and her tombs, I had passed these ancient statues with a comparatively careless eye, scarcely even bestowing a thought upon the vocal Mem-

non. Now I was in a different mood, and looked upon its still towering form with a feeling of melancholy interest. I stood before it and gazed up at its worn face, its scars and bruises, and my heart warmed to it. It told of exposure, for unknown ages, to the rude assaults of the elements and the ruder assaults of man. I climbed upon the pedestal, upon the still hardy legs of the Memnon. I pored over a thousand inscriptions in Greek and Latin. A thousand names of strangers from distant lands, who had come like me to do homage to the mighty monuments of Thebes; Greeks and Romans who had been in their graves more than 2000 years, and who had written with their own hands that they had heard the voice of the vocal Memnon. But, alas! the voice has departed from Memnon; the soul has fled, and it stands a gigantic skeleton in a grave of ruins. I returned to my boat, and in ten minutes thereafter, if the vocal Memnon had bellowed in my ears, he could not have awaked me.

#### CHAPTER XI.

The Arabs and the Pacha.—March into the Desert.—Arab Christians.—A cold Reception.—Arab Punctuality.—A Night in a Convent.—An Arab Christian Priest.—Speculative Theology.—A Journey ended before commenced.

EARLY in the morning I was on the bank, waiting for my caravan and guides. I had every thing ready, rice, maccaroni, bread, biscuit, a hare, and a few shirts. I had given instructions to my rais to take my boat down to Siout, and wait for me there, as my intention was to go from the great Oasis to the Oasis of Siwah, containing the ruins of the temple of Jupiter Ammon, to destroy which Cambyses had sent from this very spot an army of 50,000 men, who, by the way, left their bones on the sands of Africa; and I need not remind the reader that Alexander the Great had visited it in person, and been acknowledged by the priest as the son of Jupiter. I waited a little longer, and then, becoming impatient, mounted a donkey to ride to the sheik's. My rais and crew accompanied me a little way; they were the only persons to bid us farewell; and, as Paul remarked, if we never got back, they were the only persons to make any report of us to our friends.

The sheik's house was situated near the mountains, in the midst of the tombs forming the great necropolis of Thebes, and we found him surrounded by fifty or sixty men, and women and children without number, all helping to fit out the expedition. There did not appear to be much choice among them, but I picked out my body-guard; and when I looked at their swarthy visages by broad daylight, I could not help asking the sheik what security I had against them. The sheik seemed a little touched, but, pointing to the open doors of the tombs, and the miserable beings around us, he said he had their wives and children in his hands as pledges for my safety. Of the sheik himself I knew nothing, except that he was sheik. I knew, too, that though by virtue of the pacha's firman he was bound to do every thing he could for me, he was no friend to the pacha or his government; for one evening, in speaking of the general poverty of the Arabs, he said that if one fourth of them owned a musket, one charge of powder, and one ball, before morning there would not be a Turk in Egypt. However, I knew all this before.

At 12 o'clock the last sack of biscuit was packed upon the camels, and I mounted a fine dromedary, while my companions bade farewell to their wives, children, and friends; a farewell so calm and quiet, particularly for a people whose blood was warmed by the burning sun of Africa, that it seemed cold and heartless.

My caravan consisted of six camels, or rather four camels and two dromedaries, two camel-drivers armed with swords, eight men with pistols and muskets, Paul, and myself. It was the first time I had undertaken a journey in the desert. My first endeavour was to learn something of the character of my companions, and even Paul became perfectly satisfied and pleased with the journey, when, upon acquaintance, he found that their ugly outsides gave no true indication of the inward man.

Our guide, he who was to conduct us through the pathless desert, was not yet with us; he lived at a village about four miles distant, and a messenger had been sent forward to advise him of our coming. Riding for the last time among the ruined temples of Thebes, beyond the limits of the ancient city, our road lay behind the valley bordering the river, and along the edge of the desert. On one side was one of the richest and most extensive valleys of the Nile, well cultivated, and at this season of the year covered with the richest greens; on the other were barren mountains and a sandy desert.

In about four hours we saw, crossing the valley and stopping on the edge of the desert, a single Arab. It was our messenger, come to tell us that our guide would meet us at a Christian church about four hours' march in the desert. We now left the borders of the valley, and struck directly into the desert. Before us, at some distance over a sandy plain, was a high range of sandstone mountains, and beyond these was the mighty waste of sand and barrenness. Towards evening we saw from afar the church at which we were to meet our guide. It was the only object that rose above the level of the sands; and as the setting sun was fast reminding us that the day was closing, it looked like a resting-place for a weary traveller.

Congratulating myself upon my unexpected good fortune in meeting with those who bore the name of Christians, I was still more happy in the prospect, for this night at least, of sleeping under a roof. As we approached, we saw the figure of a man stealing along the wall, and were near enough to hear the hasty closing of the door and the heavy drawing of bolts inside. It was nine o'clock when we dismounted and knocked at the door of the convent, but received no answer; we knocked again and again without success. We then commenced a regular battery. I rattled against the door with my Nubian club in a small way, like Richard at the gate of the castle of Front de Bœuf; but my blows did not tell like the battle-axe of the Lion-hearted, and the churlish inmates, secure behind their strong walls, paid no regard to us. Tired of knocking, and irritated at this inhospitable treatment from men calling themselves Christians, I walked round the building to see if by accident there was not some back-door left open. The convent was enclosed by a square wall of unburnt brick, twelve or fourteen feet high, and not a door, window, or loop-hole, was to be seen. It was built for defence against the roving Arabs, and if we had intended to storm it, we could not have found an assailable point. I returned, vexed and disappointed; and calling away my men, and almost cursing the unchristian spirit of its inmates, I pitched my tent under its walls, and prepared to pass the night in the desert.

I had hardly stretched myself upon my mat before I heard the smart trot of a dromedary, and presently my guide, whom I had almost forgotten, dismounted at the door of the tent. He was a tall, hard-faced, weather-beaten man of about fifty, the white hairs just beginning to make their appearance in his black beard. I wanted to have a good view of him, and, calling him inside, gave him a seat on the mat, a pipe, and coffee. He told me that for many years he had been in the habit of going once a-year to the Oasis, on a trading voyage, and that he knew the road perfectly. Almost the first thing he said was, that he supposed I intended to remain there the next day. The Arabs, like most other Orientals, have no respect for the value of time; and among the petty vexations of travelling among them, few annoyed me more than the eternal "bokhara, bokhara"—"to-morrow, to-morrow." When they first sent to this guide to know whether he could engage with me, he said he was ready at any moment, by which he probably meant a week's notice; and when they sent word that I had named a particular day, he probably thought that I would be along in the course of two or three thereafter, and was no doubt taken by surprise when the messenger came to tell him that I was already on the march. I, of course, had no idea of remaining there. He told me that I had better stay;

that one day could not make any difference, and finally said he had no bread baked, and must have a day or two to prepare himself. I answered that he had told the sheik at Thebes that he would be ready at any moment; that it was absurd to think I would wait there in the desert; that I would not be trifled with, and if he were not ready the next morning, I would ride over to his village and make a complaint to the sheik. After a long parley, which those only can imagine who have had to deal with Arabs, he promised to be there at sunrise the next morning, and took his leave.

After supper, when, if ever, a man should feel good-natured, I began again to feel indignant at the churlish inmates of the convent, and resolved upon another effort to see what stuff these Christians were made of. I knew that the monks in these isolated places, among fanatic Mussulmans, were sometimes obliged to have recourse to carnal weapons; and telling Paul to keep a look-out, and give me notice if he saw the barrel of a musket presenting itself over the wall, I again commenced thundering at the door; almost at the first blow it was thrown wide open, with a suddenness that startled me, and a dark, surly, and half-naked Arab stood facing me in the doorway. He had been reconnoitring, and though not sufficiently assured to come out and welcome us, he was ready to open when again summoned. With no small degree of asperity, and certainly without the meekness of the character upon which I was then presuming, I asked him if that was his Christian spirit, to let a stranger and a Christian sleep outside his walls when he had a roof to shelter him; and before he could interpose a word, I had read him a homily upon the Christian virtues that would have done credit to some pulpits. He might have retorted upon me, that with the Christian duties coming so glibly from my tongue, I was amazingly deficient in the cardinal virtue of forbearance; but I had the satisfaction of learning that I had not been excluded by the hands of Christians. The priests and monks had gone to a neighbouring village, and he was left alone. I followed him through a sort of courtyard into a vestibule, where was a noble fire, with a large caldron boiling over it. He neither asked me to stay, nor told me to go, and seated himself by the fire, perfectly indifferent to my movements. As soon as I had satisfied myself that he was alone, and saw that my Arabs had followed me, I thought I ran no risk in considering the building as a castle which I had stormed, and him as the captive of my bow and spear. I therefore required him to show me the interior of the convent, and he immediately took up a blazing stick from the fire, and conducted me within; and when I told him that I meant to sleep there, he said it would be for him a night "white as milk."

From the vestibule the door opened into the chapel, which consisted of a long apartment running transversely, the door in the centre; the floor was covered with mats, ostrich-eggs were suspended from the ceilings, and three or four recesses contained altars to favourite saints. Directly opposite the door was a larger recess, in which stood the great altar, separated by a railing, ornamented with bone and mother-of-pearl, and over the top were four pictures of St George slaying the dragon. I walked up and down the chapel two or three times, followed in silence by my swarthy friends, not altogether with the reverential spirit of a pious Christian, but with the prudence of a man of the world, looking out for the best place to sleep, and finally deposited my mat at the foot of the great altar.

I might better have slept on the sand after all, for the walls of the church were damp, and a strong current of air from the large window above had been pouring in upon me the whole night. When I first woke, I felt as if pinned to the floor, and I was startled and alarmed at the recurrence of a malady, on account of which I was then an exile from home. I went outside, and found, although it was late, that the guide had not come. If he had been there, I should no doubt have gone on; but, most fortunately for me, I had time to reflect. I was a changed man since the day before; my buoyancy

of spirits was gone, and I was depressed and dejected. I sent a messenger, however, for the guide; and while I was sitting under the walls, hesitating whether I should expose myself to the long and dreary journey before me, I saw four men coming across the desert towards the convent. They were the priest and three of his Christian flock; and their greeting was such as to make me reproach myself for the injustice I had done the Arab Christians, and feel that there was something in that religion, even in the corrupt state in which it existed there, that had power to open and warm the heart. The priest was a tall thin man, his dark face almost covered with a black beard and mustaches, and wore the common blue gown of the better class of Arabs, with a square black cap on his head, and his feet bare. I could not understand him, but I could read in his face that he saluted me as a brother Christian, and welcomed me to all that a brother Christian could give.

Living as we do, in a land where the only religious difference is that of sect, and all sects have the bond of a common faith, it is difficult to realise the feeling which draws together believers in the same God and the same Redeemer, in lands where power is wielded by the worshippers of a false religion. One must visit a country in which religion is the dividing line, where haughty and deluded fanatics are the masters, and hear his faith reviled, and see its professors persecuted and despised, to know and feel how strong a tie it is.

After exchanging our greetings outside, the priest led the way to the church. I do not know whether it was a customary thing, or done specially in honour of me (Paul said the latter); but, at any rate, he immediately lighted up the edifice, and, slipping over his frock a dirty white gown, with a large red cross down the back, commenced the service of the mass. His appearance and manner were extremely interesting, and very different from those of the priest I had seen at Esneh. His fine head, his noble expression, his earnestness, his simplicity, his apparent piety, his long black beard and mustaches, his mean apparel and naked feet, all gave him the primitive aspect of an apostle. He was assisted by a dirty, ragged, barefooted boy, who followed him round with a censer of incense, vigorously perfuming the church from time to time, and then climbing up a stand, holding on by his naked feet, and reading a lesson from the thumbed, torn, and tattered leaves of an Arabic Bible. There were but three persons present besides myself; poor, ignorant people, far astray, no doubt, from the path of true Christianity, but worshipping, in all honesty and sincerity, according to the best light they had, the God of their fathers. The priest went through many long and unmeaning forms, which I did not understand, but I had seen things quite as incomprehensible to me in the splendid cathedrals of Europe, and I joined, so far as I could, in the humble worship of these Egyptian Christians. There were no vessels of silver and gold, no imposing array of costly implements, to captivate the senses. A broken tumbler, a bottle of wine, and three small rolls of bread, formed the simple materials for the holy rite of the Lord's Supper. The three Arabs partook of it, and twice it was offered to me; but the feelings with which I had been accustomed to look upon this solemn sacrifice forbade me to partake of the consecrated elements, and never did I regret my unworthiness so bitterly as when it prevented me from joining in the holy feast with these simple-hearted Christians. In the meantime Paul came in, and the service being ended, I fell into conversation with the priest. He was a good man, but very ignorant, weak, and of great simplicity of character. He conducted me around the little church into the several chapels, and pointed out all that he thought curious, and particularly the ornaments of bone and mother-of-pearl; and, finally, with a most imposing air, like a priest in a church in Italy uncovering the works of the first masters, he drew the curtain from the four pictures of St George slaying the dragon, and looked at me with an air of great satisfaction to enjoy the expression of my surprise and astonishment. I did not disappoint him, nor

did I tell him that I had the night before most irreverently drawn aside the curtain, and exposed these sacred specimens of the arts to the eyes of my unbelieving Arabs; nor did I tell him that, in each of the four, St George seemed to be making a different thrust at the dragon. There was no use in disturbing the complacency of the poor priest; he had but little of which he could be proud, and I would not deprive him of that. Leaving him undisturbed in his exalted opinion of St George and his dragons, I inquired of him touching the number and condition of the Christians under his charge, and their state of security under the government of the pacha; and, among other things, asked him if they increased. He told me that they remained about the same, or perhaps rather decreased. I asked him if a Mussulman ever became a Christian. He answered never, but sometimes a Christian would embrace the religion of Mahommed, and assigned a cause for this unhappy difference which I am sorry to mention, being no less than the influence of the tender passion. He told me that, in the free intercourse now existing under the government of the pacha between Christians and Mussulmans, it often happened that a Christian youth became enamoured of a Moslem girl; and as they could not by any possibility marry and retain their separate religions, it was necessary that one of them should change. The Moslem dare not, for death by the hands of her own friends would be the certain consequence, while the Christian, instead of running any temporal risks, gains with his bride the protection and favour of the Mussulmans. Paul seemed rather scandalised at this information, and began to catechise the priest on his own account. I could not understand the conversation, but could judge, from the movements, that Paul was examining him on that cardinal point, the sign of the cross. All appeared to go smoothly enough for a little while, but I soon noticed the flashing of Paul's eyes, and sundry other symptoms of indignation and contempt. I asked him several times what it was all about; but, without answering, he walked backward and forward, slapping his hands under the priest's nose, and talking louder and faster than ever, and I had to take hold of him, and ask him sharply what the plague was the matter, before I could get a word out of him. "A pretty Christian," said Paul; "fast fifty-six days for Lent, when we fast only forty-six; forty that our Saviour was in the mount, and six Sundays." I told him there was not so much difference between them as I thought, as it was only ten days; he looked at me for a moment, and then, as if fearful of trusting himself, shrugged his shoulders, and marched out of the chapel. During all this time, the condition of the poor priest was pitiable and amusing; he had never been so sharply questioned before, and he listened with as much deference to Paul's questions and rebukes as if he had been listening to the Pope of Rome, and, when it was over, looked perfectly crest-fallen.

It was twelve o'clock when the man we had sent after the guide returned, but before this time my malady had increased to such a degree as to leave me no option; and I had resolved to abandon the Oasis, and go back to Thebes. I had great reason to congratulate myself upon my accidental detention, and still greater that the symptoms of my malady had developed themselves before I had advanced another day's journey in the desert. Still, it was with a heavy heart that I mounted my dromedary to return. I had not only the regret of being compelled abruptly to abandon a long-cherished plan, but I had great uneasiness as to what was to become of me on my arrival at Thebes. My boat was probably already gone. I knew that no other could be obtained there, and, if obliged to wait for a casual opportunity, I must live in my tent on the banks of the river, or in one of the tombs. My anxieties, however, were quickly dispelled on my arrival at Thebes, where I found the English gentleman and lady whom I had met at Cairo, and afterwards at the Cataracts. They kindly took me on board their boat; and so ended my expedition to the great Oasis.

## CHAPTER XII.

A Travelling Artist and Antiquary.—An Egyptian Sugar-house.—Grecian Architecture.—A Melancholy Greeting.—Tyranny of the Pacha.—Amateurs of Physic.—Memphis.—Adventure with a Wild Boar.—Perils of a Pyramid.—The Catacombs of Birds.—Amor Patriæ.—Voyaging on the Nile.

I SHALL never forget the kindness of these excellent friends; and, indeed, it was a happy thing for me that my own boat had gone, and that I was thrown upon their hospitality; for, in addition to the greater comforts I found with them, I had the benefit of cheerful society, under circumstances when to be alone would have been horrible. Even when we arrived at Siout, after a voyage of seven days, they would not let me leave them, but assumed the right of physicians, and prescribed that I should be their guest until perfectly restored. I remained, accordingly, three days longer with them, my little boat following like a tender to a man-of-war, and passed my time luxuriously. I had books, conversation, and a medicine-chest. But one thing troubled me. We had a cook who looked upon his profession as a liberal and enlightened science, and had attained its very highest honours. He had served various noblemen of eminent taste, had accumulated 50,000 dollars, and was now cooking at the rate of fifty dollars a-month upon the Nile. Michel was an extraordinary man. He came from the mountains of Dalmatia, near the shores of the Adriatic; one of a small nation who had preserved the name, and form, and spirit of a republic against Italians, Hungarians, and Turks, and fell only before the irresistible arm of Napoleon. He had been a great traveller in his youth, and, besides his attainments in the culinary art, was better acquainted with history, ancient and modern, than almost any man I ever met. He had two great passions, the love of liberty and the love of the fine arts (cookery included), and it was really extraordinary to hear him, with a ladle in his hand, and tasting, from time to time, some piquant sauce, discourse of the republics of Rome and America, of the ruins of Italy, Palmyra, and Egypt. Michel's dinners, making proper allowance for the want of a daily market, would have done honour to the best lord he ever served; and I was obliged to sit down, day after day, to my tea, rice-water, biscuit, &c., and listen to the praises of his dainties while they passed untasted from me.

It was not until within two days of Cairo that we parted, with an agreement to meet at Jerusalem and travel together to Palmyra. We did meet for a few moments at Cairo, but the plague was beginning to rage, the pacha had been putting himself into quarantine, and we had barely time to renew our engagement, which a particularly unfortunate circumstance (the illness of Mrs S.) prevented us from keeping, and we never met again. Few things connected with my compelled departure from the Holy Land gave me more regret than this; and if these pages should ever meet their eyes, they will believe me when I say that I shall remember, to the last day of my life, their kindness on the Nile.

The story of my journeying on this river is almost ended. Kenneh was our first stopping-place on our way down; a place of considerable note, there being a route from it across the desert to Cosseir, by which many of the pilgrims, and a great portion of the trade of the Red Sea, are conveyed.

At Ramaïoum, not far below Siout, we went ashore to visit a sugar-factory belonging to the pacha. This manufactory is pointed out as one of the great improvements introduced into Egypt, and, so far as it shows the capabilities of the Arabs, of which, however, no one can doubt, it may be considered useful. Formerly eighty Europeans were employed in the factory, but now the work is carried on entirely by Arabs. The principal was educated in France at the expense of the pacha, and is one of the few who have returned to render any service to their country and master. The enlightened pacha understands thoroughly that liberal principle of political economy which consists in encouraging domestic manufactures, no matter at what expense. The

sugar costs more than that imported, and is bought by none but governors and dependents of the pacha. It is made from cane, contains a great deal of saccharine matter, and has a good taste, but a bad colour. This factory, however, can hardly be considered as influential upon the general interests of the country, for its principal business is the making of rock candy for the ladies of the harem. They gave us a little to taste, but would not sell any except to Mrs S., the whole being wanted for the use of the ladies. There was also a distillery attached to the factory, under the direction of another Arab, who gave satisfactory evidence, in his own person at least, of the strength of the spirit made, being more than two-thirds drunk.

The same evening we came to at Beni Hassan, and the next morning lauded to visit the tombs. Like all the tombs in Egypt, except those of the kings at Thebes, they are excavated in the sides of the mountain, commanding an extensive view of the valley of the Nile; but in one respect they are different from all others in Egypt. The doors have regular Doric columns, and they are the only specimens of architecture in Egypt which at all approximate to the Grecian style. This would not be at all extraordinary if they were constructed after the invasion of Alexander and the settlement of the Greeks in the country, but it is ascertained that they were built long before that time; and, indeed, it is alleged by antiquaries that these tombs and the obelisk at Heliopolis are the oldest monuments in Egypt. The interiors are large and handsomely proportioned (one of them being sixty feet square and forty feet high), and adorned with paintings, representing principally scenes of domestic life. Among them Mr S. and myself made out one, which is constantly to be seen at the present day, namely, a half-naked Egyptian, with a skin of water across his back, precisely like the modern Arab in the streets of Cairo.

We returned to our boat, and, being now within two days of Cairo, and having different places to stop at below, after dinner I said farewell to my kind friends, and returned to my own boat. My crew received me with three cheers, I was going to say, but they do not understand or practise that noisy mode of civilised welcome, and gave me the grave and quiet salutation of their country, all rising as soon as I touched the deck, and one after the other taking my hand in his, and touching it to his forehead and lips. My poor rais gave me a melancholy greeting. He had been unwell during the whole voyage, but since we parted had been growing worse. He told me that our stars were the same, and that misfortune had happened to us both as soon as we separated. I could but hope that our stars were not inseparably connected, for I looked upon him as a doomed man. I had saved him at Cairo from being pressed into the pacha's service; and again in descending, when he stopped at Kenneh, he and his whole crew had been seized in the bazaars, and, in spite of their protestations that they were in the service of an American, the iron bonds were put around their wrists and the iron collars round their necks. The governor afterwards rode down to the river, and the American flag streaming from the masthead of my little boat procured their speedy release, and saved them from the miserable fate of Arab soldiers.

Under all the oppressions of the pacha's government, there is nothing more grinding than this. The governor of a town, or the sheik of a village, is ordered to furnish so many men as soldiers. He frequently has a leaning towards his own subjects or followers, and is disposed to save them if he can; and if any unlucky stranger happens to pass before the complement is made up, he is inevitably pounced upon as one of the required number. It is useless for the poor captive to complain that he is a stranger, and that the rights of hospitality are violated; he appeals to those who are interested in tightening his bonds; and when he is transferred to the higher authorities, they neither know nor care who he is or whence he comes. He has the thews and sinews of a man, and though his heartstrings be cracking, he

can bear a musket, and that is enough. For centuries Egypt has been overrun by strangers, and the foot of a tyrant has been upon the necks of her inhabitants; but I do not believe that, since the days of the Pharaohs, there has been on the throne of Egypt so thorough a despot as the present pacha.

But to return to my rais. His first request was for medicine, which, unfortunately, I could not give him. The Arabs have a perfect passion for medicine. Early in our voyage my crew had discovered that I had some on board, and one or another of them was constantly sick until they had got it all; and then they all got well except the rais; and for him I feared there was no cure.

On the eleventh, early in the morning, Paul burst into the cabin, cursing all manner of Arabs, snatched the gun from over my head, and was out again in a moment. I knew there was no danger when Paul was so valorous; and, opening my broken shutter, I saw one of my men struggling with an Arab on shore, the latter holding him by the throat with a pistol at his head. The rascal had gone on shore just at daylight to steal wood, and while in the act of tearing down a little fence, the watchful owner had sprung upon him, and seemed on the point of correcting for ever all his bad habits. His fellows ran to the rescue, with Paul at their head; and the culprit, relieved from the giant grasp of his adversary, quietly sneaked on board, and we resumed our progress.

In the course of my last day on the Nile, I visited one of the greatest of its ruined cities, and for moral effect, for powerful impression on the imagination and feelings, perhaps the most interesting of them all. So absolute, complete, and total is the ruin of this once powerful city, that antiquaries have disputed whether there is really a single monument to show where the great Memphis stood; but the weight of authority seems to be, that its stately temples and palaces, and its thousands of inhabitants, once covered the ground now occupied by the little Arab village of Metrahenny. This village stands about four miles from the river; and the traveller might pass through it and around it, without ever dreaming that it had once been the site of a mighty city. He might, indeed, as he wandered around the miserable village, find, half buried in the earth, the broken fragments of a colossal statue; and, looking from the shattered relic to the half-savage Arabs around him, he might say to himself, "This is the work of other men and other times, and how comes it here?" But it would never occur to him that this was the last remaining monument of one of the greatest cities in the world. He might stop and gaze upon the huge mounds of ruins piled among the groves of palm, and ask himself, "Whence, too, came these?" But he would receive no answer that could satisfy him. In a curious and unsatisfied mood, he would stroll on through the village, and from the other extremity would see on the mountains towering before him, on the edge of the desert, a long range of pyramids and tombs, some crumbling in ruin, others upright and unbroken as when they were reared, and all stretching away for miles, one vast necropolis; his reason and reflection would tell him that, where are the chambers of the dead, there must also have been the abodes of the living; and with wonder he would ask himself, "Where is the mighty city whose inhabitants now sleep in yonder tombs? Here are the proud graves in which they were buried; where are the palaces in which they revelled, and the temples in which they worshipped?" And he returns to the broken statue and the mounds of ruins, with the assurance that they are the sad remnants of a city once among the proudest in the world.

My movements in Egypt were too hurried, my means of observation and my stock of knowledge too limited, to enable me to speculate advisedly upon the mystery which overhangs the history of her ruined cities; but I always endeavoured to come to some decision of my own, from the labours, the speculations, and the conflicting opinions of others. An expression which I had seen referred to in one of the books, as being the only

one in the Bible in which Memphis was mentioned by name, was uppermost in my mind while I was wandering over its site—"And Memphis shall bury them." There must be, I thought, some special meaning in this expression; some allusion to the manner in which the dead were buried at Memphis, or to a cemetery or tombs different from those which existed in other cities of its day. It seems almost impossible to believe that a city, having for its burying-place the immense tombs and pyramids which even yet for many miles skirt the borders of the desert, can ever have stood upon the site of this miserable village; but the evidence is irresistible.

The plain on which this ancient city stood is one of the richest on the Nile, and herds of cattle are still seen grazing upon it, as in the days of the Pharaohs. The pyramids of Sacchara stand on the edge of the desert, a little south of the site of Memphis. If it was not for their mightier neighbours, these pyramids, which are comparatively seldom honoured with a visit, would alone be deemed worthy of a pilgrimage to Egypt. The first to which we came is about 350 feet high, and 700 feet square at its base. The door is on the north side, 180 feet from the base. The entrance is by a beautifully polished shaft, 200 feet long, and inclining at an angle of about ten degrees. We descended till we found the passage choked up with huge stones. I was very anxious to see the interior, as there is a chamber within said to resemble the tomb of Agamemnon at Mycene; and having once made an interesting visit to that tomb of the king of kings, I wished to compare them; but it was excessively close, the sweat was pouring from us in streams, and we were suffocating with heat and dust. We came out and attempted to clamber up the side from the door to the top, but found it so difficult that we abandoned the effort, although Paul afterwards mounted, with great ease, by one of the corners. While I was walking round the base, I heard a loud scream from that courageous dragoon, and saw him standing about half way up, the picture of terror, staring at a wild boar that was running away, if possible, more frightened than himself. It was a mystery to me what the animal could be doing there, unless he went up on purpose to frighten Paul. After he got over his fright, however, the boar was a great acquisition to him, for I always had great difficulty in getting him into any tomb or other place of the kind without a guide; and whenever I urged him to enter a pyramid or excavation of any kind, he always threw the wild boar in my teeth, whose den, he was sure to say, was somewhere within.

There are several pyramids in this vicinity; among others, one which is called the brick pyramid, and which has crumbled so gradually and uniformly that it now appears only a huge misshapen mass of brick, somewhat resembling a bee-hive. Its ruins speak a moral lesson. Herodotus says that this fallen pyramid was built by King Asyehis, and contained on a piece of marble the vain-glorious inscription—"Do not disparage my worth by comparing me to those pyramids composed of stone; I am as much superior to them as Jove is to the rest of the deities."

Retracing my steps, I continued along the edge of the mountain, which every where showed the marks of having been once lined with pyramids and tombs. I was seeking for one of the most curious and interesting objects that exist in Egypt—not so interesting in itself, as illustrating the character of the ancient inhabitants and their superstitions—I mean the burial-place of the sacred birds. Before we reached it, my Arab guide pointed to a pyramid on our left, saying that it contained a remarkable chamber, so high that a stone hurled with a man's utmost strength could not reach the top. As this pyramid was not mentioned in my guide-book, and I had no hope in a country so trodden as Egypt now is, to become a discoverer of new wonders, I at first paid no attention to him; but he continued urging me to visit the lofty chamber; and at last, telling him that if I did not find it as he said, I would not give him a para of bucksheesh, I consented. There was no door to the pyramid; but, about 100 feet from its base, on the north

side, was a square excavation or shaft about 40 feet deep, at the end of which was a little hole not more than large enough to admit a man's arm. The Arab scooped out the sand, and with his hands and feet worked his meagre body through, and I followed on my back, feet foremost. Though not particularly bulky, I wanted more room than the Arab, and my shoulders stuck fast. I was trying to work out again, when he grasped me by the heels, and began pulling me in with all his might; but, luckily, I had play for my legs, and, drawing them up, I gave him a kick with my heavy boots that kept him from taking hold again until I had time to scramble out.

While Paul and the Arab were enlarging the hole below, the top of the pit was darkened, and, looking up, I saw two young Englishmen with whom I had dined a few days before, while coming down the river with Mr S. and his lady. They had seen my boat, and come to join me, and I was very glad to see them; for though I had no actual apprehension of the thing, yet it occurred to me that it would be very easy for my Arab friends to roll a stone against the hole, and shut me in for ever. It would have been something to be buried in a pyramid, to be sure; but even the belief that it was the tomb of a king would hardly compensate for the inconvenience of being buried alive. We left their servant, a strapping Greek, at the door, and the Arab having enlarged the hole, we went to work systematically, laid ourselves upon our backs, and, being prepared beforehand, were dragged in by the heels. The narrow part of the hole was not more than half the length of the body, and once past this, there was more room to move about than in any other of the pyramids; we could walk without stooping. Descending some hundred feet through an inclined passage excavated in the rock, with doors opening from it at regular intervals, we came to the large chamber of which the Arab had spoken. As in all the pyramids and tombs, the interior was in perfect darkness, and the feeble light of our torches gave us but an imperfect view of the apartment. The Arab immediately commenced his experiment with the stone; we could hear the whizzing as it cut through the empty space, and, after what seemed a very long time, the sound of its fall upon the rocky floor. At some distance up we could distinguish a door, and sending one of the Arabs up to it, by the flaring light of his torch, held as high as he could reach, we thought, but we were not certain, that we could make out the ceiling.

From hence it was but a short distance to the catacombs of birds; a small opening in the side of a rock leads to an excavated chamber, in the centre of which is a square pit or well. Descending the pit by bracing our arms, and putting our toes in little holes in the side, we reached the bottom, where, crawling on our hands and knees, we were among the mummies of the sacred ibis, the embalmed deities of the Egyptians. The extent of these catacombs is unknown, but they are supposed to occupy an area of many miles. The birds are preserved in stone jars, piled one upon another as closely as they can be stowed. By the light of our torches, sometimes almost flat upon our faces, we groped and crawled along the passages, lined on each side with rows of jars, until we found ourselves again and again stopped by an impenetrable phalanx of the little mummies, or rather of the jars containing them. Once we reached a small open space where we had room to turn ourselves; and knocking together two of the vessels, the offended deities within sent forth volumes of dust which almost suffocated us. The bird was still entire, in form and lineament perfect as the mummied man, and like him, too, wanting merely the breath of life. The Arabs brought out with them several jars, which we broke and examined above ground, more at our ease. With the pyramids towering around us, it was almost impossible to believe that the men who had raised such mighty structures had fallen down and worshipped the puny birds whose skeletons we were now dashing at our feet.

My last work was now done, and I had seen my last sight on the Nile. Leaving behind me for ever the pyramids of Egypt, and the mountains and sands of the

Libyan Desert, I rode along the valley, among villages and groves of palm-trees, and a little before dark arrived at Ghizeh. My boat was there; I went on board for the last time; my men took to their oars, and in half an hour we were at Boulac. It was dark when we arrived, and I jumped on shore searching for a donkey, but none was to be had. I was almost tired out with the labours of the day, but Paul and I set off, nevertheless, on foot for Cairo. We were obliged to walk smartly, too, as the gate closed at nine o'clock; but when about half way there, we met an Arab with a donkey, cheering the stillness of the evening with a song. An extravagant price (I believe it was something like eighteen and three quarter cents) bribed him to dismount, and I galloped on to Cairo, while Paul retraced his steps to the boat. The reader may judge how completely "turned up" must have been the feelings of a quiet citizen of New York, when told that, in winding at night through the narrow streets of Grand Cairo, the citizen aforesaid felt himself quite at home; and that the greeting of Francisco, the garçon at the Locanda d'Italia, seemed the welcome of an old friend. Hoping to receive letters from home, I went immediately to the American consul, and was disappointed; there were no letters, but there was other and interesting news for me; and as an American, identified with the honour of my country, I was congratulated there, thousands of miles from home, upon the expected speedy and honourable termination of our difficulties with France. An English vessel had arrived at Alexandria, bringing a London paper containing the president's last message, a notice of the offer of mediation from the English government, its acceptance by France, and the general impression that the quarrel might be considered settled and the money paid. A man must be long and far from home to feel how dearly he loves his country, how his eye brightens and his heart beats when he hears her praises from the lips of strangers; and when the paper was given me, with congratulations and compliments on the successful and honourable issue of the affair with France, my feelings grew prouder and prouder as I read, until, when I had finished the last line, I threw up my cap in the old city of Cairo, and shouted the old gathering cry, "Hurrah for Jackson!"

I have heard all manners of opinion expressed in regard to a voyage on the Nile, and may be allowed, perhaps, to give my own. Mrs S. used frequently to say, that although she had travelled in France, Switzerland, Germany, Italy, and Sicily, she had never enjoyed a journey so much before, and was always afraid that it would end too soon. Another lady's sentiments, expressed in my hearing, were just the contrary. For myself, being alone, and not in very good health, I had some heavy moments; but I have no hesitation in saying that, with a friend, a good boat well fitted up, books, guns, plenty of time, and a cook like Michel, a voyage on the Nile would exceed any travelling within my experience. The perfect freedom from all restraint, and from the conventional trammels of civilised society, forms an episode in a man's life that is vastly agreeable and exciting. Think of not shaving for two months, of washing your shirts in the Nile, and wearing them without being ironed. True, these things are not absolutely necessary; but who would go to Egypt to travel as he does in Europe? "Away with all fantasies and fetters," is the motto of the tourist. We throw aside pretty much every thing except our pantaloons; and a generous rivalry in long beards and soiled linen is kept up with exceeding spirit. You may go ashore whenever you like, and stroll through the little villages, and be stared at by the Arabs, or walk along the banks of the river till darkness covers the earth; shooting pigeons, and sometimes pheasants and hares, besides the odd shots from the deck of your boat at geese, crocodiles, and pelicans. And then it is so ridiculously cheap an amusement. You get your boat with ten men for thirty or forty dollars a-month, fowls for three piastres (about a shilling) a-pair, a sheep for half or three quarters of a dollar, and eggs almost for the asking. You sail under

your own country's banner; and when you walk along the river, if the Arabs look particularly black and truculent, you proudly feel that there is safety in its folds. From time to time you hear that a French or English flag has passed so many days before you, and you meet your fellow-voyagers with a freedom and cordiality which exist nowhere but on the Nile.

These are the little every-day items in the voyage, without referring to the great and interesting objects which are the traveller's principal inducements and rewards—the ruined cities on its banks, the mighty temples and tombs, and all the wonderful monuments of Egypt's departed greatness. Of them I will barely say, that their great antiquity, the mystery that overhangs them, and their extraordinary preservation amid the surrounding desolation, make Egypt perhaps the most interesting country in the world. In the words of an old traveller, "Time sadly overcometh all things, and is now dominant, and sitteth upon a sphinx and looketh into Memphis and old Thebes, while his sister Oblivion reclines semi-somnolent on a pyramid, gloriously triumphing and turning old glories into dreams. History sinketh beneath her cloud. The traveller as he passeth amazedly through those deserts, asketh of her who builded them, and she mumbleth something, but what it is he heareth not."

It is now more than 3000 years since the curse went forth against the land of Egypt. The Assyrian, the Persian, the Greek, the Roman, the Arabian, the Georgian, the Circassian, and the Ottoman Turk, have successively trodden it down and trampled upon it; for thirty centuries the foot of a stranger has been upon the necks of her inhabitants; and in bidding farewell to this once favoured land, now lying in the most abject degradation and misery, groaning under the iron rod of a tyrant and a stranger, I cannot help recurring to the inspired words, the doom of prophecy—"It shall be the basest of the kingdoms, neither shall it exalt itself any more among the nations; and there shall be no more a prince of the land of Egypt."

### CHAPTER XIII.

A good Word for the Arabs.—A Prophecy fulfilled.—Ruins of a Lost City.—A Sheikh of the Bedouins.—Interviews and Negotiations.—A Hadj, or Pilgrimage to Mecca.—Mahomedan Heaven for Wives.—A French Sheikh.—The Bastinado.—Departure for the Desert.

I HAD now finished my journey in Egypt, from the Mediterranean to the Cataracts, or, as the boundaries of this ancient country are given in the Bible, from "Migdol to Syene, even unto the borders of Ethiopia." For nearly two months I had been floating on the celebrated river, with a dozen Arabs, prompt to do my slightest bidding, and, in spite of bugs and all manner of creeping things, enjoying pleasures and comforts that are not to be found in Europe; and it was with something more than an ordinary feeling of regret that I parted from my worthy boatmen. I know that it is the custom with many travellers to rail at the Arabs, and perhaps to beat them, and have them bastinadoed; but I could not and cannot join in such oppression of this poor and much abused people. On the contrary, I do not hesitate to say that I always found them kind, honest, and faithful, thankful for the smallest favour, never surly or discontented, and always ready and anxious to serve me with a zeal that I have not met in any other people; and when they came up in a body to the locanda to say farewell, I felt that I was parting with tried and trusty friends, most probably for ever. That such was the case with the rais, there could be little doubt; he seemed to look upon himself as a doomed man, and a broken cough, a sunken eye, and a hollow cheek, proclaimed him one fast hurrying to the grave.

I was now about wandering amid new and different scenes. I was about to cross the dreary waste of sand, to exchange my quiet, easy-going boat for a caravan of dromedaries and camels; to pitch my tent wherever the setting sun might find me, and, instead of my gentle

Arabs of the Nile, to have for my companions the wild, rude Bedouins of the desert; to follow the wandering footsteps of the children of Israel when they took up the bones of Joseph, and fled before the anger of Pharaoh, from their land of bondage; to visit the holy mountain of Sinai, where the Almighty, by the hands of his servant Moses, delivered the tables of his law to his chosen people.

But I had in view something beyond the holy mountain. My object was to go from thence to the Holy Land. If I should return to Suez, and thence cross the desert to El Arich and Gaza, I should be subjected to a quarantine of fourteen days on account of the plague in Egypt; and I thought I might avoid this by striking directly through the heart of the desert from Mount Sinai to the frontier of the Holy Land. There were difficulties and perhaps dangers on this route; but besides the advantage of escaping the quarantine, another consideration presented itself, which, in the end, I found it impossible to resist. This route was entirely new. It lay through the land of Edom—a land that occupies a large space on the pages of the Bible; Edom denounced by God himself, once given to Esau for his inheritance, "as being of the fatness of the earth," but now a desolate monument of the divine wrath, and a fearful witness to the truth of the words spoken by his prophets. The English friends with whom I had dined at Thebes first suggested to me this route, referring me, at the same time, to Keith on the Prophecies, in which, after showing with great clearness and force the fulfilment of prophecy after prophecy, as illustrated by the writings and reports of travellers, the learned divine enlarges upon the prophecy of Isaiah against the land of Idumea, "None shall pass through it for ever and ever;" and proves, by abundant references to the works of modern travellers, that though several have crossed its borders, none have ever passed through it. Burckhardt, he says, made the nearest approach to this achievement; but by reference to the geographical boundaries, he maintains that Burckhardt did not pass through the land of Edom; and so strenuously does the learned divine insist upon the fulfilment of the prophecy to its utmost extent, as to contend that, if Burckhardt did pass through the land of Edom, he died in consequence of the hardships he suffered on that journey. I did not mean to brave a prophecy. I had already learned to regard the words of the inspired penmen with an interest I never felt before; and with the evidence I had already had of the sure fulfilment of their predictions, I should have considered it daring and impious to place myself in the way of a still impending curse. But I did not go so far as the learned commentator, and to me the words of the prophet seemed sufficiently verified in the total breaking up of the route then travelled, as the great highway from Jerusalem to the Red Sea and India, and the general and probably eternal desolation that reigns in Edom.

Still, however, it added to the interest with which I looked upon this route; and, moreover, in this dreary and desolate region, for more than a thousand years buried from the eyes of mankind, its place unknown, and its very name almost forgotten, lay the long lost city of Petra, the capital of Arabia Petrea, and the Edom of the Edomites, containing, according to the reports of the only travellers who have ever been permitted to enter it, the most curious and wonderful remains existing in the world: a city excavated from the solid rock, with long ranges of dwellings, temples, and tombs, cut in the sides of the mountain, and all lying in ruins; "thorns coming up in her palaces, nettles and brambles in the fortresses thereof, a habitation of dragons, and a court for owls." Three parties had at different times visited Petra, but neither of them had passed through the land of Idumea; and, according to the reports of the few travellers who had crossed its borders, the Bedouins who roamed over the dreary sands of Idumea were the most ferocious tribe of the desert race. It will not be considered surprising, therefore, that, having once conceived the project, I was will-

ing to fulfil it even at the cost of some personal difficulty and hazard.

I have said that this route was entirely new. It was known that two Englishmen, with an Italian, long resident in Egypt, and understanding thoroughly the language and character of the Arabs, had started from Cairo about a year before to make this journey, and, as they had been heard of afterwards in Europe, it was known that they had succeeded; but no account of their journey had ever been published, and all the intelligence I could obtain of the route and its perils was doubtful and confused. The general remark was, that the undertaking was dangerous, and that I had better let it alone. Almost the only person who encouraged me was Mr Gliddon, our vice-consul; and, probably, if it had not been for him, I should have given up the idea. Besides the difficulties of the road, there were others of a more personal nature. I was alone. I could not speak the language, and I had with me a servant, who, instead of leading me on, and sustaining me when I faltered, was constantly torturing himself with idle fears, and was very reluctant to accompany me at all. Nor was this all; my health was far from being restored, and my friend Waghorn was telling me every day, with a warning voice, to turn my steps westward; but objections presented themselves in vain; and perhaps it was precisely because of the objections that I finally determined upon attempting the journey through the land of Idumea.

By singular good fortune, the sheik of Akaba was then at Cairo. The great yearly caravan of pilgrims for Mecca was assembling outside the walls, and he was there, on the summons of the pacha, to escort and protect them through the desert as far as Akaba. He was the chief of a powerful tribe of Bedouins somewhat reduced by long and bloody wars with other tribes, but still maintaining, in all its vigour, the wild independence of the race, and yet strong enough to set at defiance even the powerful arm of the pacha. A system of mutual forbearance seemed to exist between them, the Bedouins knowing that, although the pacha might not subdue them, his long arm could reach and disturb them even in their sandy hills; while the pacha could not overlook the fact that the effort would cost him the lives of his best troops, and that the plunder of their miserable tents would bring him neither glory nor profit. Thus the desert was still the possession of the Bedouins; they still claimed a tribute from the stranger for permission to pass over it; and this induced the pacha annually to invite the sheik of Akaba to Cairo, to conduct the caravan for Mecca, knowing that if not so invited, even the sacred character of the pilgrims would not protect them in passing through his country.

I found him about a mile outside the walls near the tombs of the califs, on the edge of the desert, sitting on a mat under his tent, and surrounded by a dozen of his swarthy tribe, armed with long sabres, pistols, and matchlock guns. The sheik was a short stout man, of the darkest shade of bronze; his eye keen, roving, and unsettled; his teeth white; and his skin so dried up and withered that it seemed cleaving to his very bones. At the first glance, I did not like his face; it wanted frankness, and even boldness; and I thought at the time, that if I had met him alone in the desert, I should not have trusted him. He received me with great civility, while his companions rose, gave me their low salaam, seated me on the mat beside him, and then resumed their own cross-legged attitude, with less noise than would have attended the entrance of a gentleman into a drawing-room on a morning call. All stared at me with silent gravity; and the sheik, though desert born and bred, with an air and manner that showed him familiar with the usages of good society in Cairo, took the pipe from his mouth and handed it to me.

All being seated, the consul's janizary, who had come with me, opened the divan; but he had scarcely begun to declare my object before the whole group, sheik and all, apparently surprised out of their habitual phlegm, cried out together that they were ready to escort me,

and to defend me with their lives against every danger. I said a few words, and they became clamorous in their assurances of the great friendship they had conceived for me; that life was nothing in my service; that they would sleep in my tent, guard and watch me by day and night, and, in short, that they would be my father, mother, sister, and brother, and all my relations, in the desert; and the final assurance was, that it would not be possible to travel that road except under their protection. I then began to inquire the terms, when, as before, all spoke at once; some fixed one price, some another, and for bucksheesh whatever I pleased. I did not like this wild and noisy negotiation. I knew that I must make great allowance for the extravagant language of the Arabs; but there seemed to be an eagerness to get me among them, which, in my eyes, was rather ominous of bad intentions. They were known to be a lawless people, and distinguished, even among their desert brethren, as a wild and savage tribe. And these were the people with whom I was negotiating to meet in the desert, at the little fortress of Akaba, at the eastern extremity of the Red Sea; into whose hands I was to place myself, and from whom I was to expect protection against greater dangers.

My interview with them was not very satisfactory, and, wishing to talk the matter over more quietly with the sheik alone, I asked him to go with me to my hotel; whereupon the whole group started up at once, and, some on foot, and others on dromedaries or on horseback, prepared to follow. This did not suit me, and the sheik contrived to get rid of all except one, his principal and constant attendant, "his black," as he was called. He followed me on horseback; and when he came up into my room, it was, perhaps, the first time in his life that he had ever been under a roof. As an instance of his simplicity and ignorance, it may be worth mentioning here, although I did not know it until we were on the point of separating after our journey was completed, that he mistook the consul's janizary, who wore a dashing red Turkish dress, sword, &c., for an officer of the pacha's household, and, consequently, had always looked upon me as specially recommended to him by the pacha. I could not come to any definite understanding with him. The precise service that I required of him was to conduct me from Akaba to Hebron, through the land of Edom, diverging to visit the excavated city of Petra, a journey of about ten days. I could not get him to name any sum as compensation for this service; he told me that he would conduct me for nothing, that I might give him what I pleased, &c. When I first spoke about the terms at his tent, he had said twelve dollars a camel, and, as it seemed to me, he had named this sum without the least calculation, as the first that happened to occur to him. I now referred him to this price, which he had probably forgotten, hoping to establish it as a sort of basis upon which to negotiate; but when his attention was called to it, he insisted upon the twelve dollars, and something more for bucksheesh. A fair price for this service would have been about two dollars. I told him this did not satisfy me; that I wanted every thing definitely arranged beforehand, and that I would not give the enormous price he asked, and bucksheesh in proportion; but I could do nothing with him: he listened with perfect coolness; and taking his pipe from his mouth, in answer to every thing I said, told me to come to him at Akaba, come to him at his tent; he had plenty of camels, and would conduct me without any reward, or I might give him what I pleased. We parted without coming to an arrangement. He offered to send one of his men to conduct me from Mount Sinai to Akaba; but as something might occur to prevent my going, I would not take him. He gave me, however, his signet, which he told me every Bedouin on that route knew and would respect, and writing his name under it according to the sound, I repeated it over and over, until I could pronounce it intelligibly, and treasured it up as a password for the desert.

The next morning, under pretence that I went to see the starting of the great caravan of pilgrims for Mecca,

I rode out to the sheik; and telling him that, if I came to him, I should come destitute of every thing, and he must have some good tobacco for me, I slipped a couple of gold pieces into his hand, and, without any further remark, left the question of my going undetermined. It was worth my ride to see the departure of the caravan. It consisted of more than 30,000 pilgrims, who had come from the shores of the Caspian, the extremities of Persia, and the confines of Africa; and having assembled, according to usage for hundreds of years, at Cairo as a central point, the whole mass was getting in motion for a pilgrimage of fifty days, through dreary sands, to the tomb of the Prophet.

Accustomed as I was to associate the idea of order and decorum with the observance of all rites and duties of religion, I could not but feel surprised at the noise, tumult, and confusion, the strifes and battles, of these pilgrim-travellers. If I had met them in the desert after their line of march was formed, it would have been an imposing spectacle, and comparatively easy to describe; but here, as far as the eye could reach, they were scattered over the sandy plain; 30,000 people, with probably 20,000 camels and dromedaries, men, women, and children, beasts and baggage, all commingled in a confused mass that seemed hopelessly inextricable. Some had not yet struck their tents, some were making coffee, some smoking, some cooking, some eating, many shouting and cursing, others on their knees praying, and others, again, hurrying on to join the long moving stream that already extended several miles into the desert.

It is a vulgar prejudice the belief that women are not admitted into the heaven of Mahommed. It is true that the cunning Prophet, in order not to disturb the joyful serenity with which his followers look forward to their promised heaven, has not given to women any fixed position there, and the pious Mussulman, although blessed with the lawful complement of four wives, is not bound to see among his seventy-two black-eyed hours the faces of his companions upon earth; but the women are not utterly cast out; they are deemed to have souls, and entitled to a heaven of their own; and it may be, too, that their visions of futurity are not less bright, for that there is a mystery to be unravelled beyond the grave, and they are not doomed to eternal companionship with their earthly lords. In the wildest, rudest scene where woman appears at all, there is a sweet and undefinable charm; and their appearance among the pilgrims, the care with which they shrouded themselves from every eye, their long thick veils, and their tents or four-post beds, with curtains of red silk, fastened down all around and secured on the high backs of camels, were the most striking objects in the caravan. Next to them in interest were the miserable figures of the marabouts, santons, or Arab saints, having only a scanty covering of rags over their shoulders, and the rest of their bodies completely naked, yet strutting about as if clothed in purple and fine linen; and setting off utterly destitute of every thing, for a journey of months across the desert, safely trusting to that open-handed charity which forms so conspicuous an item in the list of Mussulman virtues. But the object of universal interest was the great box containing the presents and decorations for the tomb of the Prophet. The camel which bears this sacred burden is adorned with banners and rich housings, is watched and tended with pious care, and when his journey is ended, no meaner load can touch his back; he has filled the measure of a camel's glory, and lives and dies respected by all good Mussulmans.

In the evening, being the last of my stay in Cairo, I heard that Mr Linant, the companion of M. Laborde on his visit to Petra, had arrived at Alexandria, and, with Mr Gliddon, went to see him. Mr L. is one of the many French emigrés driven from their native soil by political convulsions, and who have risen to distinction in foreign lands by military talents, and the force of that restless energy so peculiar to his countrymen. Many years before, he had thrown himself into the Arabian Desert, where he had become so much beloved by the Bedouins, that on the occasion of a dispute between two contend-

ing claimants, the customs of their tribe were waived, the pretensions of the rivals set aside, and he was elected sheik of Mount Sinai, and invested with the flattering name, which he retains to this day, of Abdel Hag, or the slave of truth. Notwithstanding his desert rank and dignity, he received me with a politeness which savoured of the salons of Paris, and encouraged me in my intention of visiting Petra, assuring me that it would abundantly repay me for all the difficulties attending it; in fact, he spoke lightly of these, although I afterwards found that his acquaintance with the language, his high standing among the Bedouins, and his lavish distribution of money and presents, had removed or diminished obstacles which, to a stranger without these advantages, were by no means of a trifling nature. In addition to much general advice, he counselled me particularly to wear the Turkish or Arab dress, and to get a letter from the Habeeb Effendi to the governor of the little fortress of Akaba. Mr Linant has been twenty years in Egypt, and is now a bey in the pacha's service; and that very afternoon, after a long interview, had received orders from the great reformer to make a survey of the pyramids, for the purpose of deciding which of those gigantic monuments, after having been respected by all preceding tyrants for 3000 years, should now be demolished for the illustrious object of yielding material for a petty fortress, or scarcely more useful and important bridge.

Early in the morning I went into the bazaars, and fitted out Paul and myself with the necessary dresses. Paul was soon equipped with the common Arab dress, the blue cotton shirt, tarbouch, and Bedouin shoes. A native of Malta, he was very probably of Arab descent in part, and his dark complexion and long black beard would enable him readily to pass for one born under the sun of Egypt. As for myself, I could not look the swarthy Arab of the desert, and the dress of the Turkish houaja or gentleman, with the necessary arms and equipments, was very expensive; so I provided myself with the unpretending and respectable costume of a Cairo merchant; a long red silk gown, with a black abbas of camel's hair over it; red tarbouch, with a green and yellow striped handkerchief rolled round it as a turban; white trousers, large red shoes over yellow slippers, blue sash, sword, and a pair of large Turkish pistols.

Having finished my purchases in the bazaars, I returned to my hotel ready to set out, and found the dromedaries, camels, and guides, and expected to find the letter for the governor of Akaba, which, at the suggestion of Mr Linant, I had requested Mr Gliddon to procure for me. I now learned, however, from that gentleman, that, to avoid delay, it would be better to go myself, first sending my caravan outside the gate, and representing to the minister that I was actually waiting for the letter, in which case he would probably give it to me immediately. I accordingly sent Paul with my little caravan to wait for me at the tombs of the califs, and, attended by the consul's janizary, rode up to the citadel, and stopped at the door of the governor's palace.

The reader may remember that, on my first visit to his excellency, I saw a man whipped; this time I saw one bastinadoed. I had heard much of this, a punishment existing, I believe, only in the East, but I had never seen it inflicted before, and hope I never shall see it again. As on the former occasion, I found the little governor standing at one end of the large hall of entrance, munching, and trying causes. A crowd was gathered around, and before him was a poor Arab, pleading and beseeching most piteously, while the big tears were rolling down his cheeks; near him was a man whose resolute and somewhat angry expression marked him as the accuser, seeking vengeance rather than justice. Suddenly the governor made a gentle movement with his hand; all noise ceased; all stretched their necks and turned their eager eyes towards him; the accused cut short his crying, and stood with his mouth wide open, and his eyes fixed upon the governor. The latter spoke a few words in a very low voice, to me of course unintelligible, and, indeed, scarcely audible, but they seemed to fall upon the quick ears of the culprit like bolts of

thunder; the agony of suspense was over, and, without a word or look, he laid himself down on his face at the feet of the governor. A space was immediately cleared around; a man on each side took him by the hand, and, stretching out his arms, knelt upon and held them down, while another seated himself across his neck and shoulders. Thus nailed to the ground, the poor fellow, knowing that there was no chance of escape, threw up his feet from the knee-joint, so as to present the soles in a horizontal position. Two men came forward with a pair of long stout bars of wood, attached together by a cord, between which they placed the feet, drawing them together with the cord so as to fix them in their horizontal position, and leave the whole flat surface exposed to the full force of the blow. In the meantime two strong Turks were standing ready, one at each side, armed with long whips resembling our common cowskin, but longer and thicker, and made of the tough hide of the hippopotamus. While the occupation of the judge was suspended by these preparations, the janizary had presented the consul's letter. My sensibilities are not particularly acute, but they yielded in this instance. I had watched all the preliminary arrangements, nerv- ing myself for what was to come; but when I heard the scourge whizzing through the air, and, when the first blow fell upon the naked feet, saw the convulsive movements of the body, and heard the first loud piercing shriek, I could stand it no longer; I broke through the crowd, forgetting the governor and every thing else, except the agonising sounds from which I was escaping; but the janizary followed close at my heels, and, laying his hand upon my arm, hauled me back to the governor. If I had consulted merely the impulse of feeling, I should have consigned him, and the governor, and the whole nation of Turks, to the lower regions; but it was all-important not to offend this summary dispenser of justice, and I never made a greater sacrifice of feeling to expediency than when I re-entered his presence. The shrieks of the unhappy criminal were ringing through the chamber; but the governor received me with as calm a smile as if he had been sitting on his own divan, listening to the strains of some pleasant music, while I stood with my teeth clenched, and felt the hot breath of the victim, and heard the whizzing of the accursed whip, as it fell again and again upon his bleeding feet. I have heard men cry out in agony when the sea was raging, and the drowning man, rising for the last time upon the mountain waves, turned his imploring arms towards us, and with his dying breath called in vain for help; but I never heard such heart-rending sounds as those from the poor hastinadored wretch before me. I thought the governor would never make an end of reading the letter, when the scribe handed it to him for his signature, although it contained but half a dozen lines; he fumbled in his pocket for his seal, and dipped it in the ink; the impression did not suit him, and he made another; and, after a delay that seemed to me eternal, employed in folding it, handed it to me with a most gracious smile. I am sure I grinned horribly in return; and almost snatching the letter just as the last blow fell, I turned to hasten from the scene. The poor scourged wretch was silent; he had found relief in insensibility; I cast one look upon the senseless body, and saw the feet laid open in gashes, and the blood streaming down the legs. At that moment the bars were taken away, and the mangled feet fell like lead upon the floor. I had to work my way through the crowd, and before I could escape, I saw the poor fellow revive, and by the first natural impulse rise upon his feet, but fall again as if he had stepped upon red-hot irons. He crawled upon his hands and knees to the door of the hall, and here it was most grateful to see that the poor miserable, mangled, and degraded Arab, yet had friends whose hearts yearned towards him; they took him in their arms, and carried him away.

I was sick of Cairo, and in a right humour to bid farewell to cities, with all their artificial laws, their crimes and punishments, and all the varied shades of inhumanity from man to man, and in a few minutes I

was beyond the gate, and galloping away to join my companions in the desert. At the tombs of the califs I found Paul with my caravan; but I had not yet escaped the stormy passions of men. With the cries of the poor Arab still ringing in my ears, I was greeted with a furious quarrel, arising from the apportionment of the money I had paid my guides. I was in no humour to interfere, and, mounting my dromedary, and leaving Paul to arrange the affair with them as he best could, I rode on alone.

It was a journey of no ordinary interest on which I was now beginning my lonely way. I had travelled in Italy, among the mountains of Greece, the plains of Turkey, the wild steppes of Russia, and the plains of Poland, but neither of these afforded half the material for curious expectation that my journey through the desert promised. After an interval of 4000 years, I was about to pursue the devious path of the children of Israel, when they took up the bones of Joseph and fled before the anger of Pharaoh, among the mountain passes of Sinai, and through that great and terrible desert which shut them from the Land of Promise. I rode on in silence and alone for nearly two hours, and just as the sun was sinking behind the dark mountains of Mokkattam, halted to wait for my little caravan; and I pitched my tent for the first night in the desert, with the door opening to the distant land of Goshen.

#### CHAPTER XIV.

The Caravan.—Arab Political Economy.—A projected Railroad.—The Sirocco.—Suez.—A travelled Englishman.—The Red Sea.—Embarkation of Pilgrims.—A Misadventure.—Scriptural Localities.—The bitter Fountain.

THE arrangements for my journey as far as Mount Sinai had been made by Mr Gliddon. It was necessary to have as my guides some of the Bedouins from around the mountains, and he had procured one known to him, a man in whom I could place the most implicit confidence; and possessing another not less powerful recommendation, in the fact that he had been with Messrs Linant and Laborde to Petra. My caravan consisted of eight camels and dromedaries, and, as guide and camel-drivers, three young Bedouins from nineteen to twenty-two years old. My tent was the common tent of the Egyptian soldiers, bought at the government factory, easily carried, and as easily pitched; my bedding was a mattress and coverlet; and I had, moreover, a couple of boxes, about eighteen inches high, and the width of my mattress, filled with eatables, which I carried slung over the back of a camel, one upon each side, and at night, by the addition of two pieces of board, converted into a bedstead. My store of provisions consisted of bread, biscuit, rice, maccaroni, tea, coffee, dried apricots, oranges, a roasted leg of mutton, and two of the largest skins containing the filtered water of the Nile.

In the evening, while we were sitting around a fire, I inquired the cause of the quarrel from which I had escaped, and this led Toualeb into an explanation of some of the customs of the Bedouins. There exists among them that community of interest and property for which radicals and visionaries contend in civilised society. The property of the tribe is to a great extent common, and their earnings, or the profits of their labour, are shared among the whole. A Bedouin's wives are his own; and as the chastity of women is guarded by the most sanguinary laws, his children are generally his own; his tent, also, and one or two camels, are his, and the rest belongs to his tribe. The practical operation of this law is not attended with any great difficulty; for, in general, the *rest*, or that which belongs to the tribe, is nothing; there are no hoarded treasures, no coffers of wealth, the bequest of ancestors, or the gains of enterprise and industry, to excite the cupidity of the avaricious. Poor is the Bedouin born, and poor he dies, and his condition is more than usually prosperous when his poverty does not lead him to the shedding of blood.

I did not expect to learn lessons of political economy

among the Bedouin Arabs; but in the commencement of my journey with them, I found the embarrassment and evil of trammelling individual enterprise and industry. The consul had applied to Toualeb. Toualeb was obliged to propose the thing to such of his tribe as were then in Cairo, and all had a right to participate. The consequence was, that when we were ready to move, instead of five there were a dozen camels and dromedaries, and their several owners were the men whom I had left wrangling at the tombs of the califs; and even when it was ascertained that only five were wanted, still three supernumeraries were sent, that all might be engaged in the work. In countries where the labour of man and beast has a per diem value, the loss of the labour of three or four men and three or four camels would be counted; but in the East, time and labour have no value.

I do not mean to go into any dissertations on the character of the Bedouins, and shall merely refer to such traits as fell under my observation, and were developed by circumstances. While I was eating my evening meal, and talking with Toualeb, the three young camel-drivers sat at the door of the tent, leaning on their hands, and looking at me. I at first did not pay much attention to them, but it soon struck me as singular that they did not prepare their own meal; and, noticing them more attentively, I thought they were not looking so much at me as at the 'smoking pilau before me. I asked them why they did not eat their supper, and they told me that their masters had sent them away without a particle of any thing to eat. I was exceedingly vexed at this, inasmuch as it showed that I had four mouths to feed more than I had prepared for; no trifling matter on a journey in the desert, and one which Paul, as my quartermaster, said it was utterly impossible to accomplish. I at first told one of them to mount my dromedary and go back to Cairo, assuring him that, if he did not return before daylight, I would follow and have both him and his master bastinadoed; but before he had mounted, I changed my mind. I hated all returns and delays, and, smothering my wrath, told Paul to give them some rice and biscuit, at the risk of being obliged to come down to Arab bread myself. And so ended the first day of my journey.

Early in the morning we began our march, with our faces towards the rising sun. Before mid-day we were in as perfect a desert as if we were removed thousands of miles from the habitations of men; behind, before, and around us, was one wide expanse of level and arid sands, although we were as yet not more than eight hours from the crowded city of Cairo; and I might already cry out, in the spirit of Neikomm's famous cavatina, "The sea, the sea, the open sea!" Indeed, in all the travelling in the East nothing strikes one more forcibly than the quick transitions from the noise of cities to the stillness of the unpeopled waste.

It does, indeed, appear remarkable that, within so short a distance from Cairo, a city of so great antiquity and large population, and on a road which we know to have been travelled more than 4000 years, and which at this day is the principal route to the Red Sea, there is so little travelling. During the whole day we did not meet more than a dozen Arabs, with perhaps twenty or thirty camels. But a mighty change will soon be made in this particular. A railroad is about to be constructed across the desert, over the track followed by the children of Israel to the Red Sea. The pacha had already ordered iron from England for the purpose when I was in Egypt, and there is no doubt of its practicability, being only a distance of eighty miles over a dead level; but whether it will ever be finished, or whether, if finished, it will pay the expense, is much more questionable. Indeed, the better opinion is, that the pacha does it merely to bolster up his reputation in Europe as a reformer; that he has begun without calculating the costs; and that he will get tired and abandon it before it is half completed. It may be, however, that the reader will one day be hurried by a steam engine over the route which I was now crossing at the slow pace of a camel;

and when that day comes, all the excitement and wonder of a journey in the desert will be over. There will be no more pitching of tents, or sleeping under the starry firmament, surrounded by Arabs and camels; no more carrying provisions, and no danger of dying of thirst; all will be reduced to the systematic tameness of a cotton-factory, and the wild Arab will retire farther into the heart of the desert, shunning, like our native Indians, the faces of strangers, and following for ever the footsteps of his wandering ancestors. Blessed be my fortune, improvement had not yet actually begun its march.

In the course of the night I was suddenly awakened by a loud noise like the flapping of sails. A high wind had risen, and my tent not being well secured, it had turned over, so that the wind got under it and carried it away. In the civilised world, we often hear of reverses of fortune which reduce a man to such a state that he has not a roof to cover him; but few are ever deprived of the protection of their roof in so summary a way as this, and it is but fair to add that few have ever got it back so expeditiously. I opened my eyes upon the stars, and saw my house fleeing from me. Paul and I were on our feet in a moment, and gave chase, and with the assistance of our Arabs, brought it back and planted it again; I thought of the prudent Kentuckian who tied his house to a stump to keep it from being blown away, and would have done the same thing if I could have found a stump; but tree or stump in the desert there is none.

I was not disturbed again during the night; but the wind continued to increase, and towards morning and all the next day blew with great violence. It was the dread sirocco, the wind that has for ever continued to blow over the desert, carrying with it the fine particles of sand which, by the continued action of centuries, have buried the monuments, the temples, and the cities of Egypt; the sirocco, always disagreeable and dangerous, and sometimes, if the reports of travellers be true, suffocating and burying whole caravans of men and camels. Fortunately for me, it was blowing upon my back; but still it was necessary to draw my Arab cloak close over my head; and even then the particles of sand found their way within, so that my eyes were soon filled with them. This was very far from being one of the worst siroccos; but the sun was obscured, the atmosphere was a perfect cloud of sand, and the tracks were so completely obliterated, that a little after mid-day we were obliged to stop and take shelter under the lee of a hillock of sand; occasionally we had met caravans coming upon us through the thick clouds of sand, the Arabs riding with their backs to the heads of their camels, and their faces covered, so that not a single feature could be seen.

By the third morning the wind had somewhat abated, but the sand had become so scattered that not a single track could be seen. I was forcibly reminded of a circumstance related to me by Mr Waghorn. A short time before I met him at Cairo, in making a hurried march from Suez, with an Arab unaccustomed to the desert, he encamped about mid-way, and starting two hours before daylight, continued travelling, half asleep, upon his dromedary, until it happened to strike him that the sun had risen in the wrong place, and was then shining in his face instead of warming his back; he had been more than three hours retracing his steps to Suez. If I had been alone this morning, I might very easily have fallen into the same or a worse error. The prospect before me was precisely the same, turn which way I would; and if I had been left to myself, I might have wandered as long as the children of Israel in search of the Promised Land, before I should have arrived at the gate of Suez.

We soon came in sight of the principal, perhaps the only object, which a stranger would mark in the route from Cairo to Suez. It is a large palm-tree, standing alone about half way across, the only green and living thing on that expanse of barrenness. We saw it two or three hours; and moving with the slow pace of our camels, it seemed as if we should never reach it; and then, again, as if we should never leave it behind

us. A journey in the desert is so barren of incident, that wayfarers note the smallest circumstances, and our relative distance from the palm-tree, or half-way house, furnished occupation for a great part of the day.

At about twelve o'clock the next day we caught the first view of the Red Sea, rolling between the dark mountains of Egypt and Arabia, as in the days of Pharaoh and Moses. In an hour more we came in sight of Suez, a low dark spot on the shore, above the commencement of the chains of mountains on each side. About two hours before arriving, we passed, at a little distance on the left, a large khan, on the direct road to Akaba, built by the pacha as a stopping-place for the pilgrims on their way to Mecca. Three days before, more than 30,000 pilgrims had halted in and around it, but now not a living being was to be seen. About half an hour on the hither side of Suez we came to a well, where, for the first time since we left Cairo, we watered our camels.

Even among the miserable cities of Turkey and Egypt, few present so wretched an appearance as Suez. Standing on the borders of the desert, and on the shore of the sea, with bad and unwholesome water, not a blade of grass growing around it, and dependent upon Cairo for the food that supports its inhabitants, it sustains a poor existence by the trade of the great caravan for Mecca, and the small commerce between the ports of Cosseir, Djiddah, and Moeha. A new project has lately been attempted here, which, it might be supposed, would have a tendency to regenerate the fallen city. The route to India by the Red Sea is in the full tide of successful experiment; the English flag is often seen waving in the harbour, and about once in two months an English steamer arrives from Bombay; but even the clatter of a steam-boat is unable to infuse life into its sluggish population.

The gate was open, a single soldier was lying on a mat basking in the sun, his musket gleaming brightly by his side, and a single cannon projected over the wall, frowning with Tom Thumb greatness upon the stranger entering the city. Passing the gate, we found ourselves within a large open space crowded with pilgrims. Even the small space enclosed by the walls was not more than one quarter occupied by buildings, and these few were at the farthest extremity. The whole intermediate area was occupied by pilgrims, scattered about in every imaginable position and occupation, who stared at me as I passed among them in my European dress, and noticed me according to their various humours, some greeting me with a smile, some with a low and respectful salaam, and others with the black look and ferocious scowl of the bigoted and Frank-detesting Mussulmans.

We stopped in the square in front of the harbour, and inquired for an Englishman, the agent of Mr Waghorn, to whom I had a letter, and from whom I hoped to obtain a bed; but he had arrived only two days before, and I doubt whether he had one for himself. He did all he could for me, but that was very little. I remember one thing about him, which is characteristic of a class of European residents in Egypt; he had lived fourteen years between Alexandria and Cairo, and had never been in the desert before, and talked as if he had made a voyage to Babylon or Bagdad. He had provided himself with almost every thing that his English notions of comfort could suggest, and with these he talked of his three days' journey in the desert as a thing to be done but once in a man's life. I ought not to be harsh on him, however, for he was as kind as he could be to me, and in one thing I felt very sensibly the benefit of his kindness. By bad management, my water-skins, instead of being old and seasoned, were entirely new; the second day out the water was injured, and the third it was not drinkable. I did not suffer so much as Paul and the Arabs did, having fallen into the habit of drinking but little, and assuaging my thirst with an orange; but I suffered from a cause much worse; my eyes were badly inflamed, and the water was so much impregnated with the noxious absorption from the leather, that it destroyed the effect of the powders which I diluted

in it, and aggravated instead of relieving the inflammation. The Englishman had used kegs made for the purpose, and had more than a kegful left, which he insisted on my taking. One can hardly imagine that the giving or receiving a keg of water should be a matter of any moment; but, much as I wanted it, indeed, all-important as it was to me for the rest of my journey, I hesitated to deprive him of it. Before going, however, I filled one of my skins, and counted it at the time one of the most valuable presents I had ever received. He had been in the desert, too, the same day that we suffered from the sirocco, and his eyes were in a worse condition than mine.

The first thing he did was to find me a place to pass the night in. Directly opposite the open space was a large roquet or stone building, containing a ground and upper floor, and open in the centre, forming a hollow square. The whole building was divided by partitions into perhaps a hundred apartments, and every one of these and the open square outside were filled with pilgrims. The apartments consisted merely of a floor, roof, door, and walls, and sometimes one or the other of these requisites was wanting, and its deficiency supplied by the excess of another. My room was in one corner in the second story, and had a most unnecessary and uncomfortable proportion of windows; but I had no choice. I regretted that I had not pitched my tent outside the walls; but, calling to my assistance the ingenuity and contriving spirit of my country, fastened it up as a screen to keep the wind from coming upon me too severely, and walked out to see the little that was to be seen of Suez.

I had soon made a tour of the town; and having performed this duty, I hurried where my thoughts and feelings had long been carrying me, to the shore of the sea. Half a dozen vessels of some eighty or a hundred tons, sharp built, with tall spars for latteen sails, high poops, and strangely painted, resembling the ancient ships of war, or the Turkish corsair or Arab pirate of modern days, were riding at anchor in the harbour, waiting to take on board the thousands of pilgrims who were all around me. I followed the shore till I had turned the walls, and was entirely alone. I sat down under the wall, where I had an extensive view down the sea, and saw the place where the waters divided for the passage of the Israelites. Two hours I strolled along the shore, and when the sun was sinking behind the dark mountains of Mokattam, I was bathing my feet in the waters of the coral sea.

Early in the morning I went out on the balcony, and looking down into the open square, filled with groups of pilgrims, male and female, sleeping on the bare ground, in all manner of attitudes, I saw directly under me a dead Tartar. He had died during the night, his death-bed a single plank, and he was lying in the sheepskin dress which he wore when living. Two friends from the frozen regions of the north, companions in his long pilgrimage, were sitting on the ground preparing their morning coffee, and my Arabs were sleeping by his side, unconscious that but a few feet from them, during the stillness of the night, an immortal spirit had been called away. I gazed long and steadfastly upon the face of the dead Tartar, and moralised very solemnly — indeed, painfully — upon the imaginary incidents which my fancy summoned up in connection with his fate. Nor was the possibility of my own death, among strangers in a distant land, the least prominent or least saddening portion of my reverie.

I ascribe this unconformable moping-fit to my exposing myself before breakfast. The stomach must be fortified, or force, moral and physical, is gone, and melancholy and blue devils are the inevitable consequence. After breakfast I was another creature. My acute sensibility, my tender sympathies, were gone; and when I went out again, I looked upon the body of the dead Tartar with the utmost indifference.

The pilgrims were now nearly all stirring, and the square was all in motion. The balcony, and, indeed, every part of the old roquet, were filled with the better

class of pilgrims, principally Turks, the lords of the land; and in an apartment opening on the balcony, immediately next to mine, sat a beautiful Circassian, with the regular features and brilliant complexion of her country. By her side were two lovely children, fair and beautiful as their mother. Her face was completely uncovered, for she did not know that a stranger was gazing on her, and, turning from the black visages around him to her fair and lovely face, was revelling in recollections of the beauties of his native land. And lo, the virtue of a breakfast! I, that by looking upon a dead Tartar had buried myself in the deserts of Arabia, written my epitaph, and cried over my own grave, was now ready to break a lance with a Turk to rob him of his wife.

The balcony and staircase were thronged with pilgrims, many still asleep, so that I was obliged to step over their bodies in going down, and out of doors the case was much the same. At home I should have thought it a peculiarly interesting circumstance to join a caravan of Mussulmans on their pilgrimage to Mecca; but long before I had seen them start from the gate of Cairo, my feelings were essentially changed. I had hired my caravan for Mount Sinai; but feeling rather weak, and wishing to save myself six days' journey in the desert, I endeavoured to hire a boat to go down the Red Sea to Tor, supposed to be the Elim, or place of palm-trees, mentioned in the Exodus of the Israelites, and only two days' journey from Mount Sinai. The boats were all taken by the pilgrims, and these holy travellers were packed together as closely as sheep on board one of our North River sloops for the New York market. They were a filthy set, many of them probably not changing their clothes from the time they left their homes until they reached the tomb of the Prophet. I would rather not have travelled with them; but as it was my only way of going down the sea, I applied to an Arab to hire a certain portion of space on the deck of a boat for myself and servant; but he advised me not to think of such a thing. He told me if I hired and paid for such a space, the pilgrims would certainly encroach upon me; that they would beg, and borrow, and at last rob me; and, above all, that they were bigoted fanatics, and, if a storm occurred, would very likely throw me overboard. With this character of his brethren from a true believer, I abandoned the idea of going by sea, and that the more readily, as his account was perfectly consistent with what I had before heard of the pilgrims.

The scene itself did not sustain the high and holy character of a pilgrimage. As I said before, all were abominably filthy; some were sitting around a great dish of pilau, thrusting their hands in it up to the knuckles, squeezing the boiled rice, and throwing back their heads as they crammed the huge morsel down their throats; others packing up their merchandise, or carrying water-skins, or whetting their sabres; others wrangling for a few paras; and in one place was an Arab butcher, bare-legged, and naked from the waist upward, with his hands, breast, and face smeared with blood, leaning over the body of a slaughtered camel, brandishing an axe, and chopping off huge pieces of meat for the surrounding pilgrims. A little off from the shore a large party were embarking on board a small boat to go down to their vessel, which was lying at the mouth of the harbour; they were wading up to their middle, every one with something on his shoulders or above his head. Thirty or forty had already got on board, and as many more were trying to do the same; but the boat was already full. A loud wrangling commenced, succeeded by clenching, throttling, splashing in the water, and running to the shore. I saw bright swords gleaming in the air, heard the ominous click of a pistol, and in one moment more blood would have been shed, but for a Turkish aga, who had been watching the scene from the governor's balcony, and now dashing in among them with a huge silver-headed mace, and laying about him right and left, brought the turbulent pilgrims to a condition more suited to their sacred character.

At about nine o'clock I sent off my camels to go round

the head of the gulf, intending to cross over in a boat and meet them. At the moment they left the roquet, two friends were holding up a quilt before the body of the dead Tartar, while a third was within, washing and preparing it for burial. At twelve o'clock I got on board my boat; she was, like the others, sharp built, with a high poop and tall lateen sails, and, for the first time in all my travelling, I began to think a voyage better than a journey. In addition to the greater ease and pleasantness, there was something new and exciting in the passage of the Red Sea; and we had hardly given our large lateen sails to the wind, before I began to talk with the rais about carrying me down to Tor; but he told me the boat was too small for such a voyage, and money would not induce him to attempt it.

Late in the afternoon we landed on the opposite side, on the most sacred spot connected with the wanderings of the Israelites, where they rose from the dry bed of the sea, and, at the command of Moses, the divided waters rushed together, overwhelming Pharaoh and his chariots, and the whole host of Egypt. With the devotion of a pious pilgrim, I picked up a shell, and put it in my pocket as a memorial of the place; and then Paul and I, mounting the dromedaries which my guide had brought down to the shore in readiness, rode to a grove of palm-trees, shading a fountain of bad water, called Ayoun Monssa, or the Fountain of Moses. I was riding carelessly along, looking behind me towards the sea, and had almost reached the grove of palm-trees, when a large flock of crows flew out, and my dromedary, frightened with their sudden whizzing, started back and threw me twenty feet over his head, completely clear of his long neck, and left me sprawling in the sand. It was a mercy I did not finish my wanderings where the children of Israel began theirs; but I saved my head at the expense of my hands, which sank in the loose soil up to the wrist, and bore the marks for more than two months afterwards. I seated myself where I fell, and, as the sun was just dipping below the horizon, told Paul to pitch the tent, with the door towards the place of the miraculous passage. I shall never forget that sunset scene, and it is the last I shall inflict upon the reader. I was sitting on the very spot where the chosen people of God, after walking over the dry bed of the sea, stopped to behold the divided waters returning to their place and swallowing up the host of the pursuers. The mountains on the other side looked dark and portentous, as if proud and conscious witnesses of the mighty miracle, while the sun, descending slowly behind them, long after it had disappeared, left a reflected brightness which illumined with an almost supernatural light the dark surface of the water.

But to return to the Fountain of Moses. I am aware that there is some dispute as to the precise spot where Moses crossed; but having no time for scepticism on such matters, I began by making up my mind that this was the place, and then looked around to see whether, according to the account given in the Bible, the face of the country and the natural landmarks did not sustain my opinion. I remember I looked up to the head of the gulf, where Suez or Kolsum now stands, and saw that almost to the very head of the gulf there was a high range of mountains which it would be necessary to cross, an undertaking which it would have been physically impossible for 600,000 people, men, women, and children, to accomplish, with a hostile army pursuing them. At Suez, Moses could not have been hemmed in as he was; he could go off into the Syrian Desert, or, unless the sea has greatly changed since that time, round the head of the gulf. But here, directly opposite where I sat, was an opening in the mountains, making a clear passage from the desert to the shore of the sea. It is admitted that, from the earliest history of the country, there was a caravan route from the Ramesh of the Pharaohs to this spot, and it was perfectly clear to my mind that, if the account be true at all, Moses had taken that route; that it was directly opposite me, between the two mountains, where he had come down with his multitude to the shore, and that it was there

he had found himself hemmed in, in the manner described in the Bible, with the sea before him, and the army of Pharaoh in his rear; it was there he had stretched out his hand and divided the waters; and probably, on the very spot where I sat, the children of Israel had kneeled upon the sands to offer thanks to God for his miraculous interposition. The distance, too, was in confirmation of this opinion. It was about twenty miles across; the distance which that immense multitude, with their necessary baggage, could have passed in the space of time (a night) mentioned in the Bible. Besides my own judgment and conclusions, I had authority on the spot, in my Bedouin Toualeb, who talked of it with as much certainty as if he had seen it himself; and, by the waning light of the moon, pointed out the metes and bounds according to the tradition received from his fathers. "And even yet," said he, "on a still evening like this, or sometimes when the sea is raging, the ghosts of the departed Egyptians are seen walking upon the waters; and once, when, after a long day's journey, I lay down with my camels on this very spot, I saw the ghost of Pharaoh himself, with the crown upon his head, flying with his chariot and horses over the face of the deep; and even to this day the Arab diving for coral, brings up fragments of swords, broken helmets, or chariot-wheels, swallowed up with the host of Egypt."

Early the next morning we resumed our journey, and travelled several hours along a sandy valley, diverging slowly from the sea, and approaching the mountains on our left. The day's journey was barren of incident, though not void of interest. We met only one small caravan of Bedouins, with their empty sacks, like the children of Jacob of old, journeying from a land of famine to a land of plenty. From time to time we passed the bones of a camel bleaching on the sand, and once the body of one just dead, his eyes already picked out, and their sockets hollow to the brain. A huge vulture was standing over him, with his long talons fastened in the entrails, his beak and his whole head stained with blood. I drove the horrid bird away; but before I had got out of sight, he had again fastened on his prey.

The third day we started at seven o'clock, and, after three hours' journeying, entered among the mountains of Sinai. The scene was now entirely changed in character; the level expanse of the sandy desert for the wild and rugged mountain-pass. At eleven we came to the fountain of Marah, supposed to be that at which the Israelites rested after their three days' journey from the Red Sea. There is some uncertainty as to the particulars of this journey; the print of their footsteps did not long remain in the shifting sands; their descendants have long been strangers in the land; and tradition but imperfectly supplies the want of more accurate and enduring records. Of the general fact there is no doubt; no other road from the Red Sea to Mount Sinai has existed since the days of Moses, and there is no part of the world where the face of nature and the natural land-marks have remained so totally unchanged. Then, as now, it was a barren mountainous region, bare of verdure, and destitute of streams of living water; so that the Almighty was obliged to sustain his people with manna from heaven, and water from the rocks.

But travellers have questioned whether this is the fountain of Marah. The Bible account is simple and brief—"They went three days into the wilderness, and found no water; and when they came to Marah, they could not drink of the waters of Marah, for they were bitter." Burekhardt objects that the distance is too short for three days' journey, but this cavil is sufficiently answered by others; that the movements of such an immense multitude, of all ages and both sexes, with flocks and cattle, which they must have had for the sacrifices, if for no other purpose, must necessarily have been slow. Besides, supposing the habits of the people to have been the same as we find them now among Orientals, the presumption is rather that they would march slowly than push on with speed, after the danger of pursuit was over. Time is thought of

little consequence by the Arabs; and as the Jews were Arabs, it is probable that the same was a feature of their character also. At all events, I was disposed to consider this the fountain, and would fain have performed the duty of a pious pilgrim by making my noon-day meal at its brink; but, as in the days of Moses, we could not drink of the waters of Marah, "for they were bitter." I do not wonder that the people murmured, for even our camels would not drink of them. The ground around the fountain was white with salt. In about two hours more we came to the valley of Gherondel, a large valley with palm-trees; away at the right, in the mountains, is another spring of water, which Shaw makes the bitter fountain of Moses, the water being also undrinkable.

That night Paul was unwell, and, as it always happened with him when he had a headache, he thought he was going to die. As soon as we pitched our tent, I made him lie down; and not knowing how to deal with his real and fancied ailments, gave him some hot tea, and then piled upon him quilts, blankets, empty sacks, saddle-cloths, and every other covering I could find, until he cried for quarter. I had no difficulty in cooking my own supper, and, I remember, tried the savage taste of my Bedouins with the China weed, which they liked exceedingly, when so abundantly sweetened as utterly to destroy its flavour.

#### CHAPTER XV.

The Aspect of the Mountains.—Arab Graves.—The Pacha and the Bedouins.—The Value of Water.—Perplexing Inscriptions.—Habits of the Arabs.—Ethics of the Desert.—Breach of the Marriage Vow.—Arrival at the Convent.—An Excess of Welcome.—Greece and America.—Amor Patriæ.

In the morning Paul was well, but I recommended a little starvation to make all sure; this, however, by no means agreed with his opinion, or his appetite; for, as he said, a man who rode a dromedary all day must eat or die. Late in the afternoon we passed a hill of stones, which Burekhardt calls the tomb of a saint; but according to Toualeb's account, and he spoke of it as a thing within his own knowledge, it was the tomb of a very different personage, namely, a woman who was surprised by her kindred with a paramour, and killed and buried on the spot; on a little eminence above, a few stones marked the place where a slave had been stationed to give the guilty pair a timely notice of approaching danger, but had neglected his important trust.

Our road now lay between wild and rugged mountains, and the valley itself was stony, broken, and gullied by the washing of the winter torrents; and a few straggling thorn-bushes were all that grew in that region of desolation. I had remarked for some time, and every moment impressed it more and more forcibly upon my mind, that every thing around me seemed old and in decay: the valley was barren and devastated by torrents; the rocks were rent; the mountains cracked, broken, and crumbling into thousands of pieces; and we encamped at night between rocks which seemed to have been torn asunder by some violent convulsion, where the stones had washed down into the valley, and the drifted sand almost choked the passage. It had been excessively hot during the day, and at night the wind was whistling around my tent as in mid-winter.

Early in the morning we were again in motion, our route lying nearly all day in the same narrow valley, bounded by the same lofty mountains. At every step the scene became more solemn and impressive; all was still around us; and not a sound broke the universal silence, except the soft tread of our camels, and now and then the voice of one of us; but there was little encouragement to garrulity. The mountains became more and more striking, venerable, and interesting. Not a shrub or blade of grass grew on their naked sides, deformed with gaps and fissures; and they looked as if, by a slight jar or shake, they would crumble into millions of pieces. It is impossible to describe correctly the singularly interesting appearance of these mountains.

Age, hoary and venerable, is the predominant character. They looked as if their great Creator had made them higher than they are, and their summits, worn and weakened by the action of the elements for thousands of years, had cracked and fallen. My days in the desert did not pass as quickly as I hurry through them here. They wore away, not slowly alone, but sometimes heavily; and to help them in their progress, I sometimes descended to very commonplace amusements. On one occasion I remember meeting a party of friendly Bedouins, and, sitting down with them to pipes and coffee, I noticed a fine lad of nineteen or twenty, about the size of one of my party, and pitted mine against him for a wrestling-match. The old Bedouins took the precaution to remove their knives and swords, and it was well they did, for the two lads throttled each other like young furies; and when mine received a pretty severe prostration on the sand, he first attempted to regain his sword, and, failing in that, sprang again upon his adversary with such ferocity that I was glad to have the young devils taken apart, and still more glad to know that they were going to travel different roads.

Several times we passed the rude burying-grounds of the Bedouins, standing alone in the waste of sand, a few stones thrown together in a heap marking the spot where an Arab's bones reposed; but the wanderer of the desert looks forward to his final rest in this wild burying-place of his tribe with the same feeling that animates the English peasant towards the churchyard of his native village, or the noble peer towards the honoured tomb of his ancestors.

About noon we came to an irregular stone fence, running across the valley and extending up the sides nearly to the top of the adjacent mountains, built as a wall by the Bedouins of Sinai during the war with the Pacha of Egypt. Among the strong and energetic measures of his government, Mahommed Ali had endeavoured to reduce these children of the desert under his iron rule; to subject them to taxes, like his subjects of the Nile, and, worse, to establish his oppressive system of military conscription. But the free spirit of the untameable could not brook this invasion of their independence. They plundered his caravans, drank his best Mocha coffee, devoured his spices from Arabia and India, and clothed themselves and their wives in the rich silks intended for the harems of the wealthy Turks. Hassan Bey was sent against them with 2500 men; 400 Bedouins defended this pass for several days, when, craftily permitting him to force his way to the convent of Mount Sinai, the tribes gathered in force between him and the Red Sea, and held him there a prisoner until a treaty of perpetual amity had been ratified by the pacha, by which it was agreed that the pacha should not invade their territory, and that they would be his subjects, provided he would not call upon them for duties, or soldiers, or, indeed, for any thing which should abridge their natural freedom; or, in other words, that he might do as he pleased with them, provided he let them have their own way. It was, in fact, the school-boy's bargain, "Let me alone, and I will let you alone," and so it has been faithfully kept by both parties, and I have no doubt will continue to be kept, until one of them shall have a strong probability of profit and success in breaking it. Upon the whole, however, the Bedouins of Mount Sinai are rather afraid of Mahommed Ali, and he has a great rod over them in his power of excluding them from Cairo, where they come to exchange their dates and apricots for grain, clothing, weapons, and ammunition. As they told me themselves, before his time they had been great robbers, and now a robbery is seldom heard of among them.

For two days we had been suffering for want of water. The skins with which I had been provided by the consul's janizary at Cairo were so new that they contaminated the water; and it had at last become so bad, that, fearful of injurious effects from drinking it, and preferring the evil of thirst to that of sickness, I had poured it all out upon the sand. Toualeb had told me that some time during the day we should come to a fountain,

but the evening was drawing nigh, and we had not reached it. Fortunately we had still a few oranges left, which served to moisten our parched mouths; and we were in the momentary expectation of coming to the water, when Toualeb discovered some marks, from which he told us that it was yet three hours distant. We had no apprehension of being reduced to the extremity of thirst; but for men who had already been suffering for some time, the prolongation of such thirst was by no means pleasant. During those three hours I thought of nothing but water. Rivers were floating through my imagination, and, while moving slowly on my dromedary, with the hot sun beating upon my head, I wiped the sweat from my face, and thought upon the frosty Caucasus; and when, after travelling an hour aside from the main track, through an opening in the mountains, we saw a single palm-tree shading a fountain, our progress was gradually accelerated, until, as we approached, we broke into a run, and dashing through the sand, and without much respect of persons, all threw ourselves upon the fountain.

If any of my friends at home could have seen me then, they would have laughed to see me scrambling among a party of Arabs for a place around a fountain, all prostrate on the ground, with our heads together, for a moment raising them to look gravely at each other while we paused for breath, and then burying our noses again in the delicious water; and yet, when my thirst was satisfied, and I had time to look at it, I thought it lucky that I had not seen it before. It was not a fountain, but merely a deposit of water in a hollow sandstone rock; the surface was green, and the bottom muddy. Such as it was, however, we filled our skins, and returned to the main track.

We continued about an hour in the valley, rising gently until we found ourselves on the top of a little eminence, from which we saw before us another valley, bounded also by high rocky cliffs; and directly in front, still more than a day's journey distant, standing directly across the road, and, as has been forcibly and truly said, "looking like the end of the world," stood the towering mountains of Sinai. At the other end of the plain the mountains contracted, and on one side was an immense block of porphyry, which had fallen, probably, thousands of years ago. I could still see where it had come leaping and crashing down the mountain-side, and trace its destructive course to the very spot where it now lay, itself almost a mountain, though a mere pebble when compared with the giant from which it came. I pitched my tent by its side, with the door open to the holy mountain, as many a weary pilgrim had done before me. The rock was covered with inscriptions, but I could not read them. I walked round and round it with Paul at my elbow, looking eagerly for some small scrap, a single line, in a language we could read; but all were strange, and at length we gave up the search. In several places in the wilderness of Sinai, the rocks are filled with inscriptions, supposed to have been made by the Jews; and finding those before me utterly beyond my comprehension, I resolved to carry them back to a respectable antiquity, and in many of the worn and faded characters, to recognise the work of some wandering Israelite. I meditated, also, a desperate but noble deed. Those who had written before me were long since dead; but in this lonely desert they had left a record of themselves and of their language. I resolved to add one of my country's also. Dwelling fondly in imagination upon the absorbing interest with which some future traveller, perhaps from my own distant land, would stop to read on this lonely rock a greeting in his native tongue, I sought with great care a stone that would serve as a pencil. It made a mark which did not suit me, and I laid it down to break it into a better shape, but unluckily smashed my fingers, and in one moment all my enthusiasm of sentiment was gone; I crammed my fingers into my mouth, and danced about the rock in an agony of heroics; and so my inscription remained unwritten.

At seven o'clock of the tenth day from Cairo I was again on my dromedary, and during the whole day the

lofty top of Sinai was constantly before me. We were now in a country of friendly Arabs. The Bedouins around Mount Sinai were all of the same tribe, and the escort of any child of that tribe was a sufficient protection. About nine o'clock Toualeb left me for his tent among the mountains. He was a little at a loss, having two wives living in separate tents, at some distance from each other, and he hesitated which to visit. I made it my business to pry into particulars, and found the substance of the Arab's nature not much different from other men's. Old ties and a sense of duty called him to his old wife—to her who had been his only wife when he was young and poor; but something stronger than old ties or the obligation of duty impelled him to his younger bride. Like the Prophet whom he worshipped, he honoured and respected his old wife, but his heart yearned to her younger and more lovely rival.

The last was by far the most interesting day of my journey to Mount Sinai. We were moving along a broad valley, bounded by ranges of lofty and crumbling mountains, forming an immense rocky rampart on each side of us; and rocky and barren as these mountains seemed, on their tops were gardens which produced oranges, dates, and figs, in great abundance. Here, on heights almost inaccessible to any but the children of the desert, the Bedouin pitches his tent, pastures his sheep and goats, and gains the slender subsistence necessary for himself and family; and often, looking up the bare side of the mountain, we could see on its summit's edge the wild figure of a half-naked Arab, with his long match-lock gun in his hand, watching the movement of our little caravan. Sometimes, too, the eye rested upon the form of a woman stealing across the valley, not a traveller or passer-by, but a dweller in the land where no smoke curled from the domestic hearth, and no sign of a habitation was perceptible. There was something very interesting to me in the greetings of my companions with the other young men of their tribe. They were just returning from a journey to Cairo, an event in the life of a young Bedouin, and they were bringing a stranger from a land that none of them had ever heard of; yet their greeting had the coldness of frosty age, and the reserve of strangers; twice they would gently touch the palms of each other's hands, mutter a few words, and in a moment the welcome were again climbing to their tents. One, I remember, greeted us more warmly, and stood longer among us. He was by profession a beggar or robber, as occasion required, and wanted something from us, but it was not much; merely some bread and a charge of powder. Not far from the track, we saw, hanging on a thorn-bush, the black cloth of a Bedouin's tent, with the pole, ropes, pegs, and every thing necessary to convert it into a habitation for a family. It had been there six months; the owner had gone to a new pasture-ground, and there it had hung, and there it would hang, sacred and untouched, until he returned to claim it. "It belongs to one of our tribe, and cursed be the hand that touches it," is the feeling of every Bedouin. Uncounted gold might be exposed in the same way; and the poorest Bedouin, though a robber by birth and profession, would pass by and touch it not.

On the very summit of the mountain, apparently enscathed behind it as a wall, his body not more than half visible, a Bedouin was looking down upon us; and one of my party, who had long kept his face turned that way, told me that there was the tent of his father. I talked with him about his kindred and his mountain home, not expecting, however, to discover any thing of extraordinary interest or novelty. The sons of Ishmael have ever been the same, inhabitants of the desert, despising the dwellers under a roof, wanderers and wild men from their birth, with their hands against every man, and every man's hand against them. "There is blood between us," says the Bedouin when he meets in the desert one of a tribe by some individual of which an ancestor of his own was killed, perhaps a hundred years before. And then they draw their swords, and a new account of blood is opened, to be handed down as a legacy to their children. "Thy aunt wants thy purse,"

says the Bedouin when he meets the stranger travelling through his wild domain. "The desert is ours, and every man who passes over it must pay us tribute." These principal and distinguishing traits of the Bedouin character have long been known; but as I had now been with them ten days, and expected to be with them a month longer, to see them in their tents, and be thrown among different tribes, claiming friendship from those who were enemies to each other, I was curious to know something of the lighter shades, the details of their lives and habits; and I listened with exceeding interest while the young Bedouin, with his eyes constantly fixed upon it, told me that for more than 400 years the tent of his fathers had been in that mountain. Wild and unsettled, robbers and plunderers as they are, they have laws which are as sacred as our own; and the tent, and the garden, and the little pasture-ground, are transmitted from father to son for centuries. I have probably forgotten more than half of our conversation; but I remember he told me that all the sons shared equally; that the daughters took nothing; that the children lived together; that if any of the brothers got married, the property must be divided; that if any difficulty arose on the division, the man who worked the place for a share of the profits must divide it; and, lastly, that the sisters must remain with the brothers, until they (the sisters) are married. I asked him, if the brothers did not choose to keep a sister with them, what became of her; but he did not understand me. I repeated the question, but still he did not comprehend it, and looked to his companions for an explanation. And when, at last, the meaning of my question became apparent to his mind, he answered, with a look of wonder, "It is impossible; she is his own blood." I pressed my question again and again in various forms, suggesting the possibility that the brother's wife might dislike the sister, and other very supposable cases; but it was so strange an idea, that to the last he did not fully comprehend it, and his answer was still the same—"It is impossible; she is his own blood." Paul was in ecstasies at the noble answers of the young savage, and declared him the finest fellow he had ever met since he left Cairo. This was not very high praise, to be sure; but Paul intended it as a compliment, and the young Bedouin was willing to believe him, though he could not exactly comprehend how Paul had found it out.

I asked him who governed them; he stretched himself up, and answered in one word, "God." I asked him if they paid tribute to the pacha; and his answer was, "No, we take tribute from him." I asked him how. "We plunder his caravans." Desirous to understand my exact position with the sheik of Akaba, under his promise of protection, I asked him if they were governed by their sheik; to which he answered, "No, we govern him." The sheik was their representative, their mouthpiece with the pacha and with other tribes, and had a personal influence, but not more than any other member of the tribe. I asked him, if the sheik had promised a stranger to conduct him through his territory, whether the tribe would not consider themselves bound by his promise. He said no; they would take the sheik apart, ask him what he was going to do with the stranger; how much he was going to get; and, if they were satisfied, would let him pass, otherwise they would send him back; but they would respect the promise of the sheik so far as not to do him any personal injury. In case of any quarrel or difference between members of a tribe, they had no law or tribunal to adjust it; but if one of them was wounded—and he spoke as if this was the regular consequence of a quarrel—upon his recovery he made out his account, charging a per diem price for the loss of his services, and the other must pay it. But what if he will not? "He must," was the reply, given in the same tone with which he had before pronounced it "impossible" for the brother to withhold protection and shelter from his sister. If he does not, he will be visited with the contempt of his tribe, and very soon he or one of his near relations will be killed. They have a law which is as powerful in its

operations as any that we have; and it is a strange and not uninteresting feature in their social compact, that what we call public opinion should be as powerful among them as among civilised people, and that even the wild and lawless Bedouin, a man who may fight, rob, and kill with impunity, cannot live under the contempt of his tribe.

In regard to their yet more domestic habits, he told me that though the law of Mahommed allowed four wives, the Bedouin seldom took more than one, unless that one was barren or could not make good bread, or unless he fell in love with another girl, or could afford to keep more than one; with these, and some few other extraordinary exceptions, the Bedouin married but one wife; and the chastity of women was protected by sanguinary laws, the guilty woman having her head cut off by her own relations, while her paramour, unless caught in the act, is allowed to escape; the Arabs proceeding on the ground that the chastity of the woman is a pearl above all price; that it is in her own keeping; and that it is but part of the infirmity of man's nature to seek to rob her of it.

The whole day we were moving between parallel ranges of mountains, receding in some places, and then again contracting, and at about mid-day entered a narrow and rugged defile, bounded on each side with precipitous granite rocks more than a thousand feet high. We entered at the very bottom of this defile, moving for a time along the dry bed of a torrent, now obstructed with sand and stones, the rocks on every side shivered and torn, and the whole scene wild to sublimity. Our camels stumbled among the rocky fragments to such a degree that we dismounted, and passed through the wild defile on foot. At the other end we came suddenly upon a plain table of ground, and before us towered in awful grandeur, so huge and dark that it seemed close to us and barring all farther progress, the end of my pilgrimage, the holy mountain of Sinai. On our left was a large insulated stone, rudely resembling a chair, called the chair of Moses, on which tradition says that Moses rested himself when he came up with the people of his charge; farther on, upon a little eminence, are some rude stones, which are pointed out as the ruins of the house of Aaron, where the great high-priest discoursed to the wandering Israelites. On the right is a stone alleged to be the petrified golden calf. But it was not necessary to draw upon false and frivolous legends to give interest to this scene; the majesty of nature was enough. I felt that I was on holy ground; and dismounting from my dromedary, loitered for more than an hour in the valley. It was cold, and I sent my shivering Bedouins forward, supposing myself to be at the foot of the mountain, and lingered there until after the sun had set. It was after dark, as alone, and on foot, I entered the last defile leading to the holy mountain. The moon had risen, but her light could not penetrate the deep defile through which I was toiling slowly on to the foot of Sinai. From about half-way up it shone with a pale and solemn lustre, while below all was in the deepest shade, and a dark spot on the side of the mountain, seeming perfectly black in contrast with the light above it, marked the situation of the convent. I passed a Bedouin tent, under which a group of Arabs were sleeping around a large fire, and in a few moments stood at the foot of the convent wall. My camels were lying down eating their evening meal, and my Bedouins were asleep on the ground close under the walls.

Knowing that they would not be admitted themselves, they had not demanded entrance; and as I had not told them to do so, they had not given notice of my coming. The convent was a very large building, and the high stone walls surrounding it, with turrets at the corners, gave it the appearance of a fortress. Exposed as they are to occasional attacks by the Bedouins, the holy fathers are sometimes obliged to have recourse to carnal weapons. The walls are accordingly mounted with cannon, and there is no entrance except by a subterraneous passage under the garden, or by a small door in one of the walls, about thirty feet from the ground.

My Bedouins had stopped under this door, and here we commenced shouting for admission, first singly, and then altogether, in French, English, and Arabic; but no one came to admit us. I was strongly reminded of the scene under the walls of the little convent in the desert, on my attempted expedition to the great Oasis. Then, as now, it was a moonlight night, and the scene was a convent, a lonely habitation of Christians, with its door closed against a fellow-*Christian*. I remember that then I had to force my way in and make my own welcome, and I resolved that no trifle should keep me from an entrance here. The convent belonged to the Greek church. I did not know how many monks were in it, or what was the sanctity of their lives, but I wished that some of them had slept with more troubled consciences, for we made almost noise enough to wake the dead; and it was not until we had discharged two volleys of fire-arms that we succeeded in rousing any of the slumbering inmates. On one side were two or three little slits or portholes, and a monk, with a long white beard and a lighted taper in his hand, cautiously thrust out his head at one of them, and demanded our business. This was soon told; we were strangers and Christians, and wanted admission; and had a letter from the Greek patriarch at Cairo. The head disappeared from the loophole, and soon after I saw its owner slowly open the little door, and let down a rope for the patriarch's letter. He read it by the feeble glimmer of his lamp, and then again appeared at the window, and bade us welcome. The rope was again let down; I tied it around my arms; and after dangling in the air for a brief space, swinging to and fro against the walls, found myself clasped in the arms of a burly, long-bearded monk, who hauled me in, kissed me on both cheeks, our long beards rubbing together in friendly union, and, untwisting the rope, set me upon my feet, and passed me over to his associates.

By this time nearly all the monks had assembled, and all pressed forward to welcome me. They shook my hand, took me in their arms, and kissed my face; and if I had been their dearest friend just escaped from the jaws of death, they could not have received me with a more cordial greeting. Glad as I was, after a ten days' journey, to be received with such warmth by these recluses of the mountains, I could have spared the kissing. The custom is one of the detestable things of the East. It would not be so bad if it were universal, and the traveller might sometimes receive his welcome from rosy lips; but, unhappily, the women hide their faces and run away from a stranger, while the men rub him with their bristly beards. At first I went at it with a stout heart, flattering myself that I could give as well as take; but I soon finched and gave up. Their beards were the growth of years, while mine had only a few months to boast of, and its downward aspirations must continue many a long day before it would attain the respectable longitude of theirs.

During the kissing scene, a Bedouin servant came from the other end of the terrace with an armful of burning brush, and threw it in a blaze upon the stony floor. The monks were gathered around, talking to me and uttering assurances of welcome, as I knew them to be, although I could not understand them; and, confused and almost stunned with their clamorous greeting, I threw myself on the floor, thrust my feet in the fire, and called out for *Paul*. Twice the rope descended and brought up my tent, baggage, &c.; and the third time it brought up *Paul*, hung round with guns, pistols, and swords, like a travelling battery. The rope was wound up by a windlass, half a dozen monks, in long black frocks with white stripes, turning it with all their might. In the general eagerness to help, they kept on turning until they had carried *Paul* above the window, and brought his neck up short under the beam, his feet struggling to hold on to the sill of the door. He roared out lustily in Greek and Arabic; and while they were helping to disencumber him of his multifarious armour, he was cursing and abusing them for a set of blundering workmen, who had almost broken the neck of as

good a Christian as any among them. Probably, since the last incursion of the Bedouins, the peaceful walls of the convent had not been disturbed by such an infernal clatter.

The monks had been roused from sleep, and some of them were hardly yet awake; the superior was the last who came, and his presence quickly restored order. He was a remarkably noble-looking old man, of more than sixty. He asked me my country, and called me his child, and told me that God would reward me for coming from so distant a land to do homage on the holy mountain; and I did not deny the character he ascribed to me, or correct his mistake in supposing that the motive of my journey was purely religious; and looking upon me as a devout pilgrim, he led me through a long range of winding passages, which seemed like the streets of a city, into a small room spread with mats, having a pile of coverlets in one corner, and wearing an appearance of comfort that could be fully appreciated by one who had then spent ten nights in the desert. I threw myself on the mats with a feeling of gratitude, while the superior renewed his welcome, telling me that the convent was the pilgrim's home, and that every thing it contained was mine for a week, a month, or the rest of my days. Nor did he neglect my immediate wants, but, with all the warmth and earnestness of a man who could feel for others' woes in so important a matter as eating, expressed his regret that meat was always a forbidden thing within the walls of the convent, and that now, during their forty days of fasting, even fish and eggs were proscribed. I told him that I was an invalid, and wanted only the plainest and simplest viands, but insinuated that speed was of more importance than richness of fare, having eaten only a biscuit and an orange since morning. The cook of the convent, however, a lay brother in his novitiate, was not used to do things in a hurry, and before he was ready I felt myself goaded by the fiend of famine; and when he came with a platter of beans and a smoking pilau of rice, I made such an attack upon them as made the good superior stare with wonder and admiration; and I have no doubt that, before I had done, he must have thought a few more such invalids would bring him and the whole brotherhood to actual starvation.

The superior was a Greek by birth; and though it was forty years since he had first come to the convent at Sinai, and twenty years since he entered it for the last time, he was still a Greek in heart. His relations with his native land were kept up by the occasional visits of pilgrims. He had heard of their bloody struggle for liberty, and of what America had done for her in her hour of need, and he told me that, next to his own country, he loved mine; and by his kindness to me as an individual, he sought to repay, in part, his country's debt of gratitude. In my wanderings in Greece, I had invariably found the warmest feeling towards my country. I had found it in the offices of government, in my boatmen, my muleteer, and I remember a ploughman on immortal Marathon sang in my greedy ears the praises of America. I had seen the tear stream down the manly cheeks of a mustached Greek when he talked of America. I had seen those who had received directly from the hands of my countrymen the bounty that came from home. One, I remember, pointed me to a family of sons and daughters, who, he told me, were saved from absolute starvation by our timely help; and so dearly was our country loved there, that I verily believe the mountain robber would have spared the unprotected American.

I knew that this feeling existed in Greece, but I did not expect to find it thus glowing in the wilderness of Sinai. For myself, different in this respect from most other travellers, I liked the Greeks. Travellers and strangers condemn the whole people as dishonest because they are cheated by their boatmen or muleteers, without ever thinking of their four centuries of bitter servitude; but when I remembered their long oppression and galling chains, instead of wondering that they were so bad, I wondered that they were not worse. I

liked the Greeks; and when I talked of Greece and what I had seen there, of the Bavarians lording it over the descendants of Cimon and Miltiades, the face of the superior flushed, and his eyes flashed fire; and when I spoke of the deep interest their sufferings and their glorious struggle had created in America, the old man wept. Oh, who can measure the feeling that binds a man to his native land! Though forty years an exile, buried in the wilderness, and neither expecting nor wishing to revisit the world, he loved his country as if his foot now pressed her soil, and under his monkish robe there glowed a heart as patriotic as ever beat beneath a soldier's corslet. The reader will excuse an unusual touch of sensibility in me when he reflects upon my singular position, sitting at the base of Mount Sinai, and hearing from the lips of a white-bearded Greek the praises of my beloved country. He sat with me till the ringing of the midnight bell for prayers, when I threw myself upon the mat, and, before the hollow sounds had died away in the cloisters, I was fast asleep.

#### CHAPTER XVI.

Ascent of Sinai.—A Miracle.—The Grotto of Elias.—A Monkish Legend.—The Pinnacle of Sinai.—Anchorites.—Mahommed and his Camel.—An Argument.—Legend of St Catharine.—The Rock of the Tables.—The Stone struck by Moses.—Description of the Convent.—Habits and Character of its Inmates.

THE next day was one of the most interesting of my life. At eight o'clock I was breakfasting; the superior was again at my side; again offering me all the convent could give, and urging me to stay a month, a fortnight, a week, at least to spend that day with him, and repose myself after the fatigues of my journey; but from the door of the little room in which I sat, I saw the holy mountain, and I longed to stand on its lofty summit. Though feeble and far from well, I felt the blood of health again coursing in my veins, and congratulated myself that I was not so hackneyed in feeling as I had once supposed. I found, and I was happy to find, for the prospective enjoyment of my farther journey, that the first tangible monument in the history of the Bible, the first spot that could be called holy ground, raised in me feelings that had not been awakened by the most classic ground of Italy and Greece, or the proudest monuments of the arts in Egypt.

Immediately after breakfast I rose to ascend the mountain. The superior conducted me through the convent, which, even more than at night, seemed like a small city, through long galleries built of stone, with iron doors, and finally through a long subterranean passage to the outer garden, a beautiful spot in the midst of the surrounding barrenness, now blooming with almonds and oranges, lemons, dates, and apricots, and shaded by arbours of grape-vines to the extreme end of the walls. At this moment I gave but a passing glance at the garden; and hurrying on to the walls, where a trusty Arab was sitting as sentinel, I descended by a rope, the superior, or papa, as he is called, bidding me farewell, and telling me not to fatigue myself or be long away. At the foot of the wall I found Toualeb waiting orders for my final departure. He said that he must consult with his tribe before he could make any bargain; and I told him to come to the convent in two days, prepared to start upon the third.

Immediately behind the wall of the convent we began to ascend. A Bedouin dwarf, the first specimen of deformity I had seen among the Arabs, led the way, with a leather bag of refreshments on his back. An old monk followed, with long white hair and beard, supporting himself by a staff; after him came a young novice from Corfu, who spoke Italian, and then Paul and myself. For some time the ascent was easy. Ever since the establishment of the convent, it had been the business of the monks to improve the path to the top of the mountain; and for about twenty minutes we continued ascending by regular steps. In half an hour we came to a beautiful fountain under an overhanging rock. Besides the hallowed localities in and around the moun-

tain, consecrated by scenes of Bible history, almost every spot has some monkish legend, of which that connected with the fountain is a specimen. Taking a long draught from its stony bed, our younger companion began the story somewhat in the usual Eastern form. "Once there was a poor shoemaker" who, in making his pilgrimage to the holy mountain, on a hot day, sat down under the shade of the impending rock. He was an industrious man, and while resting himself, took out his cobbling materials, and began to cobble; he was a good man, and while he sat there at his work, he thought of the wickedness of the world and its temptations, and how the devil was always roaming about after poor cobblers, and resolved to leave the world for ever, and live under that rock. There was no water near it then; but as soon as he had made this resolution, the water gushed forth, and a living fountain has remained there ever since. The same year there was a dispute between the Greek and Armenian patriarchs at Cairo, and the pacha gave notice that he would decide in favour of him who should perform a miracle. This was more than either had power to do; but the Greek dreamed one night of the poor cobbler, and the next morning dispatched a messenger to the mountain with a dromedary, and a request that the holy man should come and perform a miracle. The cobbler was a modest man, and said he would be glad to make a pair of shoes for the patriarch, but could not perform a miracle. The messenger, however, insisted upon taking him to Cairo, where, roused into a belief of his own powers, he ordered a mountain to approach the city. The obedient mountain marched till it was told to stop, and there it stands to the present day.

In half an hour more we came to a little chapel dedicated to the Virgin, to which, some 200 or 300 years ago, certain holy men, who wished to separate themselves more completely from the world, had withdrawn from the convent, and here lived and died upon the mountain. The chapel had been fitted up several times, but the Bedouins had always entered and destroyed every thing it contained. The situation was well suited for retirement; quiet and isolated, but not dreary, and fitted for a calm and contemplative spirit. Paul was particularly struck with it, and in a moment of enthusiasm said he would like to end his days there; and, with his characteristic prudence, asked if he could get his meals from the convent. The monk did not approve his enthusiasm, and told him that his inspiration was of the devil, and not of God, but suddenly said that there were no hermits now; that all men thought too much of eating and drinking, and indulging in luxuries; sighed, kissed the cross, asked Paul for a cigar, and then walked on again. Passing through a defile of precipitous rocks, we soon reached a gate about three feet wide, where formerly, when pilgrimages to this place were more frequent, a guard was stationed, to whom it was necessary to show a permission from the superior of the convent. A little beyond this was another narrow passage secured by a door, where it was formerly necessary to show a pass from the keeper of the gate, and where a dozen men could make a good defence against a thousand. Soon after we entered a large open space, forming a valley surrounded on all sides by mountains; and on the left, high above the others, rose the lofty peak of Sinai. It is this part of the mountain which bears the sacred name of Horeb. In the centre, enclosed by a stone fence, is a tall cypress, the only tree on the mountain, planted by the monks more than 100 years ago. Near it is a fountain, called the Fountain of Elias, which the prophet dug with his own hands when he lived in the mountain, before he was ordered by the Lord to Jerusalem. According to the monks, the prophet is still living somewhere in the world, wandering about with Enoch, and preparing for the great final battle with Antichrist. A little above is an old church, with strong walls and iron doors, now falling and dilapidated, and containing a grotto, called the Grotto of Elias, which, according to the legend, formed the prophet's sleeping-chamber. I crawled into the rocky cell,

and, thanks to my travelling experience, which had taught me not to be fastidious in such matters, found the bedroom of the prophet by no means an uncomfortable place; often in the desert I would have been thankful for such a shelter.

Here our dwarf left us, and, continuing our ascent, the old monk still leading the way, in about a quarter of an hour we came to a table of rock standing boldly out, and running down almost perpendicularly an immense distance to the valley. I was expecting another monkish legend, and my very heart thrilled when the monk told me that this was the top of the hill on which Moses had sat during the battle of the Israelites and the Amalekites, while Aaron and Hur supported his uplifted hands, until the sun went down upon the victorious arms of his people. From the height I could see, clearly and distinctly, every part of the battle-ground, and the whole vale of Rephedim and the mountains beyond; and Moses, while on this spot, must have been visible to the contending parties from every part of the field on which they were engaged.

Some distance farther on, the old monk stopped, and prostrating himself before a stone, kissed it devoutly, and then told me its history. He said that the last time the monks in the convent were beset by the Arabs, when their communication with Cairo was cut off, and death by the sword or famine staring them in the face, the superior proposed that they should put on their holiest vestments, and, under the sacred banner of the cross, ascend in a body, and for the last time sing their Te Deum on the top of the mountain. On their return, at this stone they met a woman with a child, who told them that all their danger was over: and, in accordance with her words, when they returned to the convent they found the Arabs gone, and forty camels from Cairo laden with provisions standing under the walls. Since that time they had never been molested by the Arabs; "and there is no doubt," continued the old monk, "that the woman was the mother of God, and the child the Saviour of the world."

But away with monkish superstition. I stand upon the very peak of Sinai, where Moses stood when he talked with the Almighty. Can it be, or is it a mere dream? Can this naked rock have been the witness of that great interview between man and his Maker—where, amid thunder and lightning, and a fearful quaking of the mountain, the Almighty gave to his chosen people the precious tables of his law, those rules of infinite wisdom and goodness, which to this day best teach man his duty towards his God, his neighbour, and himself?

The scenes of many of the incidents recorded in the Bible are extremely uncertain. Historians and geographers place the garden of Eden, the paradise of our first parents, in different parts of Asia; and they do not agree upon the site of the Tower of Babel, the mountain of Ararat, and many of the most interesting places in the Holy Land; but of Sinai there is no doubt. This is the holy mountain; and among all the stupendous works of Nature, not a place can be selected more fitted for the exhibition of Almighty power. I have stood upon the summit of the giant *Étna*, and looked over the clouds floating beneath it, upon the bold scenery of Sicily, and the distant mountains of Calabria; upon the top of *Vesuvius*, and looked down upon the waves of lava, and the ruined and half-recovered cities at its foot; but they are nothing compared with the terrific solitude and bleak majesty of Sinai. An observing traveller has well called it "a perfect sea of desolation." Not a tree, or shrub, or blade of grass, is to be seen upon the bare and rugged sides of innumerable mountains, heaving their naked summits to the skies, while the crumbling masses of granite around, and the distant view of the Syrian desert, with its boundless waste of sands, form the wildest and most dreary, the most terrific and desolate, picture that imagination can conceive.

The level surface of the very top, or pinnacle, is about sixty feet square. At one end is a single rock about twenty feet high, on which, as said the monk, the spirit of God descended, while in the crevice beneath, his fa-

voured servant received the tables of the law. There, on the same spot where they were given, I opened the sacred book in which those laws are recorded, and read them with a deeper feeling of devotion, as if I were standing nearer and receiving them more directly from the Deity himself.

The ruins of a church and convent are still to be seen upon the mountain, to which, before the convent below was built, monks and hermits used to retire, and, secluded from the world, sing the praises of God upon his chosen hill. Near this, also in ruins, stands a Mahomedan mosque; for on this sacred spot the followers of Christ and Mahomed have united in worshipping the true and living God. Under the chapel is a hermit's cell, where in the iron age of fanaticism the anchorite lingered out his days in fasting, meditation, and prayer.

In the East, the fruitful parent of superstition, occurred the first instances of monastic life. A single enthusiast withdrew himself from the society of his fellow-men, and wandered for years among the rocks and sands of the desert, devoting himself to the service of his Maker by the mistaken homage of bodily mortification. The deep humility of the wanderer, his purity and sincerity, and the lashes and stripes he inflicted upon his worn and haggard body, excited the warm imaginations of the Christians of the East. Others, tortured by the same overpowering consciousness of sin, followed his example, emulating each other in self-punishment; and he was accounted the most holy, and the most worthy to be received at the right hand of God, who showed himself most dead to all the natural feelings of humanity. The deserts of the Thebaid were soon covered with hermits; and more than 70,000 anchorites were wasting their lives in the gloomy wilds of Sinai, startling the solitude with the cries of their self-inflicted torture. The ruins of their convents are still to be seen upon the rudest mountain side, in the most savage chasm, or upon the craggiest top; and, strange as the feeling may seem, my very soul cleaved to the scene around me. I, too, felt myself lifted above the world, and its petty cares and troubles, and almost hurried into the wild enthusiasm which had sent the tenants of these ruined convents to live and die among the mountains.

Blame me not, reader, nor think me impious, that, on the top of the holy mountain of Sinai, half unconscious what I did, I fired at a partridge. The sound of my gun, ringing in frequent echoes from the broken and hollow rocks, startled and aroused me; and, chasing the bird down the mountain side, I again reached "the place in Horeb," and threw myself on the ground under the palm-tree, near the Fountain of Elias.

I always endeavoured to make my noonday meal near some rock or ruin, some tree or fountain; and I could not pass by the fountain of the prophet. My Arab dwarf had anticipated my wants; and now prepared some of the genuine Mocha, which every Arabian (and an Arabian only) knows how to prepare, exhaling an aroma that refreshes and invigorates the wearied frame; and, in the desert, a cordial more precious than the finest wines of France or Madeira. Seated under the palm-tree, monks, Bedouins, Paul, and myself, all together, eating our frugal meal of bread and fruit, accompanied with long draughts from the Fountain of Elias, I talked with the Bedouins about the mountain consecrated in the eyes of all true Mussulmans by the legend of Mahomed and his camel.

In one respect I was very unlucky in this journey. I had no guide-books. Having formed no definite plan in my wanderings, I never knew with what books to provide myself, and therefore carried none, trusting to chance for finding what I wanted. As might be supposed, when I needed them most it was utterly impossible to obtain any; and from the borders of Egypt to the confines of the Holy Land, I was in some measure groping in the dark; the Bible was my only guide; and though the best a man could have in his pilgrimage through life, and far better than any other in this particular journey, yet others would have been exceedingly valuable, as illustrating obscure passages in the sacred book; and

particularly as referring, besides, to circumstances and traditions other than scriptural, connected with the holy mountain.

In the book of one of the modern travellers, I believe of the lamented Burckhardt, I remembered to have seen a reference to a tradition among the Mussulmans, that Mahomed had ascended the mountain on the back of his camel, and from its lofty summit had taken his departure to the seventh heaven, and that the prints of the beast's footsteps were still to be seen on the surface of the rock. I questioned the Arab about this story. In the more engrossing interest of the scene, I had forgotten to look for the prints of the camel's feet, and told him, with great truth, that I had examined every thing carefully, but had not seen them. The old monk, who had sat quietly munching his bread and figs, scandalised at my inquiring into such a profane story, and considering the holy mountain in a manner his property, broke out unceremoniously, and denounced it as a wicked invention of the Arabs, averring that every body knew that, before Mahomed got half way up, the camel stumbled, fell, and broke the neck of the Prophet. This was equally new and monstrous to the Arab, who swore that the legend was true, for it was written in the Koran, and that he himself had often seen the print of the foot; and he accounted for my not seeing it by the very sensible and satisfactory explanation that it was visible only to the eyes of true believers. The good father was completely roused by this obstinate resistance in the scandal; and a reckless Bedouin and an old Bulgarian monk, sitting by a fountain among the deserts of Sinai, were soon disputing with as much clamour and bitterness as if they had been brought up in the midst of civilisation, to harangue, from opposing pulpits, the preachers of the promises and the denouncers of the curses of rival churches. One thing the pious father especially insisted on: the strong point in his argument, and particularly ludicrous, as coming from such an old bundle of superstitions, was the impossibility of a camel's foot making an impression on stone; and, judging from this alone, one might have suspected him of having had in his youth some feeble glimmerings of common sense; but a few minutes after he told me the legend of Mount St Catharine.

Mount St Catharine is the great rival of Sinai in the range of mountains in the Arabian peninsula. They rise like giant twin brothers, towering above every other; and the only thing which detracts in the slightest degree from the awful supremacy of Sinai, is the fact that Mount St Catharine is somewhat the highest. The legend is, that in the early days of the Christian church the daughter of a king of Alexandria became converted. While her father remained a pagan, she tried to convert him; but, indignant at the attempt, he cast her into prison, where she was visited by the Saviour, who entered through the key-hole, and married her with a ring, which is now in the hands of the Empress of Russia. Her father cut her head off, and angels carried her body to the top of the mountain, and laid it on the rock. For centuries no one knew where it was deposited, the Christians believing that it had been carried up into heaven, until about two centuries ago, when a monk at the convent dreamed where it had been laid. The next morning he took his staff and climbed to the top of the mountain; and there, on the naked rock, fresh and blooming as in youthful beauty, after a death of more than a thousand years, he found the body of the saint. The monks then went up in solemn procession, and, taking up the body, bore it in pious triumph to the convent below, where it now lies in a coffin with a silver lid, near the great altar in the chapel, and receives the homage of all pious pilgrims.

It was nearly dark when I returned to the convent; and, in no small degree fatigued with the labours of the day, I again threw myself on the mat, and welcomed rest. In the evening the superior came to my room, and again we mingled the names of Greece and America. I was weary, and talked with the old man when I would rather have been asleep; but with his own hands he

drew mats and cushions around me, and made me so comfortable, that I could not refuse to indulge him with the rare luxury of conversation on the subject of his native land, and of the world from which he was shut out for ever. He was single-hearted and simple, or, perhaps I should rather say, simple and ignorant; I remember, for instance, when we had been embarrassed for a time by the absence of the younger monk who served as our interpreter, the old man told me very gravely, and as a new thing, which I could not be expected to know, but which he did not think the less of me for not knowing, that formerly, in the time of Adam, all mankind spoke but one tongue; and that men became wicked, and built a tower to reach to heaven (he had forgotten its name), and that God had destroyed it, and confounded the impious builders with a variety of tongues. I expressed my astonishment, as in duty bound, and denounced, in good set terms, the wickedness of our fathers, which now prevented us from enjoying at our ease the sweets of friendly converse.

Before breakfast the next morning he was with me again, with a striped abbas over his black gown, and a staff in his hand, prepared to accompany me outside the walls. I was surprised. He had told me that he had not left the convent for more than three years, when he had accompanied a great apostolic vicar, holding a distinguished situation in the church of France; and this was the last and only time he had ever bestowed such attention on a stranger. The kind-hearted old man intended it as an act of extraordinary kindness; I received it as such; and, as such, he told me I could mention it to my friends in America. Humble and unimportant as was that old monk in the great drama of life, I felt proud of his kindness—prouder than I should have been of a reception at a European court, or a greeting from royal lips—and my pride was the greater that I did not ascribe it to any merits of my own. My only claim was that possessed by all my countrymen—I was an American; my country had heard the cry of his in her distress, and from her seat across the broad Atlantic had answered that cry.

We passed, as before, through the subterraneous passages into the garden. The miserable Bedouins who were gathered around outside, waiting for the bread which they received daily from the convent, surprised at the unexpected but welcome appearance of the superior, gathered around him, and kissed his hands and the hem of his garment. He had provided himself with an extra sack of bread, which he distributed among them, and which they seemed to receive with peculiar pleasure from his hands. The monks of Mount Sinai are now no longer obliged to have recourse to carnal weapons for protection; peace reigns between them and the Bedouins; and part of the price of peace is the distribution of 2500 rolls of bread among the poor around the mountain. I did not think so much of this price when I saw the bread, hard, black, and mouldy, and such as the meanest beggar in our country would not accept from the hand of charity. But the Bedouins took it, and thanked God and the monks for it.

Hurrying away from these grateful pensioners, we descended by the defile through which we had entered; and again passing the ruins of the house of Aaron, and the spot from which he preached to the assembled people, we came to a long flat stone, with a few holes indented in its surface, which the superior pointed out as that on which Moses threw down and broke the tablets of the law, when he descended from the mountain and found the Israelites worshipping the golden calf. About half an hour farther on was another stone much holier than this; at first I understood the interpreter that it was the petrification of the golden calf; but gathered, with some difficulty, from the superior, that it was the mould in which the head of the golden calf was run. He pointed out to me the prints of the head, ears, and horns, clear even to the eyes of a man of sixty; and told me the story of the golden calf somewhat differently from the Bible account. He said that the people, wanting another god, came up with one accord and threw their

golden ornaments upon that stone, and agreed by acclamation that when it was melted they would worship whatever should come out; three times it came out the head of a calf; and then they fell down and worshipped it.

Some distance farther on we passed on our right a Hebrew burying-ground—"The burial-place," said the superior, "of the Israelites who died in their forty years' wandering among the mountains of Sinai." The old man had heard these things so long, and had told them so often, and believed them so firmly, that it would have broken his heart—besides shaking his confidence in my Christian principles—if I had intimated the slightest doubt. I asked whether the Jews ever came in pilgrimage to the mountain of their fathers; and he told me that, four years ago, two Asiatic Jews had come disguised as Europeans, and attempted to pass themselves as Christians; "but," said the priest, with a vindictive spirit lighting his usually mild eye, "I detected them under their sheeps' clothing, and they did not stay long in the convent." Yet I remember seeing on the wall of the convent, and with no small degree of interest, the name of an American Jew.

Farther on, turning into a valley which opened between the mountains on the left, we came to a garden belonging to the convent, which presented a strange appearance in the midst of the surrounding desolation, producing all kinds of fruits; where one might almost wonder to see a blade of grass put forth, the orange, the date, the fig, and the vine, are growing in rich luxuriance. The soil is formed from the debris of rocks washed from the mountains; and though too light for strong products, for fruit it is better than the rich valley of the Nile. Sitting under the shade of the fig-tree, the superior pointed out to me a rent in the mountain opposite, which, he said, was caused by an earthquake that had swallowed up two friends and servants of Moses, of whom I had never heard before, and who were so swallowed up for disobeying the orders of their earthly master.

The superior, unused to such a task as he had imposed upon himself, here completely gave out, and I left him panting under the shade of his fig-tree, while I went on to the Valley of Rephidim; and, passing another garden, came to the rock of Horeb, the stone which Moses struck with his rod, and caused the waters to gush out. The stone is about twelve feet high, and on one side are eight or ten deep gashes from one to three feet long, and from one to two inches wide, some of which were trickling with water. These gashes are singular in their appearance, though probably showing only the natural effect of time and exposure. They look something like the gashes in the bark of a growing tree, except that, instead of the lips of the gash swelling and growing over, they are worn and reduced to a polished smoothness. They are, no doubt, the work of men's hands, a clumsy artifice of the early monks to touch the hearts of pious pilgrims; but the monks of the convent, and the Greek pilgrims who go there now, believe in it with as much honesty and sincerity as in the crucifixion.

Will the reader forgive me if I say that this rock had in my eyes an interest scarcely less than that which the rod of Moses gave it? Three names were written on it: one of a German, the second of an Englishman, and the third of my early friend, the same which I had seen above the Cataracts of the Nile. When, a few years since, he bade me farewell in my native city, little did I think that I afterwards should trace him beyond the borders of Egypt, and through the wilderness of Sinai, to his grave in Jerusalem!

Again I wrote my name under his, and, returning by the way I came, found the superior still sitting under the fig-tree, and, moving on, we soon reached the convent. He hurried away to his official duties, and I retired to my room. I staid there three or four hours, poring over the scriptural account of the scenes that hallowed the wilderness of Sinai, with an attention that no sound disturbed. Indeed, the stillness of the convent was at all times most extraordinary; day or night

not a sound was to be heard but the tolling of the bell for prayers, or occasionally the soft step of a monk stealing through the cloisters.

In the afternoon I lounged around the interior of the convent. The walls form an irregular quadrangle, of about 150 paces on each side, and, as I before remarked, it has the appearance of a small city. The building was erected by the Empress Helena, the mother of the first Christian emperor, and I might almost call her the mother of the Holy Land. Her pious heart sent her, with the same spirit which afterwards animated the crusaders, to search out the holy places referred to in the Bible; and when she found one, she erected a monument to mark it for the guidance of future Christians; and the pilgrim may see the fruits of her pious labours, from the mountain where God spake in thunder, down to the place where the cock crew when Peter denied his master. The convent is capable of containing several hundred people. It was originally built as a place of defence; but the necessity of keeping it fortified has passed away: a parcel of rusty guns are lying in a sort of armoury, and a few small cannon are frowning from the walls. The cells of the monks, compared with any thing else I had seen in the East, are exceedingly comfortable; on one side, raised about a foot from the floor, is a stone platform, on which the monk spreads his mat and coverlet, and the furniture includes a table, chairs, sometimes two or three books, and the fragment of a looking-glass. There are twenty-four chapels erected to different saints, in which prayers are said regularly in rotation. I went through them, but saw nothing to interest me until I came to the church of the convent. Here I was surprised to find the handsomest Greek church I had seen, except in Russia; the floor and steps were of marble; and distributed around in various places were pillars and columns, the works of ancient artists, plundered from heathen temples, and sent to this lonely spot in the desert by the active piety of the early Christian emperors. The convent was raised in honour of the transfiguration, and the dome of the altar contains a coarse but antique painting of the holy scene. In front, near the great altar, in a coffin covered with rich palls and a silver lid, are the bones of St Catharine, the patroness of the convent. Among the chapels, one, I remember, is dedicated to Constantine and Helena, and another to Justinian and his wife; but the great object of interest is the holy of holies, the spot where God appeared to Moses in the burning bush. A chapel is now erected over it; and the pilgrim, on entering, hears at this day almost the same words which God addressed to Moses, "Put thy shoes from off thy feet, for the ground whereon thou treadest is holy ground;" I pulled off my shoes, and followed my conductor. The place is now bedizened with Grecian ornaments; the rude simplicity of nature, which beheld the interview between God and his servant, is utterly gone, and the burning bush is the last thing one would think of on the spot where it grew.

There are but few objects of interest besides. In one of the chapels are a copy of the Evangelists, written in letters of gold by the Emperor Theodosius, and portraits of the four evangelists and the twelve apostles, and all the psalms of David, written in an inconceivably small space by a young Virgin who came out and died in the desert.

The condition and character of the monks formed a subject of no little interest for my speculating observation; and I investigated their habits and dispositions as closely as bienséance and my inability for conversing with them, except through an interpreter, would permit. So far as I could judge, they seemed perfectly contented; but they were for the most part mere drones and slugs, doing little good for themselves or others, and living idly upon the misapplied bounty of Christian pilgrims. I do not mean to say that they were bad men. Most of them were too simple to be bad; and if there was evil in their nature, they had no temptation to do evil; and, after all, the mere negative goodness which does no harm is not to be lightly spoken of, in a world

so full of restlessness and mischief as this of ours. Many of them had been a long time in the convent, some as much as twenty or thirty years, and one, who was now 105 years old, had been seventy-five years worshipping the Lord, after his fashion, at the foot of Sinai. Among them were a baker, shoemaker, and tailor; they baked, cooked, made and mended for themselves, and had but one other duty to perform, and that was four times daily to kneel down and pray. Nothing could be more dull and monotonous than their lives, and none but the most sluggish or the most philosophic spirit could endure it. They were philosophers without knowing it, and dozed away their existence in one unvarying round of prayer, and meals, and sleep. Their discipline was not rigid, save in one particular, and that a matter in regard to which there has been much discussion with us; they never ate meat; no animal food of any kind is permitted to enter the walls of the convent. During all the various periods of their abode in the convent, some thirty, some forty, and one more than seventy-five years, not one of them had eaten a particle of animal food; and yet I never saw more healthy-looking men. Hardier men I have seen, for they are indolent in their habits, take but little exercise, and in most cases show a strong disposition to corpulency; but I had some little opportunity of testing their ability to endure fatigue; and though the superior soon walked himself out of breath, the monk who guided us up the mountain, and who was more than sixty years old, when he descended, after a hard day's labour, seemed less tired than either Paul or myself. I am aware that climate may make a difference; but, from my own observation and experience, I am perfectly satisfied that, even in our climate, invalids and persons of sedentary habits, and, indeed, all except labouring men, would be much benefited by a total abstinence from animal food. I have travelled for a week at a time, night and day, not under the mild sky of the East, but in the rough climate of Russia, and found myself perfectly able to endure the fatigue upon bread and milk diet; and I have been told that the Tartars who ride post from Constantinople to Bagdad in an incredibly short time, never sleeping, except on horseback, during the whole of their immense journey rigidly abstain from any thing more solid and nutritious than eggs.

The night of my return from the top of Sinai I was awake when the bell tolled for midnight prayers; and, wrapping myself in my Arab cloak, took a small lamp in my hand, and, groping my way along the passage, descended to the chapel, where the monks were all assembled. I leaned behind a protecting pillar, and watched their proceedings; and it was an event of no common interest, thus, at the dead hour of night, to be an unobserved witness of their sincerity, and earnest though erroneous devotion. There was not one among them who did not believe he was doing God good service, and that his works would find acceptance at the throne of grace, and obtain for him that blessed immortality which we are all seeking.

## CHAPTER XVII.

Diet of the Monks.—Advantages of Abstinence.—Scruples Overcome.—A mysterious Brother.—The Convent Burial-place.—Strange Charnel-houses.—Death in a Mask.—Familiarity breeds Contempt.—A Man of two Centuries.—Doubts and Fears.—Parting Gifts.—The Farewell.

THE next day was Sunday, and early in the morning the superior sent for me to come down and take my meal with the holy brotherhood. The monks were all at the table, and it was the first time I had had so good an opportunity of seeing them together. They were about thirty in number, mostly old men with long white beards, all Greeks, and some with faces as noble as Grecian chisel ever traced. There was not a beard at table less than eight inches long; and my own, though it would have been rather distinguished at home, blushed more than its natural red at its comparative insignificance. The table was a long naked board; the vessels were all of

metal, and before each man were a wooden spoon, and a drinking-cup in the form of a porringer. It was Lent, the season of forty or fifty days' fasting, during which even fish, eggs, and oil, are prohibited. A large basin of boiled beans was set before each of the monks; and, besides this, there were black olives, beans in water, salad, vinegar, salt, dates, and bread. My companions had never been pampered with luxuries, and ate their bread and beans with as keen a relish as if they were feasting on turtle and venison, and drank their water as freely as though it were Tokay or Burgundy. The meal was eaten in silence, all appearing of opinion that they came simply to eat; and the only unusual circumstance I remarked was the civility of my immediate neighbours in pushing the tempting viands before me. It was curious to see how they found the way to their mouths through such a wilderness of beard, and the spoon disappearing in a huge red opening, leaving the handle projecting from a bush of hair. The room in which we ate was perhaps sixty feet long, having at one end a chapel and altar, and a reading-desk close by, in which, during the whole of the meal, a monk was reading aloud from the lives of the saints. After dinner the monks all rose, and wiping their mouths, walked in a body to the foot of the altar, and two of them commenced burning incense. One of my neighbours took me by the hand, and led me up with them. There they knelt, prayed, and chanted, and went through a long routine of ceremonies, in which, so far as it was practicable, they carried me with them. They could not get me up and down as fast as they moved themselves, but they flung the incense at me as hard as at the worthiest of them all. I supposed this to be a sort of grace after meat, and that there it would end; but to my surprise and great regret, I found that this was merely preparatory to the administration of the sacrament. It was the second time I had been placed in the same situation; and the second time, and even more earnestly than before, I wished for that state of heart which, according to the notions of its solemnity in which I had been brought up, would have permitted me to join in the sacred rite. I refused the consecrated bread, and the monk, after pausing some moments, apparently in astonishment, passed on to the next. After he had completed the circle, the superior crossed and brought him back again to me; I could not wound the feelings of the good old man, and ate the consecrated bread and drank the wine. May God forgive me if I did wrong; but, though rigid censors may condemn, I cannot believe that I incurred the sin of "the unworthy partaker" by yielding to the benevolent importunity of the kind old priest. After this we walked out on the terrace, under the shade of some venerable grape-vines, and sitting down along the wall, took coffee. The reading-desk was brought out, and the same monk continued reading for more than two hours.

I had noticed that monk before; for he was the same who had conducted me through the church, had visited me in my room, and I had seen him in his cell. He was not more than thirty-five, and his face was as perfect as art could make it; and the sunbeams occasionally glancing through the thick foliage of the vines, and lighting up his pale and chiselled features and long black beard, made him one of those perfect figures for a sketch which I had often dreamed of, but had never seen. His face was thin, pale, and emaciated; the excitement of reading gave it a hectic flush, and he looked like a man who, almost before the springtime of life was over, had drained the cup of bitterness to its dregs. If I am not deceived, he had not always led so peaceful and innocent a life, and could unfold a tale of stirring incident, of wild and high excitement, and perhaps of crime. He was from the island of Tenos, but spoke Italian, and I had talked with him of the islands of Greece, and the ports in the Mediterranean and the Black Sea, with many of which he seemed familiar; and then he spoke of the snares and temptations of the world, and his freedom from them in the convent; and, above all, of the perils to which men are exposed by the wiles and witcheries of

the sex; and I could not but imagine that some beautiful Grecian girl, not less than fair, had driven him to the wilderness. One of the other monks told me that it was about the time when the last of the pirates were swept from the Mediterranean that the young islander had buried himself in the walls of the convent. They told me, too, that he was rich, and would give all he had to the fraternity. Poor fellow! they will soon come into possession.

In the garden of the convent is the cemetery of the monks. Though not of a particularly melancholy humour, I am in a small way given to meditation among the tombs; and in many of the countries I have visited, the burial-places of the dead have been the most interesting objects of examination. The superior had promised to show me his graves; and something in the look of the reader reminding me of death and burial, I now told the old man of his promise, and he hobbled off to get the key; for it appeared that the cemetery was not to be visited without his special permission. At the end of a long arbour of grape-vines, a narrow staircase cut in the rock, which I had not seen before, led down to an excavated square of about twenty feet; on the left of which was a small door opening into a vault, where formerly the bodies of the dead monks were laid on an iron bedstead, and there suffered to remain until all the corruptible part was gone, and only the dry bones remained. Now they are buried for about three years, or as long as may be necessary to effect the same object; and when the flesh and muscles have disappeared, the bones are deposited in the great cemetery, the door of which is directly opposite. Within the door is a small antechamber, containing a divan and a portrait of some saint who wandered eighteen years in the desert without meat or drink. From this the door opens into the cemetery, which was so different from any I had ever seen, that I started back on the threshold with surprise. Along the wall was an excavation about thirty feet in length, but of what depth I could not tell. It was enclosed by a fence, which was three or four feet above the ground, and filled with human skulls; and in front, extending along the whole width of the chamber, was a pile of bones about twenty feet high, and running back I could not tell how far. They were very regularly disposed in layers, the feet and shoulders being placed outward alternately, and by the side of the last skeleton was a vacant place for the next that should be ready.

I had seen thousands of Egyptian mummies, and the catacombs of Chioff, the holy city of Russia, where the bodies of the saints are laid in rows, in open coffins, clothed in their best apparel, and adorned with gold and jewels; and in that extraordinary burial-place I had seen, too, a range of small glasses in a dead stone wall, where wild and desperate fanatics had made their own tombs, with their own hands building themselves in an upright position against the walls, leaving a small hole open in front by which to receive their bread and water; and when they died, the small opening was closed with a piece of glass, and the body of the saint was left thus buried. I had seen the catacombs of the Capuchin convent at Syracuse, where the bodies of the monks are dried and laid in open coffins, or fixed in niches in the walls, with their names labelled on their breasts; and in the vault of the convent of Palermo I had seen the bodies of nobles and ladies, the men arranged upright along the walls, dressed as in life, with canes in their hands and swords by their sides; and the noble ladies of Palermo lying in state, their withered bodies clothed in silks and satins, and adorned with gold and jewels; and I remember one among them, who, if then living, would have been but twenty, who two years before had shone in the bright constellation of Sicilian beauty, and, lovely as a light from heaven, had led the dance in the royal palace; I saw her in the same white dress which she had worn at the ball, complete even to the white slippers, the belt around her waist, and the jewelled mockery of a watch hanging at her side, as if she had not done with time for ever; her face was bare, the skin

dry, black, and shrivelled, like burnt paper; the cheeks sunken; the rosy lips a piece of discoloured parchment; the teeth horribly projecting; the nose gone; a wreath of roses around her head, and a long tress of hair curling in each hollow eye. I had seen these things, and even these did not strike me so powerfully as the charnel-house at the convent of Mount Sinai. There was something peculiarly and terribly revolting in this promiscuous heaping together of mortal relics; bones upon bones; the old and young; wise men and fools; good men and bad; martyrs and murderers; masters and servants; bold, daring, and ambitious men—men who would have plucked bright honour from the moon—lying pell-mell with cowards and knaves. The superior told me that there were more than 30,000 skeletons in the cemetery—literally an army of dead men's bones. Besides the pile of skulls and bones, in a chamber adjoining were the bones of the archbishops, in open boxes, with their names and ages labelled on them, and those of two sons of a king of Persia, who came hither on a pilgrimage and died in the convent; their iron shirts, the only dress they wore on their long journey from their father's court, are in the same box. Other skeletons were lying about, some in baskets, and some arranged on shelves, and others tied together and hanging from the roof. In one corner were the bones of St Stephen—not the martyr who was stoned to death at Jerusalem, but some pious anchorite of later and less authentic canonization.

As to the effect upon the mind of such burial-places as this, or the catacombs to which I have referred, I can say from my own experience that they destroy altogether the feeling of solemnity with which we look upon the grave. I remember once, in walking through long rows of dead, arranged like statues in niches of the wall, I remarked to the friar who accompanied me that he promenaded every day among his old acquaintances; and he stopped and opened a box, and took out piece-meal the bones of one who, he said, had been his closest friend, and laughed as he pulled them about, and told me of the fun and jokes they two had had together.

Returning to the convent, and passing through the great chapel on the way to my room, I met one who, in the natural course of things, must soon be borne to the charnel-house I had just left. It was the aged monk of whom I have before spoken; he whose years exceeded by thirty-five the seventy allotted to man. I had desired an opportunity of speaking with him, and was curious to know the workings of his mind. The superior had told me that he had outlived every feeling and affection; that he spent all his time in prayer, and had happily arrived at a new and perfect state of innocence; and I remember, that after comparing him to the lamb, and every other emblem of purity, the good superior ended, with a simplicity that showed his own wonderful ignorance of human nature, by declaring that the old monk was as innocent as a young girl. It occurred to me that this might be a dubious comparison; but as I knew that the monastic life of the old eulogist, and his long seclusion from the world, had prevented him from acquiring any very accurate knowledge of young girls, I understood him to mean the perfection of innocence.

I looked upon the old monk with exceeding interest, as a venerable relic of the past. For more than seventy-five years he had wandered around the holy mountain, prostrating himself daily at the foot of the altar, and with three generations of men, had sung the praises of God under the hallowed peak of Sinai. I approached him, and told him my pleasure in knowing so old and holy a man, and the wonder with which his story would be heard in my own far-distant country. But the old man listened with impatience. The other monks were rather pleased when I stopped to talk with them, but he seemed anxious to get away, and stood, as I supposed, with his hand on his heart, as if pleading some religious duty as an excuse for his haste; but it turned out that he was merely complaining of the emptiness of his stomach, and was hungering for his evening meal. I was sorry to have the interesting picture I had conceived of

this monkish Methuselah marred and effaced by so matter-of-fact an incident; but I describe him as I found him, not as I would have wished him to be.

Ever since I had left Cairo, I had been troubled with misgivings touching my ability to undertake the journey by Petra. I had hoped to recruit during my few days' residence at the convent, but I was obliged to acknowledge to myself that I was, to say the least, no better. The route through Idumea was difficult and dangerous, requiring all the energy of mind and body that perfect health could give; and a wrong movement from the point where I now was might place me in a position in which the loudest cry of distress could never be heard. It was not necessary to inflict upon the reader all my hesitations; it is enough to say, that with one of the strongest efforts of resolution I was ever called upon to make, I abandoned my cherished project of visiting Petra and the land of Idumea; and, with a heavy heart, wrote to Mr Gliddon that I was a broken reed, and was bound on the safe and direct road to Gaza. My kind friend the superior would not hear of me leaving the convent; but I resisted his importunities, and laughingly told him I did not like that unchristian way of burial, cutting up and piling away a man's bones like sticks of firewood to dry. Finding me resolved, he took me to his room, and gave me from his little store of treasures some shells and petrifications (which I threw away when out of his sight), engravings of Mount Sinai, and incidents of which it has been the scene, the rudest and most uncouth conceptions that ever were imagined, and a small box of manna, the same, as he religiously believed, which fed the Israelites during their sojourn in the wilderness. He gave me, too, a long letter, written in modern Greek, and directed to the governor of Gaza, certifying that I was a pilgrim from America; that I had performed all the duties of the pilgrimage, and was now travelling to the holy city of Jerusalem. The letter contained, also, a warm and earnest recommendation to all the Greek convents in the Holy Land to receive and comfort, feed and clothe, and help and succour me, in case of need. Last of all, he put on my finger a ring of the simplest form and substance, and worthy to accompany the palmer's staff of an older age. Every pilgrim to Mount Sinai receives one of these rings; and like the green turban of the Mussulman, which distinguishes the devout hadji who has been to Mecca, among the Christians of the East it is the honoured token of a complete and perfect pilgrimage.

At eight o'clock in the morning the whole convent was in commotion, preparing for my departure. My old Bedouin guide had been out among his tribe, and arrived the night before with three times as many men and camels as I wanted, ready to conduct me to Akaba or Gaza. I took my leave of the holy brotherhood, who now sped me on my way as kindly and warmly as they had welcomed me on my arrival; and, after a long and most affectionate parting with the good old superior, who told me that in all probability he should never see me again, but should always remember me, and begged me not to forget him—assuring me that there in the desert I always had a home, and telling me that if, when I returned to my own country, misfortune should press upon me, and I should find my kindred gone and friends standing aloof, I must shake the dust from off my feet, and come back and live with him in the wilderness—I fastened the rope around me, and was let down for the last time to the foot of the convent-wall. A group of Bedouins, heggars, and dependents upon the charity of the convent, gathered around, and invoked blessings upon me as I started. Twice since my arrival there had been rain. In that dry and thirsty desert, every drop of water falls upon the earth like precious ointment, and "welcome," says the Arab, "is the stranger who brings us rain."

I turned my back upon the rising sun, and felt by comparison on my homeward way; but a long journey was still before me. I had still to cross "the great and terrible desert" of the Bible, which spread before the wandering Israelites its dreary and eternal sands, from the base of Sinai to the Promised Land.

## CHAPTER XVIII.

The Caravan.—A sudden Change of Purpose.—Perils of a Storm.

—Comfortless Repentance.—Solitude.—A Woman and a Chase.

—A Patriarchal Feast.—Condition of the Arab Women.—Hospitality.—No refusing a good Offer.—A Dilemma.

My caravan consisted of five camels, four Arabs, Paul, and myself. We moved silently down the valley, and I tried hard to fasten my thoughts on Gaza, the strong city of the Philistines, the city of Delilah and Samson, and to amuse my discontented spirit with imagining the gates which he carried away, and the temple which he pulled down; but it would not do—Petra, the rock of Edom, the excavated city, was uppermost in my mind. We had been marching in perfect silence about four hours, and I was sitting carelessly on my dromedary, thinking of every thing but what I saw, when Toualeb pointed to a narrow opening in the mountain as the road to Akaba. I raised my head unconsciously, and it struck me, all of a sudden, that I was perfectly recovered, and fit for any journey. It was a day such as can only be seen in the mountainous desert of Arabia, presenting a clearness and purity in the atmosphere, and a gentle freshness in the air, which might almost bring to life a dying man. I stretched myself and brandished my Nubian club; my arm seemed nerved with uncommon vigour; I rose in my saddle strong as the slayer of the Philistines, and, turning the head of my dromedary towards the opening in the mountains, called out briefly and decidedly, to "Akaba and Petra." Paul was astonished; he took the pipe from his mouth, and for a moment paused; then knocking out the ashes, he slipped from his dromedary and ran up to the side of mine, looking up in my face with an expression of countenance that seemed to intimate strong suspicions of my sanity. After gazing at me as steadfastly as he could without being impertinent, he went away, still apparently in doubt, and I soon saw him following with Toualeb, in earnest conversation. Toualeb was even more astonished than Paul. The Arabs are not used to any of these mercurial changes of humour; and, according to their notion, if a man sets out for Gaza, he must go to Gaza: they cannot conceive how one in his right reason can change his mind; and Toualeb would have been very easily persuaded that an evil spirit was hurrying me on, particularly as, like Paul, from the beginning he had opposed my going by Petra and Idumea. Finding me resolute, however, he soon began to run, and brought back the camels, which were some distance in advance, and for several hours we moved on in perfect silence through the wild and rugged defile.

The mountains on each side were high, broken, and rugged, and ever presenting the same appearance of extreme old age. The road, if road it might be called, was rougher than any I had yet travelled; it was the only opening among the mountains by which we could pass at all, made, by the hand of Nature, and so encumbered with fallen rocks that it was exceedingly difficult for our camels to advance. I did not intend to push far that day; and a little before dark I proposed to encamp in a narrow pass between the mountains, where there was barely room to pitch our tents; but appearances threatened rain, and Toualeb, pointing to the accumulation of stones and rocks which had fallen from the mountain and been washed through the pass, told me it would be a dangerous place to spend the night in. There was no earth to drink the falling rain, and, pouring down the hard and naked mountain sides, it formed a torrent in the pass, which hurried and dashed along, gathering force at every moment, and carrying with it bodies of sand and stones that would have crushed to atoms any obstruction they might meet in their resistless progress. I felt at once the force of the suggestion; and as I had no idea of being disturbed in the night by such a knock at the door of my tent as one of these gigantic missiles would have made, we kept on our difficult way. At dark we were still in the ravine. Toualeb was right in his apprehensions; for some time before we reached the end of the pass the rain was falling in torrents, the rocks and stones were washing

under our feet, and we heard the loud roar of thunder, and saw the forked lightning play among the mountain-tops. It was two hours after dark before we reached a place where it was prudent to encamp. We pitched our tent in the open valley; the thunder was rumbling, and ever and anon bursting with a terrific crash among the riven mountains, and the red lightning was flashing around the hoary head of Sinai. It was a scene for a poet or painter; but, under the circumstances, I would have given all its sublimity for a pair of dry pantaloons. Thunder and lightning among mountains are exceedingly sublime, and excellent things to talk about in a ball-room or by the fireside; but my word for it, a man travelling in the desert has other things to think of. Every thing is wet and sloppy; the wind catches under his tent before he can get it pinned down; and when it is fastened, and he finds his tight canvass turning the water like a cemented roof, and begins to rub his hands and feel himself comfortable, he finds but the beginning of trouble in a wet mat and coverlet.

I was but poorly prepared for a change like this, for I had been so long used to a clear, unclouded sky, that I almost considered myself beyond the reach of the changing elements. It was the beauty of the weather more than any thing else that had tempted me to turn off from the road to Gaza; and, hardly equal to this change of scene, my heart almost sank within me. I reproached myself as if for a wilful and unjustifiable disregard of prudence, and no writer on moral duties could have written a better lecture than I inflicted upon myself that evening. In wet clothes, I was literally sitting on the stool of repentance. Drooping and disheartened, I told Paul that I was already punished for my temerity, and the next morning I would go back and resume the road to Gaza. For the night, however, there was but one thing to be done, and that was to sleep if I could, and sleep I did. A man who rides all day upon a dromedary must sleep, come what may, and even thunder among the mountains of Sinai cannot wake him. Daylight brought back my courage; the storm was over; the sun was shining brightly as I ever saw it even in the East; and again there was the same clear and refreshing atmosphere that had beguiled me from my prudent resolution. I, too, was changed again; and in answer to the suggestion of Paul, that we should retrace our steps, I pointed towards Akaba, and gave the brief and emphatic order—"Forward!"

We continued for several hours along the valley, which was closely bounded on either side by mountains, not high, but bare, cracked, and crumbling into fragments. The tops had apparently once been lofty and pointed, but time, and the action of the elements, had changed their character. The summits had crumbled and fallen, so as to expose on every side a rounded surface, and the idea constantly present to my mind was, that the whole range had been shaken by an Almighty hand—shaken so as to break the rugged surface of the mountains, but not with sufficient force to dash them into pieces; I could not help thinking that, with another shock, the whole mass would fall in ruins. I had often remarked the silence and stillness of the desert; but never had I been so forcibly impressed with this peculiarity as since I left the convent. The idea was constantly present to my mind, "How still, how almost fearfully still!" The mountains were bare of verdure; there were no shrubs or bushes, and no rustling of the wind, and the quiet was like that of the ocean in a perfect calm, when there is not a breath of air to curl a wave or shake the smallest fold in the lazy sail that hangs useless from the yard. Occasionally we disturbed a hare or a partridge, but we had not met a human being since we left the convent. Once we saw the track of a solitary dromedary, the prints of his feet deeply bedded in the sand, as if urged by one hurrying with hot haste; perhaps some Bedouin robber flying to his tent among the mountains with the plunder of some desert victim. We followed it for more than an hour, and when we lost sight of it on the rocky road, I felt as if we were more lonely than before.

I was thinking what an incident it would be in the life of one used to the hurrying bustle of steam-boats and rail-roads, to travel for days through this oldest of countries without meeting a living being; and as far as I could understand, it might well be so; and there was no trade even for small caravans, and years passed by without any person, even an Arab, travelling this road. Toualeb had been over it but once, and that was ten years before, when he accompanied M. Laborde on his way to Petra. I knew that there were Bedouin tents among the mountains, but, unless by accident, we might pass through without seeing any of them; and I was speculating on the chances of our not meeting a single creature, when Paul cried out that he saw a woman; and soon after repeating the exclamation, dismounted and gave chase. Toualeb ran after him, and in another moment or two I caught a glimpse and followed.

I have before mentioned that, among these barren and desolate mountains, there was frequently a small space of ground, near some fountain or deposit of water, known only to the Arabs, capable of producing a scanty crop of grass to pasture a few camels and a small flock of sheep or goats. There the Bedouin pitches his tent, and remains till the scanty product is consumed; and then packs up his household goods, and seeks another pasture-ground. The Bedouins are essentially a pastoral people; their only riches are their flocks and herds, their home is in the wide desert, and they have no local attachments; to-day they pitch their tent among the mountains, to-morrow in the plain; and wherever they plant themselves for the time, all that they have on earth, wife, children, and friends, are immediately around them. In fact, the life of the Bedouin, his appearance and habits, are precisely the same as those of the patriarchs of old. Abraham himself, the first of the patriarchs, was a Bedouin, and 4000 years have not made the slightest alteration in the character and habits of this extraordinary people. Read of the patriarchs in the Bible, and it is the best description you can have of pastoral life in the East at the present day.

The woman whom we had pursued belonged to the tent of a Bedouin not far from our road, but completely hidden from our view; and when overtaken by Toualeb, she recognised in him a friend of her tribe, and in the same spirit, and almost in the same words which would have been used by her ancestors 4000 years ago, she asked us to her tent, and promised us a lamb or a kid for supper. Her husband was stretched on the ground in front of his tent, and welcomed us with an air and manner that belonged to the desert, but which a king on his throne could not have excelled. He was the embodied personification of all my conceptions of a patriarch. A large loose frock, a striped handkerchief on his head, bare legs, sandals on his feet, and a long white beard, formed the outward man. Almost immediately after we were seated, he took his shepherd's crook, and, assisted by his son, selected a lamb from the flock for the evening meal; and now I would fain prolong the illusion of this pastoral scene. To stop at the door of an Arab's tent, and partake with him of a lamb or kid prepared by his hospitable hands, all sitting together on the ground, and provided with no other implements than those which Nature gave us, is a picture of primitive and captivating simplicity; but the details were such as to destroy for ever all its poetry, and take away all relish for patriarchal feasts. While we were taking coffee, the lamb lay bleating in our ears, as if conscious of its coming fate. The coffee drunk, and the pipe smoked, our host arose and laid his hand upon the victim; the long sword which he wore over his shoulder was quickly drawn; one man held the head, and another the hind legs; and, with a rapidity almost inconceivable, it was killed and dressed, and its smoking entrails, yet curling with life, were broiling on the fire.

I was the guest of the evening, and had no reason to complain of the civility of my entertainer; for, with the air of a well-bred host, and an epicure to boot, he drew from the burning coals one of the daintiest pieces, about a yard and a half in length, and rolling one end between

the palms of his hands to a tapering point, broke off about a foot and handed it to me. Now I was by no means dainty. I could live upon the coarsest fare, and all the little luxuries of tables, knives and forks, were of very little moment in my estimation. I was prepared to go full length in this patriarchal feast. But my indifference was not proof against the convivial elegances of my companions; and as I saw yard after yard disappear, like long strings of macaroni, down their capacious throats, I was cured of all poetical associations and my appetite together.

In the tent of the Arabian patriarch, woman, the pride, the ornament, and the charm of domestic life, is the mere household drudge. In vain may one listen for her light footstep, or look to find her by the side of her natural lord, giving a richer charm to the hospitality he is extending to a stranger. It would repay one for much of the toil and monotony of a journey in the desert, if, when by chance he found himself at a Bedouin tent, he could be greeted by her sunny smile. Dark and swarthy as she is, and poor and ignorant, it would pay the traveller for many a weary hour to receive his welcome from the lips of an Arabian girl. But this the customs of the tribes forbid. When the stranger approaches, the woman retires; and so completely is she accustomed to this seclusion, that, however closely he may watch, he can never catch her even peeping at him from behind a screen or partition of the tent; curiosity, which in civilised life is so universally imputed to the daughters of Eve, seems entirely unknown to the sex in this wild region. Nor is this the worst of her lot. Even when alone, the wife of the Bedouin is not regarded as his equal; the holy companionship of wedded life has between them no existence. Even when no guest is present, she never eats with him. I have seen the father and sons sit down together, and when they had withdrawn from the tent, the mother and daughters came in to what was left. Away, then, with all dreams of superior happiness in this more primitive condition of society. Captivating as is the wild idea of roving abroad at will, unfettered by the restraints of law or of conventional observances, the meanest tenant of a log-hut in our western prairies has sources of happiness which the wandering Arab can never know. A spirit of perfect weariness and dissatisfaction with the world might drive a man to the desert, and, after having fallen into the indolent and mere animal habits of savage life, he might find it difficult to return to the wholesome restraints and duties of society; but I am satisfied that it is sheer affectation or ignorance in which a member of the civilised family sighs, or pretends to sigh, for the imagined delights of an untried freedom. For my own part, I had long been satisfied of this truth, and did not need the cumulative evidence of my visit to the Bedouin's tent. He would have had me sleep under its shelter; but I knew that in all the Bedouin tents there were multitudes of enemies to rest—creatures that murder sleep; and I preferred the solitude of my own.

One word as to the hospitality of the Arabs. I had read beautiful descriptions of its manifestation, and in some way or other had gathered up the notion that the Bedouin would be offended by an offer to reward his hospitality with a price; but, feeling naturally anxious not to make a blunder on either side of a question so delicate, I applied to my guide Toualeb for information on the subject. His answer was brief and explicit. He said there was no obligation to give or pay, it being the custom of the Bedouins (among friendly tribes) to ask the wayfarer man into his tent, give him food and shelter, and send him on his way in the morning; that I could give or not, as I pleased; but that, if I did not, the hospitable host would wish his lamb alive again; and from the exceeding satisfaction with which that estimable person received my parting gift, I am very sure that in this instance, at least, I did better in taking Toualeb's knowledge of his people for my guide than I should have done by acting upon what I had read in books. It may be that, if I had gone among them poor and friendless, I should have been received in the same

manner, and nothing would have been expected or received from me; but I am inclined to think, from what I saw afterwards, that in such case the lamb would have been spared for a longer term of existence, and the hospitality confined to a dip into the dish and a mat at the door of the tent.

Early in the morning we left the tent of our Bedouin landlord. We were still among mountains; at every moment a new view presented itself, wild, fanciful, and picturesque; and in the distance was still visible the long range of dark mountains bordering the Red Sea. Our course was now directly for this sea, but the mountain range appeared so contiguous and unbroken that there seemed no way of getting to it but by crossing their rugged summits. There was a way, however; an opening which we could not distinguish at so great a distance, and for some time Toualeb was at a loss. He was so purblind that he could scarcely distinguish me from one of his dark companions, yet he could read the firmament like a book, and mark the proportions of the almost shapeless mountains; but he was uncertain how to hit precisely the opening by which we must pass through. There was no danger of our losing ourselves, and the only hazard was that of wasting a day in the search; but, fortunately, at the commencement of our perplexity, we came upon a Bedouin whose tent was at the foot of the mountain; and, under his instructions, we pushed on with confidence and ultimate success.

## CHAPTER XIX.

Evening Amusements.—A Trial of the Feelings.—A Disappointment.—A Santon of the Desert.—An Arab Fisherman.—Turkish Costume.—A potent Official.—A Comfortless Sick-room.—A Visit from the Sheik.—Interested Friendship.—Akaba.—The El Alouins.—Questionable Piety.

It was late in the afternoon when our little caravan entered the narrow opening, presenting itself like a natural door between precipitous rocks several hundred feet in height. Passing this, and continuing onward to a vast amphitheatre, or hollow square of lofty rocks through a larger opening on our left, we again saw the dark waters of the Red Sea. About midway across I dismounted from my dromedary to survey the scene around me; and among the many of high interest presented to the traveller in the wilderness of Sinai, I remember none more striking and impressive. It was neither so dreary and desolate, nor so wild and terrible, as others I had seen, but different from all. The door by which we entered was undistinguishable, the rocks in the background completely closing it to the sight; on all sides except towards the sea, and forming almost a perfect square, were the naked faces of the rock, lofty, smooth, and regular, like the excavated sides of an ancient quarry, and quiet to that extraordinary and indescribable degree of which I have already spoken. Descending towards the opening that led to the sea, directly under us was an extensive and sandy plain, reaching to its very margin; and nearly opposite, rising abruptly from the clear waters, a long unbroken range of steep and rugged mountains, their dark irregular outline finely contrasted with the level surface at their feet, while the sea itself extended on the right and left as far as the eye could reach in that clear atmosphere; but the first stage of my journey, the head of the gulf, and the little fortress of Akaba, were still invisible.

We rode about an hour along the shore, passing at a distance the tents of some Bedouins; and about an hour before dark, encamped in a grove of wild palm-trees, so near the sea that the waves almost reached the door of my tent. When the moon rose, I walked for an hour along the shore, and, musing upon the new scenes which every day was presenting me, picked up some shells and bits of coral as memorials of the place. I am no stargazer, but I had learned to look up at the stars; and though I knew most of them merely by sight, I felt an attraction towards them as faces I had seen at home;

while the Great Bear with his pointers, and the North Star, seemed my particular friends.

Returning to my tent, I found my Bedouins, with some strangers from the tents which we had passed, sitting round a fire of the branches of palm-trees, smoking, and telling stories as extravagant as any in the Arabian Nights' Entertainments. I sat down with them a few moments, then entered my tent, and lay down on my mat on the very shore of the sea, and was lulled to sleep by the gentle murmur of its waters.

In the morning Paul told me that there was a strange Arab outside, who wanted to see me. When we first came down from the mountain on the preceding day, a Bedouin had come out and requested me to turn aside and visit a sick man in his tent. In their perfect ignorance of the healing art, the Arabs believe every stranger to be a hakim; and so great is their confidence in the virtue of medicine, and so great their indifference to the hands from which they receive it, that the path of the traveller is constantly beset with applications from the sick or their friends. I had been so often besought and entreated to cure blindness, deafness, and other maladies beyond even the reach of medical skill, that now I paid little attention to such applications; and when this last request was made, after inquiring into the symptoms of the case, I told the messenger that I could do the sick man no good, and passed on. This morning Paul told me that the patient himself had come over during the night, and was then at the door, begging me to cure him. Paul had told him of my utter inability, but he would not be satisfied; and when I went out of my tent, he was sitting directly before the door, a thin, ghastly figure; and opening his mouth and attempting an inarticulate jabber, there fell out a tongue so festered to the very throat, that the sight of it made me sick. I told him that it was utterly out of my power to help him; that I knew no more of the healing art than he did himself; and that the only advice I could give him was to endeavour to get to Cairo, and put himself under the hands of a physician. I shall never forget the poor fellow's look, and almost blamed myself for not giving him some simple preparation, which might have cheated him, at least for a few days, with the hope that he might escape the tomb to which he was hurrying. His hands fell lifeless by his side, as if he had heard a sentence of death; he gave me a look which seemed to say that it was all my fault, and fell senseless on the ground. His two companions lifted him up; his faithful dromedary knelt to receive him; and as he turned away, he cast a reproachful glance towards me, which made me almost imagine myself guilty of his death. I have no doubt that, long before this, the poor Arab is dead, and that in his dying moments, when struggling with the king of terrors, he has seen in his distracted visions the figure of the hard-hearted stranger, who, as he thought, might have saved him, but would not.

Anxious to escape an object so painful to my feelings, I walked on, and was soon busily engaged in picking up shells and coral; of the former I never saw so many as at this place. Some were particularly beautiful, but exceedingly delicate, and difficult to be carried. The first day I could have loaded a camel with them. The coral, too, such as it was, lay scattered about in lavish profusion. I remember, the first piece Paul found, he rubbed his hands like the toiling and untiring alchemist when he thinks he has discovered the philosopher's stone; but when he came to a second, he threw away the first, in the same spirit in which the Irishman, on his arrival in America, the El Dorado of his dreams, threw down a sixpence which he had picked up in the street, assuring himself that there was more where that came from. Some of this coral was exceedingly beautiful; we did not know its value, but I did not think very highly of it merely from the circumstance of its lying there in such abundance. It was not the rock or branch coral, but a light porous substance, resembling very much the honeycomb. Paul gathered a large quantity of it, and contrived to carry it to Jerusalem, though it got very much broken on the way. He had the satisfaction of

knowing, however, that he had not sustained any great loss; for, on our first visit to the Church of the Holy Sepulchre, we found in the porch a green-turbaned Mussulman, who, returning from his pilgrimage to Mecca, had thought to indemnify himself for the expense and fatigue of his long and dreary journey with this treasure of the sea. Paul took up a large piece and asked him the price, when the Mussulman, with an air as dejected in telling as was that of Paul in hearing it, told him two paras, a para being about one-eighth of a cent; and the next day I saw before the door of the convent at which we were staying a large heap of the coral which Paul had been so careful in carrying; and after that he talked only of his shells, the value of which was not yet ascertained.

At about twelve o'clock, close by the shore, we came to a stunted wild palm-tree, with a small stone fence around it; and looking down from my dromedary, I saw extended on the ground the figure of an Arab. I at first thought he was dead; but at the noise of our approach, he raised his head from a stone which served him as a pillow, and the first greeting he gave us was to ask for bread. Among all the habitations of hermits I had yet seen, in caves, among rocks or mountains, there was none which could be compared with this by the shore of the sea; a small fence, but little higher than his recumbent body, protected him from the wind; the withered branches of the palm-tree were his only covering; his pillow a stone, and the bare earth his bed; and when he crawled out and stood before us, erect as age and infirmity would allow, I thought I had never seen such a miserable figure. I could not have believed, without seeing it, that any thing so wretched, made in God's image, existed on the earth. He was more than sixty; his face was dried, and seamed with the deep wrinkles of age and exposure; his beard long and white, and his body thin to emaciation. Over his shoulders and breast was a miserable covering of rags, but the rest of his body was perfectly naked: his skin was dry, horny, and covered with blotches resembling large scales, which, on his legs, and particularly over his knees, stood out like the gravies of an ancient coat of mail; and he looked like one who literally crawled on his belly and looked the dust of the earth. He reminded me of the wild hermit of Engaddi, who came out upon the Saracen emir when he journeyed with the Knight of the Leopard on the shore of the Dead Sea. And this man was a saint, and my Arabs looked on him with respect and reverence; and when he died, a public tomb would be erected over him, and they upon whose charity he now lived would resort to it as a shrine of prayer. We gave him some bread, and left him in his solitary den; and before we had got out of sight, he had crawled back under his palm-leaves, and was again resting upon his pillow of stone. In our busy and stirring world, we cannot imagine the possibility of existing in such a dromish state; but in all probability that man would lie there till the bread he gave him was exhausted, and when he had taken his last morsel, again lie down in hope that more would come.

About an hour afterwards we came upon a fisherman stealing along the shore with his net in his hand, looking into the sea, and ready to throw it when he saw any fish. The process, like every thing else that one sees here, is perfectly primitive, and carries the beholder back to the early days of this ancient country. Carrying the net on his left arm crooked, cleared and prepared for a throw, with the one end in his right hand, and taking advantage of ripples made by the wind, and the sun throwing his shadow behind him, he runs along the shore until he sees a shoal of fish, when, with a gentle jerk, and without any noise, he throws his net, which opens and spreads as it falls, so that a little thing, which could be put easily into a hat, expands sufficiently to cover a surface of twenty or thirty feet. While running along with us, he threw several times; and as he managed his craft with skill, never throwing until he saw something, he was always successful. I could not make any thing out of the Arabic name of the fish, but I have

the flavour of them still on my tongue; a flavour at the moment finer than that of the sole or turbot of Paris, or the trout of Long Island.

In the afternoon the weather changed. Since we first struck the sea, our road along its shore had been one of uncommon beauty, and my time passed very pleasantly, sometimes allowing my dromedary to cool his feet in the clear water, sometimes dismounting to pick up a shell, and all the time having a warm sun and a refreshing breeze; but it was my fortune to see this ancient country under every hue of the changing elements. The sun was now obscured; a strong wind came down the sea directly in our teeth; the head of the gulf was cut off from our view; the sea was troubled, and the white caps were dancing on its surface; the dark mountains looked darker and more lonely; while before us a rainbow was forming over the point of Akaba, which threw itself across the gulf to the east, marking in the firmament, with its rich and varied colours, the figure of the crescent. Soon after, we were in the midst of a perfect hurricane. Several times during the day I had wished to float upon the bosom of the tranquil sea, and had looked in vain for some boat or fisherman's skiff to carry me up the gulf; but I now shrank from the angry face of the deep, and, under the shelter of an impending rock, listened to the fierce whistling of the wind, and the crashing of the thunder among the mountains.

In the morning the storm was over, and the atmosphere pure, clear, and refreshing as before; but as a set-off to the pleasure of returning sunshine, Toualeb told me that we had passed the boundaries of the friendly tribes, and that we must look to our weapons, for we were now among strangers, and perhaps enemies. Here, too, for the first time, I put on my Turkish dress, being that of a merchant of Cairo, with the addition of pistols and sabre; but, fearful of taking cold, I cut down an old coat and tied up a pair of pantaloons, so as to have a complete suit under the large white trousers and red silk gown which formed the principal items of my dress. The red turban I had worn ever since I had been in Egypt; but I now rolled round it a green and yellow striped handkerchief, to which Toualeb gave the proper twist; and, with my yellow slippers and red shoes over them, sash, pistols, sword, and long beard, I received the congratulations and compliments of my friends upon my improved appearance.

Indeed, I played the Turk well. Different from my notions of the appearance of the Turks, they have generally light and florid complexions; and if I could have talked their language, dressed as a Turk, they could not have judged from my appearance that I had ever been outside the walls of old Stamboul. There is no exaggeration in the unanimous reports of travellers of the effect which the costumes of the East give to personal appearance; and having seen and known it even in my own person, I am inclined to believe that there is fallacy in the equally prevalent opinion of the personal beauty of the Turks. Their dress completely hides all deformity of person, and the variety of colours, the arms and the long beard, divert the attention of the observer from a close examination of features. The striking effect of costume is strongly perceptible in the soldiers of the sultan, and the mongrel, half European uniform in which he has put them, and which they are not by any means an uncommonly fine-looking set of men. These soldiers are taken wherever they are caught, and, consequently, are a fair specimen of the Turkish race; and any English regiment will turn out finer men than the best in the sultan's army. Following my example, Paul also slipped into his Bedouin shirt, and could hardly be distinguished from the best Arab of them all.

Again our road lay along the shore, so near that sometimes we had to dismount and pick our way over the rocks, and at others our dromedaries bathed their feet in the water. In one place the side of the mountain rose so directly and abruptly from the water's edge, that we had to turn aside and pass around it, coming again to the shore after about an hour's ride. Here we saw

the gulf narrowing towards its extremity; and on the opposite side a cluster of palm-trees, within which, and completely hidden from view, was the end of our first stage, the fortress of Akaba. Never was the sight of one of the dearest objects on earth, home to the wanderer, land to the sailor, or a mistress to the lover, more welcome than the sight of those palm-trees to me. The malady under which I had been labouring had grown upon me every day; and in spite of all that was rich and interesting, time after time I had regretted my rashness in throwing myself so far into the desert. The repose, therefore, which awaited me at Akaba, seemed the most precious thing on earth.

Towards evening we could see Akaba more distinctly, though still on the opposite side of the gulf, and still at a formidable distance to me. A brisk trot would have carried me there in an hour; but this was more than I could bear, supported as I was by a mattress on each side of me, and barely able to sustain the slow and measured movement of a walk. Night was again coming on, and heavy clouds were gathering in the east. I was extremely anxious to sleep within the fortress that night; and fearful that a stranger would not be admitted after dark, I sent Paul ahead with my compliments to the governor, and the modest request that he would keep the gates open till I came.

A governor is a governor all the world over. Honour and respect attend him wherever he may be; whether the almost regal governor-general of India, the untitled chief magistrate of our own democratic state, or the governor of a little fortress on the shore of the Red Sea. But there are some governors one may take a liberty with, and others not; and of the former class was my friend of Akaba. His name was Suliman, his title aga, and therefore he was called Suliman Aga. He had his appointment by favour of the pacha, and permission to retain it by favour of the Bedouins around; he had under him nominally a garrison of Mogrebbin soldiers, but they were as restive as some of our own unbroken militia; and like many a worthy disciplinarian among us, he could do just as he pleased with them, if he only let them have their own way. He was, in short, an excellent governor, and I gave him two dollars and a recommendation at parting.

But I am going too fast. I arrived before dark, and in such a state that I almost fell from my dromedary in dismounting at the gate of the fortress. The first glance told me that this was not the place of rest I had promised myself. Half a dozen Mogrebbin from the shores of Morocco, the most tried and faithful of the hired troops of the pacha, were sitting on a mat within the gate, smoking their long pipes, with their long guns, swords, and pistols, hanging above their heads. They rose and gave me a seat beside them, and the whole of the little population of the fortress, and the Bedouins living under the palm-trees outside, gathered around to gaze at the stranger. The great caravan of pilgrims from Mecca had left them only three days before; and, except upon the passing and return of the caravan, years pass by without a stranger ever appearing at the fortress. They had heard of my coming, for the sheik had waited two days after the departure of the caravan, and had only gone that morning, leaving directions with the governor to send for him as soon as I arrived. I was somewhat surprised at his confidence in my coming, for when I saw him, I was very far from being decided; but in the miserable condition in which I found myself, I hailed it as a favourable omen. The governor soon came, and was profuse in his offers of service, beginning, of course, with coffee and a pipe, which I was forced to decline, apologising on the ground of my extreme indisposition, and begged to be conducted to a room by myself. The governor rose and conducted me, and every Bedouin present followed after; and when I came to the room by myself, I had at least forty of them around me. Once Paul prevailed on some of them to go out; but they soon came back again, and I was too ill to urge the matter.

The very aspect of the room into which I was shown

prostrated the last remains of my physical strength. It was 80 or 100 feet long, 40 feet wide, and about as many high, having on one side a dead wall, being that of the fortress, and on the other, two large windows without shutters, and the door; the naked floor was of mud, and so were the walls and ceiling. I looked for one spot less cheerless than the rest; and finding at the upper end a place where the floor was elevated about a foot, with a feeling of despondency I have seldom known, I stretched my mattress in the extreme corner, and, too far gone to have any regard to the presence of the governor or his Arab soldiers, threw myself at full length upon it. I was sick in body and soul; for besides the actual and prostrating debility under which I was labouring, I had before me the horrible certainty that I was completely cut off from all medical aid, and from all the comforts which a sick man wants. I was ten days from Cairo; to go there in person was impossible; and if I should send, I could not obtain the aid of a physician in less than twenty-five or thirty days, if at all; and before that I might be past his help. When I left Cairo, Dr Walne had set me up, so that I held out tolerably well until I reached Mount Sinai; and, moreover, had given me sundry medicines, with directions for their use under particular circumstances; but my symptoms had so completely changed, that the directions, if not the medicines themselves, were entirely useless. In a spirit of desperation, however, I took them out, and not knowing where to begin, resolved to go through the whole catalogue in such order as chance might direct. I began with a double dose of cathartic powders, and while lying on my mat, I was diverted from the misery of my own gloomy reflections by the pious conversation of the Mussulman governor. If God willed, he said, I would soon get well; himself and his wife had been ill three months, and had no physician, but God willed that they should recover, and they did; and as I looked in his believing face and those of the Bedouins, I found myself gradually falling into the fatalism of their creed. I shall never forget the manner in which I passed that night, and the sombre fancies that chased each other through my brain. A single lamp threw a dim and feeble light through the large apartment, scarcely revealing the dusky forms of the sleeping Bedouins, with their weapons by their sides, and I was the only one awake. Busy memory called up all the considerations that ought to have prevented my taking such a journey, and the warning voice of my friend at Cairo, "Turn your steps westward," again rang in my ears. I saw the figure of the dead Tartar at Suez, like me a wanderer from home, and buried by strangers in the sandy desert; and so nervous and desponding had I become, that the words of the prophet in regard to the land of Idumea, "None shall pass through it for ever and ever," struck upon my heart like a funeral knell. I was now upon the borders of Edom; and, in the despondency of sickness, I looked upon myself as rash and impious, in undertaking what might be considered a defiance of the prophetic denunciations inspired by God himself.

In the morning I was worse; and following up my almost desperate plan of treatment, commenced the day with a double emetic. The governor came in; and though I tried to keep the door shut, another and another followed, till my room was as public as any part of the fortress. Indeed, it was by far the most public, for all the rest was stripped of its bronzed figures to ornament my room. Annoyed to death by seeing twenty or thirty pairs of fiery black eyes constantly fixed upon me, I remembered, with feelings of envy, my tent in the desert. There I could at least be alone, and I resolved, at all hazards, not to pass another night in the fortress.

In the midst of my exceeding perplexities, the sheik of Akaba, my friend of Cairo, made his appearance. I was in a pitiable condition when he entered, under the immediate operation of my emetic, with the whole of the Mogrebbin guard and every beggarly Bedouin about the fortress staring at me. He looked surprised and

startled when he saw me; but with a glimmering of good sense, though, as I thought, with unnecessary harshness, told me that I would die if I staid there, and that he was ready to set out with me at a moment's notice. By the advice of Mr Gliddon, my plan had been to make this my place of negotiation and arrangement, and not to proceed farther without having all things definitely explained and settled. But I was in no condition to negotiate, and was ready to do any thing to get away from the fortress. He was exceedingly anxious to start immediately, and gave me a piece of information that almost lifted me from the ground—namely, that he could provide me with a horse of the best blood of Arabia for the whole of the journey. He could not have given me more grateful intelligence, for the bare idea of again mounting my dromedary deprived me of all energy and strength. I had endeavoured to procure a sort of palanquin, to be swung between two camels; but so destitute was the fortress of all kinds of material, that it was impossible to make it. When he spoke to me, then, of a horse, it made me a new man; and, without a moment's hesitation, I told him that if he would give me till five o'clock in the afternoon, I would be ready to set out with him. One thing I did not like. I wished and designed to take with me my faithful Toualeb; but he had told me that he did not believe that the El Alouins would allow it; and when he spoke to the sheik, the latter had positively refused, pretending that all was arranged between us at Cairo. I was fain, therefore, to abandon the idea, not having energy to insist upon any thing that was disputed, and to trust every thing to fortune and the sheik. I told Paul to do all that was necessary; and begging to be left alone for a few hours, I laid myself down upon my mat, and, worn out with the watching of the last night, and the excitement of thinking and deciding on my future movements, quickly fell asleep.

At five o'clock the sheik returned, punctual to his appointment; I had slept soundly, and awoke somewhat refreshed. The room was again filled with the Bedouins, and I was as ready to go as he was to take me. He had ordered what was necessary upon the journey for man and beast, and provisions for six camels and ten men for ten days. I gave Paul my purse, and told him to pay, and, walking to the gate of the fortress, a dozen Arabs helped me to my saddle; they would have taken me up in their arms and carried me, and, when I had mounted, they would have taken up the horse and carried him too, so great a friendship had they already conceived for me. But the friendship was not for what I was, but for what I had. They had welcomed me as they would have welcomed a bag of gold; and I had scarcely mounted before they all, governor, Mogrebbin soldiers, and Bedouins, began to clamour for bucksheesh. Ten years before, M. Laborde had passed along this route, and stopped at the fortress while waiting for the sheik who was to guide and protect him to Petra; and having in view the purpose of preparing the great work which has since given him such merited reputation, he had scattered money and presents with a most liberal hand. M. Laborde himself was not personally known to any of those now at the fortress; but his companion, Mr Linant, of whom I have before spoken, was known to them all; and they all had heard of the gold shower in which M. Laborde appeared among them. They therefore expected the same from me; and when Paul had got through his distribution, I was startled at perceiving the dissatisfied air with which they received a bucksheesh that would have overwhelmed any other Arabs with joy and gratitude.

But I must not hurry the reader from Akaba with the same eagerness which I displayed in leaving it. This little fortress is seldom visited by travellers, and it is worth a brief description. It stands at the extremity of the eastern or Elicanic branch of the Red Sea, at the foot of the sandstone mountains, near the shore, and almost buried in a grove of palm-trees, the only living things in that region of barren sands. It is the last stopping-place of the caravan of pilgrims on

its way to Mecca, being yet thirty days' journey from the tomb of the Prophet, and, of course, the first at which they touch on their return. Except at the time of these two visits, the place is desolate from the beginning of the year to its close; the arrival of a traveller is of exceedingly rare occurrence, and seldom does even the wandering Bedouin stop within its walls; no ship rides in its harbour, and not even a solitary fishing-boat breaks the stillness of the water at its feet. But it was not always so desolate, for this was the Ezion-geber of the Bible, where, 3000 years ago, King Solomon made a navy of ships, which brought from Ophir gold and precious stones for the great temple at Jerusalem; and again, at a later day, a great city existed here, through which, at this distant point of the wilderness, the wealth of India was conveyed to imperial Rome. But all these are gone, and there are no relics or monuments to tell of former greatness; like the ships which once floated in the harbour, all have passed away. Still, ruined and desolate as it is, to the eye of feeling the little fortress is not without its interest; for, as the governor told me, it was built by the heroic Saladin.

I had taken leave of my trusty Toualeb, and was again in the hands of strangers; and I do not deceive myself when I say, that on the very borders of Edom I noticed a change for the worse in the appearance of the Bedouins. According to the reports of travellers and writers, those with whom I now set out from Akaba belonged to one of the most lawless tribes of a lawless race, and they were by far the wildest and fiercest-looking of all I had yet seen; with complexions bronzed and burnt to blackness; dark eyes, glowing with a fire approaching to ferocity; figures thin and shrunken, though sinewy; chests standing out, and ribs projecting from the skin, like those of a skeleton. The sheik, like myself, was on horseback, dressed in a red silk gown like my own, and over it a large cloak of scarlet cloth, both the gifts of Messieurs Linant and Laborde; a red tarbouch with a shawl rolled round it, long red boots, and a sash; and carried pistols, a sword, and a spear about twelve feet long, pointed with steel at both ends; his brother, too, wore a silk gown, and carried pistols and sword, and the rest were armed with swords and matchlock guns, and wore the common Bedouin dress; some of them almost no dress at all. We had moved some distance from the fortress without a word being uttered, for they neither spoke to me nor with each other. I was in no humour for talking myself, but it was unpleasant to have more than a dozen men around, all bending their keen eyes upon me, and not one of them uttering a word. With a view to making some approach to acquaintance, and removing their jealousy of me as a stranger, I asked some casual question about the road; but I might better have held my peace, for it seemed that I could not well have hit upon a subject more displeasing. My amiable companions looked as black as midnight, and one of them, a particularly swarthy and truculent-looking fellow, turned short round, and told me that I had too much curiosity, and that he did not understand what right a Christian had to come there and hunt up their villages, take down their names, &c. But the sheik came in as mediator, and told them that I was a good man; that he had been to my house in Cairo, and that I was no spy; and so this cloud passed off. I did not mean to go far that afternoon, for I had left the fortress merely to get rid of the crowd, and return to fresh air and quiet; and in less than an hour I again pitched my tent in the desert. Finding plenty of brush, we kindled a large fire, and all sat down around it. It was a great object with me to establish myself on a good footing with my companions at the outset; and, more fortunate on my second attempt, before one round of coffee and pipes was over, the sheik turned to me, and with all the extravagance of Eastern hyperbole, said he thanked God for having permitted us again to see each other's face, and that I had been recovering since I saw his face; and, turning his eyes to heaven, with an expression of deep and confiding piety, he added, "God grant that you may soon become a strong man!"

and then the others all took their pipes from their mouths, and turning up their eyes to heaven, the whole band of breechless desperadoes added, "Wullah—Wullah!"—"God grant it!"

## CHAPTER XX.

Prophecy and Fulfilment.—Unpleasant Suggestions.—The Denounced Land.—Management.—A Rencontre.—An Arab's Cunning.—The Camel's Hump.—Adventure with a Lamb.—Mount Hor.—Delicate Negotiations.—Approach to Petra.

I HAD now crossed the borders of Edom. Standing near the shore of the Elanitic branch of the Red Sea, the doomed and accursed land lay stretched out before me, the theatre of awful visitations and their more awful fulfilment; given to Esau as being of the fatness of the earth, but now a barren waste, a picture of death, an eternal monument of the wrath of an offended God, and a fearful witness to the truth of the words spoken by his prophets—"For my sword shall be bathed in heaven: behold it shall come down upon Idumea, and upon the people of my curse, to judgment." "From generation to generation it shall lie waste; none shall pass through it for ever and ever. But the cormorant and the bittern shall possess it; the owl also and the raven shall dwell in it; and he shall stretch out upon it the line of confusion and the stones of emptiness. They shall call the nobles thereof to the kingdom, but none shall be there, and all her princes shall be nothing. And thorns shall come up in her palaces, nettles and brambles in the fortresses thereof: and it shall be a habitation of dragons, and a court for owls. The wild beasts of the desert shall also meet with the wild beasts of the island, and the satyr shall cry to his fellow: the screech-owl also shall rest there, and find for herself a place of rest. There shall the great owl make her nest, and lay, and hatch, and gather under her shadow: there shall the vultures also be gathered, every one with her mate. Seek ye out the book of the Lord, and read: no one of these shall fail, none shall want her mate: for my mouth it hath commanded, and his spirit it hath gathered them. And he hath cast the lot for them, and his hand hath divided it unto them by line: they shall possess it for ever; from generation to generation shall they dwell therein."—Isaiah xxxiv.

I read in the sacred book prophecy upon prophecy and curse upon curse against the very land on which I stood. I was about to journey through this land, and to see with my own eyes whether the Almighty had stayed his uplifted arm, or whether his sword had indeed come down "upon Idumea, and the people of his curse, to judgment." I have before referred to Keith on the Prophecies, where, in illustrating the fulfilment of the prophecies against Idumea, "none shall pass through it for ever and ever," after referring to the singular fact that the great caravan routes existing in the days of David and Solomon, and under the Roman empire, are now completely broken up, and that the great hadji routes to Mecca from Damascus and Cairo lie along the borders of Idumea, barely touching, and not passing through it, he proves by abundant references that to this day no traveller has ever passed through the land.

The Bedouins who roam over the land of Idumea have been described by travellers as one of their race. "The Arabs about Akaba," says Poccocke, "are a very bad people and notorious robbers, and are at war with all others." Mr Joliffe alludes to it as one of the wildest and most dangerous divisions of Arabia; and Burckhardt says, "that for the first time he had ever felt fear during his travels in the desert, and his route was the most dangerous he had ever travelled;" that he had "nothing with him that could attract the notice or excite the cupidity of the Bedouins," and was "even stripped of some rags that covered his wounded ankles." Messrs Legh and Banks, and Captains Irby and Mangles, were told that the Arabs of Wady Moussa, the tribe that formed

my escort, "were a most savage and treacherous race, and that they would use their Frank's blood for a medicine;" and they learned on the spot that "upwards of thirty pilgrims from Barbary had been murdered at Petra the preceding year by the men of Wady Moussa;" and they speak of the opposition and obstruction from the Bedouins as resembling the case of the Israelites under Moses, when Edom refused to give them passage through his country. None of these had passed through it; and unless the two Englishmen and Italian before referred to succeeded in their attempt, when I pitched my tent on the borders of Edom no traveller had ever done so. The ignorance and mystery that hung over it added to the interest with which I looked to the land of barrenness and desolation stretched out before me; and I would have regarded all the difficulties and dangers of the road merely as materials for a not unpleasant excitement, if I had only felt a confidence in my physical strength to carry me through. But some idea may be formed of my unhappy condition from the circumstance that, in the evening, my servant, an honest and faithful fellow, who I believe was sincerely attached to me, while I was lying on my mat, with many apologies, and hoping I would not think hard of him, and praying that no accident might happen to me, told me that he was a poor man, and it would be very hard for him to lose his earnings, and that an English traveller had died in Syria the year before, and his consul had taken possession of his effects, and to this day his poor servant had never received his wages. I at first thought it unkind of him to come upon me at that moment with such a suggestion; but I soon changed my mind. I had not paid him a cent since he had been with me, and his earnings were no trifle to him; and, after all, what was I to him except a debtor? In any event I should leave him in a few months, and in all probability should never see him again. I told him that he knew the circumstances under which we had left Cairo, that I had brought with me barely enough to pay my expenses on the road; nor could I give him what he wanted, an order upon my consul at Beyroot; but after he had gone out, with somewhat the same feelings that may be supposed to possess a man in extremis writing his own will, I wrote an order, including a gratuity which he richly deserved, upon a merchant in Beyroot, upon whom I had a letter of credit; but the cheerlessness and helplessness of my situation never struck me so forcibly as when I reflected that, in the uncertain position in which I was placed, it was not prudent to give it into his hands. At that moment I mistrusted every body; and though I had not then, nor at any subsequent time, the slightest reason to doubt his faith, I did not dare to let him know that he could in any event be a gainer by my death. I considered it necessary to make him suppose that his interest was identified with my safety, and therefore folded up the paper, enclosed it in the letter of credit directed to the merchant, and put it back in my trunk; and I need not say that it was a great satisfaction to me that the validity of the draft was never tested.

When I awoke in the morning, the first thing I thought of was my horse. It almost made me well to think of him, and it was not long before I was on his back.

Standing near the shore of this northern extremity of the Red Sea, I saw before me an immense sandy valley, which, without the aid of geological science, to the eye of common observation and reason had once been the bottom of a sea or the bed of a river. This dreary valley, extending far beyond the reach of the eye, had been partly explored by Burckhardt; sufficiently to ascertain and mention it in the latest geography of the country as the great valley of El Ghor, extending from the shores of the Elanitic Gulf to the southern extremity of the Lake Asphaltites or the Dead Sea; and it was manifest, by landmarks of Nature's own providing, that over that sandy plain those seas had once mingled their waters, or, perhaps, more probably, that before the cities of the plain had been consumed by brimstone and fire, and Sodom and Gomorrah covered by a pestilential lake, the Jordan had here rolled its waters. The valley

varied from four to eight miles in breadth, and on each side were high, dark, and barren mountains, bounding it like a wall. On the left were the mountains of Judea, and on the right those of Seir, the portion given to Esau as an inheritance; and among them, buried from the eyes of strangers, the approach to it known only to the wandering Bedouins, was the ancient capital of his kingdom, the excavated city of Petra, the cursed and blighted Edom of the Edomites. The land of Idumea lay before me, in barrenness and desolation; no trees grew in the valley, and no verdure on the mountain tops. All was bare, dreary, and desolate.

But the beauty of the weather atoned for this barrenness of scene; and, mounted on the back of my Arabian, I felt a lightness of frame and an elasticity of spirits that I could not have believed possible in my actual state of health. Patting the neck of the noble animal, I talked with the sheik about his horse, and, by warm and honest praises, was rapidly gaining upon the affections of my wild companions. The sheik told me that the race of these horses had been in his family more than 400 years, though I am inclined to think, from his not being able to tell his own age, that he did not precisely know the pedigree of his beasts. If any thing connected with my journey in the East could throw me into ecstasies, it would be the recollection of that horse. I felt lifted up when on his back, and snuffed the pure air of the desert with a zest not unworthy of a Bedouin. Like all the Arabian horses, he was broken only to the walk and gallop, the unnatural and ungraceful movement of a trot being deemed unworthy the free limbs of an Arab courser.

The sheik to-day was more communicative. Indeed, he became very fond of talking; suspicious as I was, and on the watch for any thing that might rouse my apprehensions, I observed that he regularly settled down upon the same topics, namely, the dangers of the road, the bad character of the Arabs, his great friendship for me the first moment he saw me, and his determination to protect me with his life against all dangers. This was well enough for once or twice, but he repeated it too often, and overshot the mark, as I did when I first began to recommend myself to them. I suspected him of exaggerating the dangers of the road to enhance the value of his services; and lest I should entertain any doubt upon the subject, he betrayed himself by always winding up with a reference to the generosity of Monsieur Linant. The consequence was, that instead of inspiring me with fear, he gave me confidence; and by the end of my first day's journey, I had lost nearly all apprehensions of the dangers of the road, and acquired some distrust and contempt for my protector. We were all getting along very well, however. Paul had been playing a great game among the men, and, by his superior knowledge of mankind, easily circumvented these ignorant Bedouins; and his Arabic name of "Osman" was constantly in some one's mouth. I forgot to mention that, very early in my journey in the desert, my companions, unable to twist my name to suit their Arabic intonations, had called me *Abdel Hasin* (literally, the slave of the good God), and Paul, Osman.

In the evening, while making a note in a little memorandum-book, and on the point of lying down to sleep, I heard a deep guttural voice at some distance outside, and approaching nearer, till the harsh sounds grated as if spoken in my very ears. My Bedouins were sitting around a large fire at the door of the tent, and through the flames I saw coming up two wild and ferocious-looking Arabs, their dark visages reddened by the blaze, and their keen eyes flashing; and hardly had they reached my men, before all drew their swords, and began cutting away at each other with all their might. I did not feel much apprehension, and could not but admire the boldness of the fellows, two men walking up deliberately and drawing upon ten. One of the first charges Toualeb gave me on my entrance into the desert was, if the Arabs composing my escort got into any quarrel, to keep out of the way and let them fight it out by themselves; and in pursuance of this advice, without making any attempt to interfere, I stood in the door

watching the progress of the fray. The larger of the two was engaged with the sheik's brother, and their swords were clashing in a way that would soon have put an end to one of them, when the sheik, who had been absent at the moment, sprang in among them, and knocking up their swords with his long spear, while his scarlet cloak fell from his shoulders, his dark face reddened, and his black eyes glowed in the firelight, with a voice that drowned the clatter of the weapons, roared out a volley of Arabic gutturals which made them drop their points, and apparently silenced them with shame. What he said we did not know, but the result was a general cessation of hostilities. The sheik's brother had received a cut in the arm, and his adversary helped to bind up the wound, and they all sat down together round the fire to pipes and coffee, as good friends as a party of Irishmen with their heads broken after a Donnybrook fairing. I had noticed, in this flurry, the exceeding awkwardness with which they used their swords, by their overhand blows constantly laying themselves open, so that any little Frenchman with his toothpick of a rapier would have run them through before they could have cried quarter. After the thing was all over, Paul went out and asked the cause; but the sheik told him that it was an affair of their own, and with this satisfactory answer we were obliged to rest content.

Though all was now quiet, the elements of discord were still existing. The new-comer was a ferocious fellow; his voice was constantly heard, like the hoarse croaking of some bird of evil omen, and sometimes it was raised to the pitch of high and deadly passion. Paul heard him ask if I was a European, to which the sheik answered No; I was a Turk. He then got upon the railroad to Suez, and the poor benighted Bedouin, completely behind the age in the march of improvement, having never read Say's Political Economy or Smith's Wealth of Nations, denounced it as an invasion of the natural rights of the people, and a wicked breaking up of the business of the camel-drivers. He cursed every European that ever set foot in their country; and, speaking of Mr Galloway, the engineer of the proposed railroad, hoped that he might some day meet him, and swore he would strangle him with his own hands.

In the morning we were again under way. Our quarrelsome friend of the night before was by our side, perched on the bare back of a dromedary, and, if possible, looking more grim and savage by daylight. His companion was mounted behind him, and he kept near the sheik, occasionally crossing my path, looking back at me, and croaking in the sheik's ears as he had done the night before. Two or three times he crossed my path, as if with the intention of going into the mountains; and then, as if he found it impossible to tear himself away, returned to the sheik. At length he did go, and with a most discontented and disconsolate air; and after he had gone, the sheik told us, that when they came up to the fire, they demanded tribute or bucksheesh from the stranger passing over the Bedouins' highway; that his brother had refused to pay it, which had been the cause of the quarrel; and that, when he himself came up, he had told the demanders of tribute that he had undertaken to protect me from injury through the desert; that he had given his head to Mahommed Ali for my safety, and would defend me with his life against every danger; but that, finally, he had pacified them by giving them a couple of dollars apiece. I did not believe this. They looked too disconsolate when they went away; for the four dollars would have made the hearts of two beggarly Bedouins leap for joy; and I could not help asking him if we were obliged to buy our peace when only two came upon us, what we should do when 100 should come; to which he answered that they must all be paid, and that it was impossible to pass through the desert without it.

We got through the day remarkably well, the scene being always precisely the same; before us, the long, desolate, sandy valley, and on each side the still more desolate and dreary mountains. Towards evening we encamped; and after sitting some time around a fire

with my companions, I entered my tent. Soon after, the sheik, in pursuance of his pitiful plan of exciting my fears and raising his own value, sent in for my gun and pistols, telling me that there were Arabs near; that he heard the barking of a dog, and intended to keep watch all night. I had already seen so much of him, that I knew this was a mere piece of braggadocio; and I met it with another, by telling him that no man could use my pistols better than myself, and that all he had to do was, upon the first alarm, to give me notice, and I would be among them. About an hour afterwards I went out and found them all asleep; and I could not help making Paul rouse the sheik, and ask him if he did not want the pistols for his vigilant watch.

In the morning we started at half-past six. The day was again beautiful and inspiring; my horse and myself had become the best friends in the world; and though I was disgusted with the sheik's general conduct, I moved quietly along the valley, conversing with him or Paul, or with any of the men, about any thing that happened to suggest itself. I remember I had a long discourse about the difference between the camel and the dromedary. Buffon gives the camel two humps, and the dromedary one; and this I believe is the received opinion, as it had always been mine; but since I had been in the East, I had remarked that it was exceedingly rare to meet a camel with two humps. I had seen together at one time, on the starting of the caravan of pilgrims to Mecca, perhaps 20,000 camels and dromedaries, and had not seen among them more than half a dozen with two humps. Not satisfied with any explanation from European residents or travellers, I had inquired among the Bedouins; and Toualeb, my old guide, brought up among camels, had given such a strange account that I never paid any regard to it. Now, however, the sheik told me the same thing, namely, that they were of different races, the dromedary being to the camel as the blood-horse is to the cart-horse; and that the two humps were peculiar neither to the dromedary nor the camel, or natural to either; but that both are always born with only one hump, which being a mere mass of flesh, and very tender, almost as soon as the young camel is born a piece is sometimes cut out of the middle for the convenience of better arranging the saddle; and, being cut out of the centre, a hump is left on either side of the cavity; and this, according to the account given by Toualeb, is the only way in which two humps ever appear on the back of a camel or dromedary. I should not mention this story if I had heard it only once; but, precisely as I had it from Toualeb, it was confirmed with a great deal of circumstantial detail by another Bedouin, who like himself had lived among camels and dromedaries all his life; and his statement was assented to by all his companions. I do not give this out as a discovery made at this late day in regard to an animal so well known as the camel—indeed, I am told that the Arabs are not ignorant of that elegance of civilised life called “quizzing;” I give it merely to show how I whiled away my time in the desert, and for what it is worth.

Towards mid-day the sheik dashed across the plain, with his long lance poised in his hand, and his scarlet dress streaming in the wind; and about an hour afterwards we came to his spear stuck in the sand, and a little Bedouin boy sitting by it to invite us to his father's tent. We turned aside, and, coming to the tent, found the sheik sitting on the ground refreshing himself with long draughts of goat's milk. He passed the skin to us; but, as master of the ceremonies, he declined the regular Arab invitation to stay and eat a lamb. He could not, however, neglect the gods the gods provided, and told our host that we would take a lamb with us for our evening meal. The lamb was caught, and, with his legs tied, was thrown into a sack, where he made music for us for the rest of the day. To the Bedouin, next to the pleasure of eating a lamb is that of knowing he has one to eat; and so the bleating of the doomed innocent was merely a whetter of appetite. After we had gone some distance from the tent, we set down the lamb on the

ground, and I never saw a creature so perfectly the emblem of helplessness. At first he ran back a little way from us; then stopped; and apparently feeling the loneliness of his condition, returned and followed us, and in a few moments was under the feet of the camels, a part of our caravan unwittingly moving to the slaughter. The tent was hardly pitched before he lay bleeding on the ground; and the fire was no sooner kindled than his entrails, liver, &c., were in the burning brush; and in a few moments the Arabs were greedily devouring the meal into which he had been so speedily converted. The whole scene which I have before described was repeated; and, as before, in the morning the skin was the only part of the lamb to be seen.

One thing in the sheik was particularly disagreeable. He was constantly talking with Paul about the sacrifice he made in accompanying me; his confident expectation that I would pay him well for it, and the generosity of M. Linant; always winding up with asking what bucksheesh I intended to give him. Paul told me all that passed, and it was evident that the sheik and his men were making extravagant calculations. I had estimated with Mr Gliddon the probable expenses to Jerusalem, founded on the rate of hire for camels which the sheik had named at Cairo; and as it was not beyond the range of possibilities that I should be stripped on the way, I had brought with me barely enough to cover my probable expenses; and, consequently, I saw that my means were very likely to fall short of the sheik's expectations. I did not want any disappointment at the last, and that night I called him to my tent, resolved upon coming to an understanding. I told him that, knowing it was a dangerous road, and that I was subject to the risk of being robbed, I had brought with me a specific sum of money, all of which I intended for him, and that all he scattered along the road would be so much taken from his own pocket in the end. He was evidently startled, and expressed his surprise that a howaga, or gentleman, should have any bottom to his pocket, but promised to economise in future.

The next day the general features of the scene were the same, eternal barrenness and desolation; and moving to the right, at one o'clock we were at the foot of the mountains of Seir; and towering above all the rest, surmounted by a circular dome, like the tombs of the sheiks in Egypt, was the bare and rugged summit of Mount Hor, the burial-place of Aaron, visible in every direction at a great distance from below, and on both sides the great range of mountains, and forming one of the marks by which the Bedouin regulates his wanderings in the desert. Soon after, we turned in among the mountains, occasionally passing small spots of verdure, strangely contrasting with the surrounding and general desolation. Towards evening, in a small mountain on our left, we saw an excavation in the rock, which the sheik said had been a fortress; and, as of every other work of which the history is unknown, its construction was ascribed to the early Christians. It was a beautiful afternoon; gazelles were playing in the valleys, and partridges running wild up the sides of the mountains, and we pitched our tent partly over a carpet of grass, with the door open to the lofty tomb of the great high priest of Israel.

In the evening the sheik came to my tent for money, having been very pertinacious on that tender subject all day with Paul, asking him how much he thought I had with me, and how much I intended to give him. He began by asking me for pay for the camels, at the price agreed upon at Cairo. If he had asked me before starting from Akaba, I should probably have paid him; but after what I had seen, and what had passed between him and Paul, I did not like his asking for it now. He told me, too, that we were now at the door of Petra, and that it would be necessary to pay a bucksheesh or tribute on entering, but he could not tell how much would be required, as that would depend altogether on circumstances. There was always a guard stationed at the entrance of the defile leading to Petra, and the amount to be paid would depend upon the number

we might happen to find when we entered. These were never less than thirty or forty; and if there should not be more, the tribute exacted would not be more than thirty or forty dollars, but there might be two or three hundred; and, at all events, I had better give him my purse, and he would return me what was left. I suspected that, as he could not find out from Paul either how much I had with me or what I intended to give him, this story of the tribute was merely a pretext to levy an immediate contribution. The precise danger I had to fear was, that he would get my money from me piecemeal, and, when we came among Bedouins where it would be necessary to buy my peace, go off and leave me to their mercy. I did not want to have any rupture with him, particularly at that moment when I was at the very door of Petra, and might lose all that I had been endeavouring with so much personal difficulty to accomplish; and therefore told him, as to the bucksheesh for entering Petra, that I expected; and, when we should arrive there and learn how much it was, would be ready to pay it; but, in the meantime, for any little casual expense that might be incurred, I would give him a purse of 500 piastres, or 25 dollars. Touching the hire of camels, I said that I did not expect to pay it until we should arrive at Hebron; and, hurling back upon him one of his own flourishes, told him that it was distrustful my honour to ask it now. I reminded him of our conversation at Cairo, remarking that I had come into the desert upon the faith of his promise; and he replied very impertinently, if not menacingly, that one word here was worth a hundred at Cairo. I was somewhat roused at this, and, determined not to be dragged into compliance, forgot for a moment my prudential plan, and told him that I would not be driven into that or any thing else; and that sooner than submit to his demand, I would turn back here, at the very door of Petra, and return to Cairo. This had its effect, for he was no more disposed to proceed to extremities than myself; and when I found him giving way a little, I threw in a powerful argument, which I had several times before hinted at, namely, that there were two parties on the Nile, who were exceedingly anxious to make the same journey, and who would be governed altogether by the report I should make. I saw that his avarice and hope of future gain were rapidly getting the better of his eagerness to touch his money before it was earned; and without inflicting upon the reader a full account of our long negotiation, made up principally of blustering and exaggeration, with some diplomatic concessions on both sides, it is enough to say that at last, to my great relief, he withdrew his demand, and took what I offered.

Before daybreak the next morning we had struck our tent, and sending it and the other baggage by another route, the sheik being afraid to take with us any thing that might tempt the Bedouins, and leaving behind us several of our men, the sheik, his brother, three Arabs, Paul, and myself, with nothing but what we had on, and provisions for one day, started for Wady Moussa and the city of Petra. Our course was a continued ascent. I have found it throughout difficult to give any description which can impart to the reader a distinct idea of the wild and desolate scenes presented among these mountainous deserts. I have been, too, in so many of the same general nature, that particular ones do not present themselves to my mind now with the force and distinctness of perfect recollection; and in the few rough and hurried notes which I made on the spot, I marked rather the effect than the causes which produced it. I remember, however, that the mountains were barren, solitary, and desolate, and that as we ascended, their aspect became more and more wild and rugged, and rose to grandeur and sublimity. I remember, too, that among these arid wastes of crumbling rock there were beautiful streams gushing out from the sides of the mountains; and sometimes small valleys, where the green grass, and shrubs, and bushes, were putting forth an early spring; and that, altogether, I saw among the stony mountains of Arabia Petræa more verdure than

I had observed since I left the banks of the Nile. I remember, moreover, that the ascent was difficult; that our camels toiled laboriously; and that even our sure-footed Arabian horses often slipped upon the steep and rugged path. Once the sheik and myself, being in advance of the rest, sat down upon an eminence which overlooked, on one side, a range of wild and barren mountains, and on the other, the dreary valley of El Ghor; above us was the venerable summit of Mount Hor; and near us a stone blackened with smoke, and surrounded by fragments of bones, showing the place where the Arabs had sacrificed sheep to the Prophet Aaron. From this point we wound along the base of Mount Hor, which, from this great height, seemed just beginning to rise into a mountain; and I remember, that, in winding slowly along its base, as our companions had objected to our mounting to the tomb of Aaron, Paul and I were narrowly examining its sides for a path, and making arrangements to slip out as soon as they should all be asleep, and ascend by moonlight. Not far from the base of Mount Hor we came to some tombs cut in the sides of the rocks, and standing at the threshold of the entrance to the excavated city. Before entering this extraordinary place, it would not be amiss, in a few words, to give its history.

## CHAPTER XXI.

Petra.—Arrival.—Entrance to the City.—The Temple of Petra.—A Record.—The Theatre.—Tombs of Petra.—Arab Simplicity.—Departure from Petra.—A Night in a Tomb.—Dangers of the Route.

PETRA, the excavated city, the long lost capital of Edom, in the Scriptures and profane writings, in every language in which its name occurs, signifies a rock; and through the shadows of its early history, we learn that its inhabitants lived in natural clefts or excavations made in the solid rock. Desolate as it now is, we have reason to believe that it goes back to the time of Esau, "the father of Edom;" that princes and dukes, eight successive kings, and again a long line of dukes, dwelt there before any king "reigned over Israel;" and we recognise it from the earliest ages as the central point to which came the caravans from the interior of Arabia, Persia, and India, laden with all the precious commodities of the East, and through which these commodities were distributed through Egypt, Palestine, and Syria, and all the countries bordering on the Mediterranean, even Tyre and Sidon deriving their purple and dyes from Petra. Eight hundred years before Christ, Amaziah, the King of Judea, "slew of Edom in the Valley of Salt 10,000, and took Selah (the Hebrew name of Petra) by war." Three hundred years after the last of the prophets, and nearly a century before the Christian era, the "King of Arabia" issued from his palace at Petra, at the head of 50,000 men, horse and foot, entered Jerusalem, and, uniting with the Jews, pressed the siege of the temple, which was only raised by the advance of the Romans; and in the beginning of the second century, though its independence was lost, Petra was still the capital of a Roman province. After that time it rapidly declined; its history became more and more obscure; for more than a thousand years it was completely lost to the civilised world; and until its discovery by Burckhardt in 1812, except to the wandering Bedouins, its very site was unknown.

And this was the city at whose door I now stood. In a few words, this ancient and extraordinary city is situated within a natural amphitheatre of two or three miles in circumference, encompassed on all sides by rugged mountains 500 or 600 feet in height. The whole of this area is now a waste of ruins; dwelling-houses, palaces, temples, and triumphal arches, all prostrate together in undistinguishable confusion. The sides of the mountains are cut smooth, in a perpendicular direction, and filled with long and continued ranges of dwelling-houses, temples, and tombs, excavated with vast

labour out of the solid rock; and while their summits present Nature in her wildest and most savage form, their bases are adorned with all the beauty of architecture and art, with columns, and porticoes, and pediments, and ranges of corridors, enduring as the mountains out of which they are hewn, and fresh as if the work of a generation scarcely yet gone by.

Nothing can be finer than the immense rocky rampart which encloses the city. Strong, firm, and immovable as Nature itself, it seems to deride the walls of cities, and the puny fortifications of skilful engineers. The only access is by clambering over this wall of stone, practicable only in one place, or by an entrance the most extraordinary that Nature, in her wildest freaks, has ever framed. The loftiest portals ever raised by the hands of man, the proudest monuments of architectural skill and daring, sink into insignificance by the comparison. It is, perhaps, the most wonderful object in the world, except the ruins of the city to which it forms the entrance. Unfortunately, I did not enter by this door, but by clambering over the mountains at the other end; and when I stood upon the summit of the mountain, though I looked down upon the vast area filled with ruined buildings and heaps of rubbish, and saw the mountain sides cut away so as to form a level surface, and presenting long ranges of doors in successive tiers or stories, the dwelling and burial-places of a people long since passed away; and though immediately before me was the excavated front of a large and beautiful temple, I was disappointed. I had read the unpublished description of Captains Irby and Mangles. Several times the sheik had told me, in the most positive manner, that there was no other entrance; and I was moved to indignation at the marvellous and exaggerated, not to say false representations, as I thought, of the only persons who had given any account of this wonderful entrance. I was disappointed, too, in another matter. Burckhardt had been accosted, immediately upon his entry, by a large party of Bedouins, and been suffered to remain but a very short time. Messrs Legh, Banks, Irby, and Mangles, had been opposed by hundreds of Bedouins, who swore "that they should never enter their territory nor drink of their waters," and "that they would shoot them like dogs if they attempted it." And I expected some immediate opposition from at least the thirty or forty, fewer than whom, the sheik had told me, were never to be found in Wady Moussa. I expected a scene of some kind; but at the entrance of the city there was not a creature to dispute our passage; its portals were wide open, and we passed along the stream down into the area, and still no man came to oppose us. We moved to the extreme end of the area; and when in the act of dismounting at the foot of the rock on which stood the temple that had constantly faced us, we saw one solitary Arab, straggling along without any apparent object, a mere wanderer among the ruins; and it is a not uninteresting fact, that this poor Bedouin was the only living being we saw in the desolate city of Petra. After gazing at us for a few moments from a distance, he came towards us, and in a few moments was sitting down to pipes and coffee with my companions. I again asked the sheik for the other entrance, and he again told me there was none; but I could not believe him, and set out to look for it myself; and although in my search I had already seen enough abundantly to repay me for all my difficulties in getting there, I could not be content without finding this desired avenue.

In front of the great temple, the pride and beauty of Petra, of which more hereafter, I saw a narrow opening in the rocks, exactly corresponding with my conception of the object for which I was seeking. A full stream of water was gushing through it, and filling up the whole mouth of the passage. Mounted on the shoulders of one of my Bedouins, I got him to carry me through the swollen stream at the mouth of the opening, and set me down on a dry place a little above, whence I began to pick my way, occasionally taking to the shoulders of my follower, and continued to advance more than a mile. I was beyond all peradventure in the great entrance I

was seeking. There could not be two such, and I should have gone on to the extreme end of the ravine, but my Bedouin suddenly refused me the further use of his shoulders. He had been some time objecting and begging me to return, and now positively refused to go any farther; and, in fact, turned about himself. I was anxious to proceed, but I did not like wading up to my knees in the water, nor did I feel very resolute to go where I might expose myself to danger, as he seemed to intimate. While I was hesitating, another of my men came running up the ravine, and shortly after him Paul and the sheik, breathless with haste, and crying in low gutturals, "El Arab! el Arab!"—"The Arabs! the Arabs!" This was enough for me. I had heard so much of El Arab that I had become nervous. It was like the cry of Delilah in the ears of the sleeping Samson, "The Philistines be upon thee." At the other end of the ravine was an encampment of the El Alouins; and the sheik, having due regard to my communication about money matters, had shunned this entrance to avoid bringing upon me this horde of tribute-gatherers for a participation in the spoils. Without any disposition to explore farther, I turned towards the city; and it was now that I began to feel the powerful and indelible impression that must be produced on entering, through this mountainous passage, the excavated city of Petra.

For about two miles it lies between high and precipitous ranges of rocks, from 500 to 1000 feet in height, standing as if torn asunder by some great convulsion, and barely wide enough for two horsemen to pass abreast. A swelling stream rushes between them; the summits are wild and broken; in some places overhanging the opposite sides, casting the darkness of night upon the narrow defile; then receding and forming an opening above, through which a strong ray of light is thrown down, and illuminates with the blaze of day the frightful chasm below. Wild fig-trees, oleanders, and ivy, were growing out of the rocky sides of the cliffs hundreds of feet above our heads; the eagle was screaming above us; all along were the open doors of tombs, forming the great necropolis of the city; and at the extreme end was a large open space, with a powerful body of light thrown down upon it, and exhibiting in one full view the façade of a beautiful temple, hewn out of the rock, with rows of Corinthian columns and ornaments, standing out fresh and clear, as if by yesterday from the hands of the sculptor. Though coming directly from the banks of the Nile, where the preservation of the temples excites the admiration and astonishment of every traveller, we were roused and excited by the extraordinary beauty and excellent condition of the great temple at Petra. Even in coming upon it, as we did, at disadvantage, I remember that Paul, who was a passionate admirer of the arts, when he first obtained a glimpse of it, involuntarily cried out, and moving on to the front with a vivacity I never saw him exhibit before or afterwards, clapped his hands, and shouted in ecstacy. To the last day of our being together he was in the habit of referring to his extraordinary fit of enthusiasm when he first came upon that temple; and I can well imagine that, entering by this narrow defile, with the feelings roused by its extraordinary and romantic wildness and beauty, the first view of that superb façade must produce an effect which could never pass away. Even now, that I have returned to the pursuits and thought-engrossing incidents of a life in the busiest city in the world, often in situations as widely different as light from darkness, I see before me the façade of that temple; neither the Coliseum at Rome, grand and interesting as it is, nor the ruins of the Acropolis at Athens, nor the Pyramids, nor the mighty temples of the Nile, are so often present to my memory.

The whole temple, its columns, ornaments, porticoes, and porches, are cut out from and form part of the solid rock; and this rock, at the foot of which the temple stands like a mere print, towers several hundred feet above, its face cut smooth to the very summit, and

the top remaining wild and misshapen as Nature made it. The whole area before the temple is perhaps an acre in extent, enclosed on all sides except at the narrow entrance, and an opening to the left of the temple, which leads into the area of the city by a pass through perpendicular rocks 500 or 600 feet in height.

It is not my design to enter into the details of the many monuments in this extraordinary city; but to give a general idea of the character of all the excavations, I cannot do better than go within the temple. Ascending several broad steps, we entered under a colonnade of four Corinthian columns, about thirty-five feet high, into a large chamber of some fifty feet square and twenty-five feet high. The outside of the temple is richly ornamented, but the interior is perfectly plain, there being no ornament of any kind upon the walls or ceiling; on each of the three sides is a small chamber for the reception of the dead; and on the back wall of the innermost chamber I saw the names of Messrs Legh, Banks, Irby, and Mangles, the four English travellers who with so much difficulty had effected their entrance to the city; of Messieurs Laborde and Linant, and the two Englishmen and Italian of whom I have before spoken; and two or three others, which, from the character of the writing, I supposed to be the names of attendants upon some of these gentlemen. These were the only names recorded in the temple; and, besides Burckhardt, no other traveller had ever reached it. I was the first American who had ever been there. Many of my countrymen, probably, as was the case with me, have never known the existence of such a city; and, independently of all personal considerations, I confess that I felt what I trust was not an inexcusable pride, in writing upon the innermost wall of that temple the name of an American citizen; and under it, and flourishing on its own account in temples, and tombs, and all the most conspicuous places in Petra, is the illustrious name of "Paulo Nozzo, dragomano."

Leaving the temple and the open area on which it fronts, and following the stream, we entered another defile much broader than the first, on each side of which were ranges of tombs, with sculptured doors and columns; and on the left, in the bosom of the mountain, hewn out of the solid rock, is a large theatre, circular in form, the pillars in front fallen, and containing thirty-three rows of seats, capable of containing more than 3000 persons. Above the corridor was a range of doors opening to chambers in the rocks, the seats of the princes and wealthiest inhabitants of Petra, and not unlike a row of private boxes in a modern theatre.

The whole theatre is at this day in such a state of preservation, that if the tenants of the tombs around could once more rise into life, they might take their old places on its seats, and listen to the declamation of their favourite player. To me the stillness of a ruined city is nowhere so impressive as when sitting on the steps of its theatre; once thronged with the gay and pleasure-seeking, but now given up to solitude and desolation. Day after day these seats had been filled, and the now silent rocks had echoed to the applauding shout of thousands; and little could an ancient Edomite imagine that a solitary stranger, from a then unknown world, would one day be wandering among the ruins of his proud and wonderful city, meditating upon the fate of a race that has for ages passed away. Where are ye, inhabitants of this desolate city!—ye who once sat on the seats of this theatre, the young, the high-born, the beautiful, and brave, who once rejoiced in your riches and power, and lived as if there were no grave? Where are ye now? Even the very tombs, whose open doors are stretching away in long ranges before the eyes of the wondering traveller, cannot reveal the mystery of your doom: your dry bones are gone; the robber has invaded your graves, and your very ashes have been swept away to make room for the wandering Arab of the desert.

But we need not stop at the days when a gay population were crowding to this theatre. In the earliest periods of recorded time, long before this theatre was

built, and long before the tragic muse was known, a great city stood here. When Esau, having sold his birthright for a mess of pottage, came to his portion among the mountains of Seir; and Edom, growing in power and strength, became presumptuous and haughty, until, in her pride, when Israel prayed a passage through her country, Edom said unto Israel, "Thou shalt not pass by me, lest I come out against thee with the sword."

Amid all the terrible denunciations against the land of Idumea, "her cities and the inhabitants thereof," this proud city among the rocks, doubtless for its extraordinary sins, was always marked as a subject of extraordinary vengeance. "I have sworn by myself, saith the Lord, that Bozrah (the strong or fortified city) shall become a desolation, a reproach, and a waste, and a curse, and all the cities thereof shall be perpetual waste. Lo, I will make thee small among the heathen, and despised among men. Thy terriblest hath deceived thee, and the pride of thy heart, oh thou that dwellest in the clefts of the rocks, that holdest the height of the hill; though thou shouldst make thy nest as high as the eagle, I will bring thee down from thence, saith the Lord."—Jeremiah xlix., 13, 16. "They shall call the nobles thereof to the kingdom, but none shall be there, and all her princes shall be nothing; and thorns shall come up in her palaces, nettles and brambles in the fortresses thereof, and it shall be a habitation for dragons and a court for owls."—Isaiah xxxiv., 14, 15.

I would that the sceptic could stand as I did among the ruins of this city among the rocks, and there open the sacred book and read the words of the inspired penman, written when this desolate place was one of the greatest cities in the world. I see the scoff arrested, his cheek pale, his lip quivering, and his heart quaking with fear, as the ruined city cries out to him in a voice loud and powerful as that of one risen from the dead; though he would not believe Moses and the prophets, he believes the handwriting of God himself in the desolation and eternal ruin around him. We sat on the steps of the theatre, and made our noonday meal; our drink was from the pure stream that rolled down at our feet. Paul and myself were alone. We scared the partridge before us as we ascended, and I broke for a moment the stillness of the desolate city by the report of my gun.

All around the theatre, in the sides of the mountains, were ranges of tombs; and directly opposite they rose in long tiers one above another. Having looked into those around the theatre, I crossed to those opposite; and, carefully as the brief time I had would allow, examined the whole range. Though I had no small experience in exploring catacombs and tombs, these were so different from any I had seen, that I found it difficult to distinguish the habitations of the living from the chambers of the dead. The façades or architectural decorations of the front were everywhere handsome; and in this they differed materially from the tombs in Egypt. In the latter the doors were simply an opening in the rock, and all the grandeur and beauty of the work within; while here the door was always imposing in its appearance, and the interior was generally a simple chamber, unpainted and unsculptured.

I say that I could not distinguish the dwellings from the tombs, but this was not invariably the case; some were clearly tombs, for there were pits in which the dead had been laid, and others were as clearly dwellings, being without a place for the deposit of the dead. One of these last particularly attracted my attention. It consisted of one large chamber, having on one side, at the foot of the wall, a stone bench about a foot high, and two or three broad, in form like the divans in the East at the present day; at the other end were several small apartments, hewn out of the rock, with partition walls left between them, like stalls in a stable, and these had probably been the sleeping apartments of the different members of the family, the mysteries of bars and bolts, of folding-doors and third stories, being unknown in the days of the ancient Edomites. There were no paintings or decorations of any kind within the chamber; but this

rock out of which it was hewn, like the whole stony rampart that encircled the city, was of a peculiarity and beauty that I never saw elsewhere, being a dark ground, with veins of white, blue, red, purple, and sometimes scarlet and light orange, running through it in rainbow streaks; and within the chambers, where there had been no exposure to the action of the elements, the freshness and beauty of the colours in which these waving lines were drawn, gave an effect hardly inferior to that of the paintings in the tombs of the kings at Thebes. From its high and commanding position, and the unusual finish of the work, this house, if so it may be called, had no doubt been the residence of one who had strutted his hour of brief existence among the wealthy citizens of Petra. In front was a large table of rock, forming a sort of court for the excavated dwelling, where probably, year after year, in this beautiful climate, the Edomite of old sat under the gathering shades of evening, sometimes looking down upon the congregated thousands and the stirring scenes in the theatre beneath, or beyond upon the palaces and dwellings in the area of the then populous city.

Farther on in the same range, though, in consequence of the steps of the streets being broken, we were obliged to go down and ascend again before we could reach it, was another temple, like the first, cut out of the solid rock, and, like the first, too, having for its principal ornament a large urn, shattered and bruised by musket balls; for the ignorant Arab, believing that gold is concealed in it, day after day, as he passes, levels at it his murderous gun, in the vain hope to break the vessel and scatter a golden shower on the ground.

But it would be unprofitable to dwell upon details. In the exceeding interest of the scene around me, I hurried from place to place, utterly insensible to physical fatigue; and being entirely alone, and having a full and undisturbed range of the ruins, I clambered up broken staircases and among the ruins of streets; and, looking into one excavation, passed on to another and another, and made the whole circuit of the desolate city. There, on the spot, every thing had an interest which I cannot give in description; and if the reader has followed me so far, I have too much regard for him to drag him about after me as I did Paul. I am warned of the consequences by what occurred with that excellent and patient follower; for before the day was over, he was completely worn out with fatigue.

The shades of evening were gathering around us as we stood for the last time on the steps of the theatre. Perfect as has been the fulfilment of the prophecy in regard to this desolate city, in no one particular has its truth been more awfully verified than in the complete destruction of its inhabitants; in the extermination of the race of the Edomites. In the same day, and by the voice of the same prophets, came the separate denunciations against the descendants of Israel and Edom, declaring against both a complete change in their temporal condition; and while the Jews have been dispersed in every country under heaven, and are still, in every land, a separate and unmixed people, "the Edomites have been cut off for ever, and there is not any remaining of the house of Esau."

"Wisdom has departed from Teman, and understanding out of the mount of Esau;" and the miserable Arab who now roams over the land cannot appreciate or understand the works of its ancient inhabitants. In the summer he cultivates the few valleys in which seed will grow, and in the winter makes his habitation in the tombs; and, stimulated by vague and exaggerated traditional notions of the greatness and wealth of the people who have gone before him, his barbarous hand is raised against the remaining monuments of their arts; and as he breaks to atoms the sculptured stone, he expects to gather up their long-hidden treasures. I could have lingered for days on the steps of that theatre, for I never was at a place where such a crowd of associations pressed upon the mind. But the sheik was hurrying me away. From the first he had told me that I must not pass a night within the city; and begging me not to

tempt my fortune too rashly, he was perpetually urging me to make my retreat while there was yet time. He said that, if the Arabs at the other end of the great entrance heard of a stranger being there, they would be down upon me to a man, and, not content with extorting money, would certainly prevent my visiting the tomb of Aaron. He had touched the right chord; and considering that weeks or months could not impress the scene more strongly on my mind, and that I was no artist, and could not carry away on paper the plans and models of ancient art, I mounted my horse from the very steps of the theatre, and followed the sheik in his progress up the valley. Turning back from the theatre, the whole area of the city burst upon the sight at once, filled with crumbling masses of rock and stone, the ruined habitations of a people long since perished from the face of the earth, and encompassed on every side by high ranges of mountains; and the sides of these were cut smooth, even to the summit, hundreds of feet above my head as I rode past, and filled with long-continued ranges of open doors, the entrances to dwellings and tombs, of which the small connecting staircases were not visible at a distance, and many of the tenements seemed utterly inaccessible.

Every moment the sheik was becoming more and more impatient; and, spurring my horse, I followed him on a gallop among the ruins. We ascended the valley, and rising to the summit of the rocky rampart, it was almost dark when we found ourselves opposite a range of tombs in the suburbs of the city. Here we dismounted; and selecting from among them one which, from its finish and dimensions, must have been the last abode of some wealthy Edomite, we prepared to pass the night within its walls. I was completely worn out, when I threw myself on the rocky floor of the tomb. I had just completed one of the most interesting days in my life; for the singular character of the city, and the uncommon beauty of its ruins, its great antiquity, the prophetic denunciations of whose truth it was the witness, its loss for more than a thousand years to the civilised world, its very existence being known only to the wandering Arab, the difficulty of reaching it, and the hurried and dangerous manner in which I had reached it, gave a thrilling and almost fearful interest to the time and place, of which I feel it utterly impossible to convey any idea.

In the morning Paul and I had determined, when our companions should be asleep, to ascend Mount Hor by moonlight; but now we thought only of rest; and seldom has the pampered tenant of a palace lain down with greater satisfaction upon his canopied bed, than I did upon the stony floor of this tomb in Petra. In the front part of it was a large chamber, about twenty-five feet square and ten feet high; and behind this was another of smaller dimensions, furnished with receptacles for the dead, not arranged after the manner of shelves extending along the wall, as in the catacombs I had seen in Italy and Egypt, but cut lengthwise in the rock like ovens, so as to admit the insertion of the body with the feet foremost.

We built a fire in the outer chamber, thus lighting up the innermost recesses of the tombs; and after our evening meal, while sipping coffee and smoking pipes, the sheik congratulated me upon my extreme good fortune in having seen Petra without any annoyance from the Bedouins; adding, as usual, that it was a happy day for me when I saw his face at Cairo. He told me that he had never been to Wady Moussa without seeing at least thirty or forty Arabs, and sometimes 300 or 400; that when Abdel Hag (M. Linant) and M. Laborde visited Petra the first time, they were driven out by the Bedouins after remaining only five hours, and were chased down into the valley, M. Linant changing his dromedary every three hours on his way back to Akaba; that there he remained, pretending to be sick, for twenty-four days, every day feasting half the tribe: and during that time sending to Cairo for money, dresses, swords, guns, pistols, ammunition, &c., which he distributed among them so lavishly that the whole

tribe escorted him in triumph to Petra. This is so different from M. Laborde's account of his visit, that it cannot be true. I asked him about the visit of Messrs Legh and Banks, and Captains Irby and Mangles: and drawing close to me, so as not to be overheard by the rest, he told me that he remembered their visit well: that they came from Kerek with three sheiks and 300 or 400 men, and that the Bedouins of Wady Moussa turned out against them more than 2000 strong. His uncle was then the sheik, and he himself a young man: and if his account is true, which cannot however be, as it is entirely different from theirs, he began the life of a knave so young, that though he had no great field for exercise, he ought then to have been something of a proficient; he said, that while they were negotiating and parleying, one of the strange Arabs slipped into his hands a purse with 100 pieces of gold, which he showed to his uncle, and proposed to him that they should use their influence to procure the admission of the strangers, and divide the money between them; and so wrought upon the old man that he procured their entrance, telling the tribe that one of the strangers was sick, and, if they did not admit them into Wady Moussa, he would take them to his tent; and, added the sheik, his eyes sparkling with low cunning, my uncle and I ate the whole of that gold without any one of the tribe knowing any thing about it.

One piece of information he gave me, which I thought very likely to be true; that the road to Petra, and thence through Idumea in any direction, never could be pursued with assurance of safety, or become a frequented route, because the Bedouins would always be lying in wait for travellers, to exact tribute or presents; and although a little might sometimes content them, at others their demands would be exorbitant, and quarrels and bad consequences to the traveller would be almost sure to follow; and he added, in reference to our visit, that as soon as the Arabs should hear of a stranger having been at Petra, they would be down in swarms, and perhaps even now would follow us into the valley. I was satisfied that I had made a fortunate escape, not, perhaps, from personal danger, but from grinding exactions, if not from robbery; and, congratulating myself upon my good fortune so far, I began to feel my way for what I now regarded as important as before I had thought the journey to Petra, namely, a visit to the tomb of Aaron.

My companions opposed my going to it, saying that no Christian had ever done so; and that none but Mussulmans went there, and they only to sacrifice a sheep upon the tomb. I told them that I also designed to sacrifice, and that, like them, we regarded Aaron as a prophet; that my visit to Petra was nothing unless I made the sacrifice; and that my conscience would not be at ease unless I performed it according to my vow. This notice of my pious purpose smoothed some of the difficulties, as the Arabs knew that after the sacrifice the sheep must be eaten. The sheik was much more liberal or more indifferent than the rest, and my desire was finally assented to; although, in winding up a long discussion about the pedigree of Aaron, one of them held out to the last that Aaron was a Mussulman, and would not believe that he lived before Mahommed. He had an indefinite idea that Mahommed was the greatest man that ever lived, and in his mind this was not consistent with the idea of any one having lived before him.

My plans for the morrow being all arranged, the Bedouins stretched themselves out in the outer chamber, while I went within; and seeking out a tomb as far back as I could find, I crawled in, feet first, and found myself very much in the condition of a man buried alive. But never did a man go to his tomb with so much satisfaction as I felt. I was very tired; the night was cold, and here I was completely sheltered. I had just room enough to turn round; and the worthy old Edomite for whom the tomb was made, never slept in it more quietly than I did. Little did he imagine that his bones would one day be scattered to the winds, and a straggling American and a horde of Bedouins, born and living

thousands of miles from each other, would be sleeping quietly in his tomb, alike ignorant and careless of him for whom it was built.

## CHAPTER XXII.

A bold Endeavour.—Unexpected Obstacles.—Disadvantage of a Dress.—The Dead Sea.—A New Project.—The Tomb of Aaron.—An Alarm.—Descent of the Mountain.—An awkward Meeting.—Poetic Licence.—All's Well that ends Well.—Unexpected Difficulties.—Arab Notions of Travel.

A MAN rising from a tomb with all his clothes on does not require much time for the arrangement of his toilet. In less than half an hour we had breakfasted, and were again on our way. Forgetting all that had engrossed my thoughts and feelings the day before, I now fixed my eyes upon the tomb of Aaron, on the summit of Mount Hor. The mountain was high, towering above all the rest, bare and rugged to its very summit, without a tree or even a bush growing on its sterile side; and our road lay directly along its base. The Bedouins again began to show an unwillingness to allow my visit to the tomb; and the sheik himself told me that it would take half the day, and perhaps be the means of bringing upon me some of the horde I had escaped. I saw that they were disposed to prevent me from accomplishing my object; and I felt sure that, if we met any strange Arabs, my purpose would certainly be defeated. I suspected them of stratagem, and began to think of resorting to stratagem for myself. They remembered the sheep, however, and told me that the sacrifice could as well be performed at the base as on the summit of the mountain; but this, of course, would not satisfy my conscience.

With my eyes constantly fixed on the top of the mountain, I had thought for some time that it would not be impracticable to ascend from the side on which I was. Paul and I examined the localities as carefully as a couple of engineers seeking an assailable place to scale the wall of a fortified city; and afraid to wait till they had matured some plan of opposing me, I determined to take them by surprise; and throwing myself from my horse, and telling Paul to say we would climb the mountain here, and meet them on the other side, I was almost out of hearing before they had recovered from their astonishment. Paul followed me, and the sheik and his men stood for some time without moving, irresolute what to do; and it was not until we had advanced considerably on the mountain, that we saw the caravan again slowly moving along its base. None of them offered to accompany us, though we should have been glad to have one or two with us on our expedition.

For some distance we found the ascent sufficiently smooth and easy—much more so than that of Mount Sinai—and, so far as we could see before us, it was likely to continue the same all the way up. We were railing at the sheik for wanting to carry us round to the other side, and congratulating ourselves upon having attempted it here, when we came to a yawning and precipitous chasm, opening its horrid jaws almost from the very base of the mountain. From the distance at which we had marked out our route, the inequalities of surface could not be distinguished, but here it was quite another thing. We stood on the brink of the chasm, and looked at each other in blank amazement; and at a long distance, as they wound along the base of the mountain, I thought I could see a quiet smile of derision lighting up the grim visages of my Bedouin companions. We stood upon the edge of the chasm, looking down into its deep abyss, like the spirits of the departed lingering on the shores of the Styx, vainly wishing for a ferryman to carry us over, and our case seemed perfectly hopeless without some such aid. But the days when genii and spirits lent their kind assistance to the sons of men are gone; if a man finds himself in a ditch, he must get out of it as well as he can, and so it was with us on the brink of this chasm. Bad, however, as was our prospect in looking forward, we had not yet begun to look back; and as soon as we saw that there

was no possibility of getting over it, we began to descend; and groping, sliding, jumping, and holding on with hands and feet, we reached the bottom of the gully; and, after another hard half hour's toil, were resting our wearied limbs upon the opposite brink, at about the same elevation as that of the place from which we had started.

This success encouraged us; and without caring or thinking how we should come down again, we felt only the spirit of the seaman's cry to the trembling sailor boy, "Look aloft, you lubber;" and looking aloft, we saw through a small opening before us, though still at a great distance, the white dome that covered the tomb of the first high-priest of Israel. Again with stout hearts we resumed our ascent; but, as we might reasonably have supposed, that which we had passed was not the only chasm in the mountains. What had appeared to us slight inequalities of surface, we found great fissures and openings, presenting themselves before us in quick succession; not, indeed, as absolute and insurmountable barriers to farther progress, but affording us only the encouragement of a bare possibility of crossing them. The whole mountain, from its base to its summit, was rocky and naked, affording not a tree or bush to assist us; and all that we had to hold on by were the rough and broken corners of the porous sandstone rocks, which crumbled in our hands and under our feet, and more than once put us in danger of our lives. Several times, after desperate exertion, we sat down perfectly discouraged at seeing another and another chasm before us, and more than once we were on the point of giving up the attempt, thinking it impossible to advance any farther; but we had come so far, and taken so little notice of our road, that it was almost as impossible to return; and a distant and accidental glimpse of the whitened dome would revive our courage, and stimulate us to another effort. Several times I mounted on Paul's shoulders, and with his help reached the top of a precipitous or overhanging rock, where, lying down with my face over the brink, I took up the pistols, swords, &c., and then helped him up in turn; sometimes, again, he was the climber, and my shoulders were the stepping-stone; and in the rough grasps that we gave each other, neither thought of the relation of master and servant. On the sides of that rugged mountain, so desolate, so completely removed from the world, whose difficult ascent had been attempted by few human footsteps since the days when "Moses and Aaron went up in sight of all the congregation," the master and the man lay on the same rock, encountering the same fatigues and dangers, and inspired by the same hopes and fears. My dress was particularly bad for the occasion; for, besides the encumbrance of pistols and a sword, my long silk gown and large sleeves were a great annoyance, as I wanted every moment a long reach of the arm, and full play of the legs; even our light Turkish slippers were impediments in our desperate scramble, and we were obliged to pull them off, for the better hold that could be taken with the naked feet.

It will be remembered that we were ascending on the eastern side of the mountain; and in one of our pauses to breathe, when about half way up, we looked back upon the high rampart of rocks that enclosed the city of Petra; and on the outside of the rock we saw the façade of a beautiful temple, resembling in its prominent features, but seeming larger and more beautiful than, the Khasne of Pharaoh, opposite the principal entrance of the city. I have no doubt that a visit to that temple would have abundantly repaid me for the day I should have lost; for besides its architectural beauty, it would have been curious to examine, and, if possible, discover why it was constructed, standing alone outside of the city, and, as it appeared, apart from every thing connected with the habitations of the Edomites. But as yet we had work enough before us. Disencumbering ourselves of all our useless trappings, shoes, pistols, swords, tobacco-pouch, and water-sack, which we tied together in a sash and the roll of a turban, by dint of climbing, pushing, and lifting each other, after the most arduous upward scramble I ever accomplished,

we attained the bald and hoary summit of the mountain; and before we had time to look around, at the extreme end of the desolate valley of El Ghor, our attention was instantly attracted and engrossed by one of the most interesting objects in the world, and Paul and I exclaimed at the same moment, "The Dead Sea!" Lying between the barren mountains of Arabia and Judea, presenting to us from that height no more than a small, calm, and silvery surface, was that mysterious sea which rolled its dark waters over the guilty cities of Sodom and Gomorrah; over whose surface, according to the superstition of the Arabs, no bird can fly, and in whose waters no fish can swim; constantly receiving in its greedy bosom the whole body of the Jordan, but, unlike all other waters, sending forth no tribute to the ocean. A new idea entered my mind. I would follow the desert valley of El Ghor to the shores of the Dead Sea, along whose savage borders I would coast to the ruined Jericho and the hallowed Jordan, and search in its deadly waters for the ruins of the doomed and blasted cities.

If I had never stood on the top of Mount Sinai, I should say that nothing could exceed the desolation of the view from the summit of Mount Hor, its most striking objects being the dreary and rugged mountains of Seir, bare and naked of trees and verdure, and heaving their lofty summits to the skies, as if in a vain and fruitless effort to excel the mighty pile, on the top of which the high-priest of Israel was buried. Before me was a land of barrenness and ruin, a land accursed by God, and against which the prophets had set their faces; the land of which it is thus written in the Book of Life—"Moreover, the word of the Lord came unto me, saying, Son of man, set thy face against Mount Seir, and prophesy against it, and say unto it, Thus saith the Lord God, Behold, oh Mount Seir, I am against thee, and I will stretch out mine hand against thee, and I will make thee most desolate. I will lay thy cities waste, and thou shalt be desolate; and thou shalt know that I am the Lord. Because thou hast had a perpetual hatred, and hast shed the blood of the children of Israel by the force of the sword in the time of their calamity, in the time that their iniquity had an end: therefore, as I live, saith the Lord God, I will prepare thee unto blood, and blood shall pursue thee: sith thou hast not hated blood, even blood shall pursue thee. Thus will I make Mount Seir most desolate, and cut off from it him that passeth out and him that returneth. And I will fill his mountains with his slain men: in thy hills, and in thy valleys, and in all thy rivers, shall they fall that are slain with the sword. I will make thee perpetual desolations, and thy cities shall not return: and ye shall know that I am the Lord."—Ezekiel, xxxv.

The Bible account of the death of Aaron is—"And the children of Israel, even the whole congregation, journeyed from Kadesh, and came unto Mount Hor. And the Lord spake unto Moses and Aaron in Mount Hor, by the coast of the land of Edom, saying, Aaron shall be gathered unto his people: for he shall not enter into the land which I have given unto the children of Israel, because ye rebelled against my word at the water of Meribah. Take Aaron and Eleazar his son, and bring them up unto Mount Hor; and strip Aaron of his garments and put them upon Eleazar his son: and Aaron shall be gathered unto his people, and shall die there. And Moses did as the Lord commanded: and they went up unto Mount Hor in the sight of all the congregation. And Moses stripped Aaron of his garments, and put them upon Eleazar his son; and Aaron died there in the top of the mount: and Moses and Eleazar came down from the mount. And when all the congregation saw that Aaron was dead, they mourned for Aaron thirty days, even all the house of Israel."—Numbers, xx.

On the very "top of the mount," revered alike by Mussulmans and Christians, is the tomb of Aaron. The building is about thirty feet square, containing a single chamber; in front of the door is a tombstone, in form

like the oblong slabs in our churchyards, but larger and higher; the top rather larger than the bottom, and covered with a ragged pall of faded red cotton in shreds and patches. At its head stood a high round stone, on which the Mussulman offers his sacrifices. The stone was blackened with smoke; stains of blood and fragments of burnt brush were still about it; all was ready but the victim; and when I saw the reality of the preparations, I was very well satisfied to have avoided the necessity of conforming to the Mussulman custom. A few ostrich eggs, the usual ornaments of a mosque, were suspended from the ceiling, and the rest of the chamber was perfectly bare. After going out, and from the very top of the tomb surveying again and again the desolate and dreary scene that presented itself on every side, always terminating with the distant view of the Dead Sea, I returned within; and examining once more the tomb and the altar, walked carefully around the chamber. There was no light except what came from the door; and in groping in the extreme corner on one side, my foot descended into an aperture in the floor. I put it down carefully, and found a step, then another, and another, evidently a staircase leading to a chamber below. I went down till my head was on the level of the floor, but could see nothing; all was dark, and I called to Paul to strike a light. Most provokingly, he had no materials with him. He generally carried a flint and steel for lighting his pipe with; but now, when I most wanted it, he had none. I went back to the staircase, and, descending to the bottom of the steps, attempted to make out what the place might be; but it was utterly impossible. I could not see even the steps on which I stood. I again came out, and made Paul search in all his pockets for the steel and flint. My curiosity increased with the difficulty of gratifying it; and in a little while, when the thing seemed to be utterly impossible, with this hole unexplored, Petra, Mount Hor, and the Dead Sea, appeared to lose half their interest. I ran up and down the steps, inside and out, abused Paul, and struck stones together in the hopes of eliciting a spark; but all to no purpose. I was in an agony of despair, when I found myself grasping convulsively the handle of my pistol. A light broke suddenly upon me. A pile of dry brush and cotton rags lay at the foot of the sacrificial altar; I fired my pistol into it, gave one puff, and the whole mass was in a blaze. Each seized a burning brand, and we descended. At the foot of the steps was a narrow chamber, at the other end an iron grating, opening in the middle, and behind the grating a tomb cut in the naked rock, guarded and revered as the tomb of Aaron. I tore aside the rusty grating, and thrusting in my arm up to the shoulders, touched the hallowed spot. The rocks and mountains were echoing the discharge of my pistol, like peals of crashing thunder; and while, with the burning brand in one hand, I was thrusting the other through the grating, the deafening reverberations seemed to rebuke me for an act of sacrilege, and I rushed up the steps like a guilty and fear-stricken criminal. Suddenly I heard from the foot of the mountain a quick and irregular discharge of fire-arms, which again resounded in loud echoes through the mountains. It was far from my desire that the bigoted Mussulmans should come upon me, and find me with my pistol still smoking in my hand, and the brush still burning in the tomb of the prophet; and tearing off a piece of the ragged pall, we hurried from the place and dashed down the mountain on the opposite side, with a speed and recklessness that only fear could give. If there was room for question between a scramble or a jump, we gave the jump; and when we could not jump, our shoes were off in a moment; one leaned over the brow of the precipice, and gave the other his hand, and down we went, allowing nothing to stop us. Once for a moment we were at a loss; but Paul, who, in the excitement of one successful leap after another, had become amazingly confident, saw a stream of water, and made for it with the glorious boast that where water descended we could; and the suggestion proved correct, although the water found

much less difficulty in getting down than we did. In short, after an ascent the most toilsome, and a descent the most hair-brained and perilous it was ever my fortune to accomplish, in about half an hour we were at the base of the mountain, but still hurrying on to join our escort.

We had only to cross a little valley to reach the regular camel-track, when we saw from behind a slightly elevated range of rocks the head and long neck of a dromedary; a Bedouin was on his back, but, riding sideways, did not see us. Another came, and another, and another; then two or three, and, finally, half a dozen at a time, the blackest, grimmest, and ugliest vagabonds I had ever yet seen. A moment before Paul and I had both complained of fatigue, but it is astonishing how the sight of these honest men revived us; any one seeing the manner in which we scoured along the side of the mountain, would have thought that all our consciousness was in our legs. The course we were pursuing when we first saw them would have brought us on the regular camel-track a little in advance of them, but now our feet seemed to cling to the sides of the mountain. We were in a humour for almost calling on the rocks to fall upon us and cover us; and if there had been a good dodging-place, I am afraid I should here have to say that we had taken advantage of it until the very unwelcome caravan passed by; but the whole surface of the country, whether on mountain side or in valley's depth, was bare and naked as a floor; there was not a bush to obstruct the view; and soon we stood revealed to these unpleasant witnesses of our agility. They all shouted to us at once; and we returned the salute, looking at them over our shoulders, but pushing on as fast as we could walk. In civilised society, our course of proceeding would have been considered a decided cut; but the unmannerly savages did not know when they received a civil cut, and were bent on cultivating our acquaintance. With a loud shout, slipping off their camels and whipping up their dromedaries, they left the track, and dashed across the valley to intercept us. I told Paul that it was all over, and now we must brazen it out; and we had just time to turn around and reconnoitre for a moment, before we were almost trodden under foot by their dromedaries.

With the accounts that we had read and heard of these Bedouins, it was not a pleasant thing to fall into their hands alone; and without the protection of the sheik, we had reason to apprehend bad treatment. We were on a rising ground; and as they came bounding towards us, I had time to remark that there was not a gun or pistol among them; but every one, old and young, big and little, carried an enormous sword slung over his back, the hilt coming up towards the left shoulder, and in his hand a large club, with a knot at the end as large as a doubled fist. Though I had no idea of making any resistance, it was a satisfaction to feel that they might have some respect for our fire-arms; as even a Bedouin's logic can teach him, that though a gun or pistol can kill but one, no man in a crowd can tell but that he may be that one. Our armoury, however, was not in the best condition for immediate use. I had fired one of my pistols in the tomb of Aaron, and lost the flint of the other; and Paul had burst the priming cap on one of his barrels, and the other was charged with bird-shot.

It seemed that there was nothing hostile in their intentions; for though they came upon us with a wild and clamorous shout, their dark eyes appeared to sparkle with delight as they shook us by the hand, and their tumultuous greeting, to compare small things with great, reminded me of the wild welcome which the Arabs of Saladin gave to the litter of the Queen of England, when approaching the Diamond of the Desert on the shores of the Dead Sea. Nevertheless, I looked suspiciously upon all their demonstrations of good will; and though I returned all their greetings, even to the kiss on their black faces, I would rather have been looking at them through the bars of an iron grating. But Paul behaved like a hero, although he was a supreme coward, and

admitted it himself.\* I knew that every thing depended upon him; but they had come upon us in such a hurry, and so few words had passed between us, that I had no idea how he stood affected. His first words reassured me; and really, if he had passed all his life in taming Bedouins, he could not have conducted himself more gallantly or sensibly. He shook hands with one, took a pipe from the mouth of another, kicked the dromedary of a third, and patted his owner on the back, smoking, laughing, and talking all the time, ringing the changes upon the Sheik El Alouin, Habeeb Effendi, and Abdel Hasis. I knew that he was lying, from his remarkable amplitude of words, and from his constantly mixing up Abdel Hasis (myself) with the Habeeb Effendi, the prime minister of the pacha; but he was going on so smoothly that I had not the heart to stop him; and, besides, I thought he was playing for himself as well as for me, and I had no right to put him in danger by interfering. At length, all talking together, and Paul's voice rising above the rest, in force as well as frequency, we returned to the track, and proceeded forward in a body to find the sheik.

Not to be too heavy on Paul for the little wanderings of his tongue, I will barely mention such as he remembered himself. Beginning with a solemn assurance that we had not been in Wady Moussa or Petra (for this was his cardinal point), he affirmed that I was a Turk making a pilgrimage to the tomb of Aaron under a vow; and that, when Sheik El Alouin was in Cairo, the Habeeb Effendi had taken me to the sheik's tent, and had told him to conduct me to Djebel Haroun, or Mount Hor, and from thence to Hebron (Khalil), and that, if I arrived in safety, he, the Habeeb Effendi, would pay him well for it. We went on very well for a little while; but by and bye the Bedouins began talking earnestly among themselves, and a fine, wicked-looking boy, leaning down from the hump of his bare-backed dromedary, with sparkling eyes thrust out his hand and whispered bucksheesh; an old dried-up man echoed it in a hoarse voice directly in my ears; and one after another joined in, till the whole party, with their deep-toned gutturals, were croaking the odious and ominous demand that grated harshly on my nerves. Their black eyes were turned upon me with a keen and eager brightness; the harsh cry was growing louder every moment; and I had already congratulated myself upon having very little about my person, and Paul was looking over his shoulders, and flourishing the Habeeb Effendi and the Sheik El Alouin with as loud a voice as ever, but evidently with a fainting heart; bucksheesh, bucksheesh, bucksheesh, was drowning every other noise, when a sudden turn in the road brought us upon the sheik and his attendants. The whole party were in confusion; some were descending the bare sides of the mountains, others were coming down with their dromedaries upon a full run; the sheik's brother, on my horse, was galloping along the base; and the sheik himself, with his long red dress streaming in the wind, and his spear poised in the air, was dashing full speed across the plain. All seemed to catch a glimpse of us at the same moment, and at the same moment all stopped. The sheik stood for a little space, as if astonished and confounded at seeing us attended by such an escort; and then spurring again his fiery horse, moved a few paces towards us, and dismounting, struck his spear in the sand, and waited to receive us. The men came in from all quarters; and almost at the same moment all had gathered around the spear. The sheik seemed more alarmed than any of us, and Paul said he turned perfectly green. He had heard the report of the pistol, which had given him much uneasiness; the men had answered, and scattered themselves abroad in search

of us; and now seeing us come up in the midst of such a horde of Bedouins, he supposed that we had opened an account which could only be settled with blood.

The spirit of lying seemed to have taken possession of us. Thinking it would not be particularly acceptable to my pious friends to hear that I had been shooting in the tomb of Aaron, I told Paul to say that we had shot at a partridge. Even before saluting the strangers, with a hurried voice and quivering lip the sheik asked the cause of our firing; and when Paul told him, according to my instructions, that the cause was merely a simple bird, he was evidently relieved, although, unable to master his emotion, he muttered, "Cursed be the partridge, and the emsuf, and cursed the hand that fired it." He then saluted our new companions, and all sat down around his long spear to smoke and drink coffee. I withdrew a little apart from them, and threw myself on the ground, and then began to suffer severely from a pain which, in my constant excitement since the cause of it occurred, I had not felt. The pistol which I fired in the tomb had been charged by Paul with two balls, and powder enough for a musket; and in the firing it recoiled with such force as to lay open the back of my hand to the bone. While I was binding it up as well as I could, the sheik was taking care that I should not suffer from my withdrawal. I have mentioned Paul's lying humour, and my own tendency that way; but the sheik cast all our doings in the shade; and particularly, as if it had been concerted beforehand, he averred most solemnly, and with the most determined look of truth imaginable, that we had not been in Wady Moussa; that I was a Turk on a pilgrimage to Mount Hor; that when he was in Cairo waiting for the caravan of pilgrims, the pacha sent the Habeeb Effendi to conduct him to the citadel, whither he went, and found me sitting on the divan by the side of the pacha; that the pacha took me by the hand, told him that I was his (the pacha's) particular friend, and that he, Sheik El Alouin, must conduct me first to Mount Hor, and then to Khalil or Hebron, and that he had given his head to Mahommed Ali for my safety. Paul was constantly moving between me and the group around the spear, and advising me of the progress of affairs; and when I heard who I was, and of my intimacy with the pacha, thinking that it was not exactly the thing for the particular friend of the Viceroy of Egypt to be sprawling on the sand, I got up, and, for the credit of my friend, put myself rather more upon my dignity. We remained here half an hour, when, seeing that matters became no worse, I took it for granted that they were better; and, after moving about a little, I began to arrange the saddle of my horse; and by and bye, as a sort of declaration of independence, I told them that I would ride on slowly, and they could follow at their convenience. The sheik remained to settle with my new friends. They were a caravan belonging to the El Alouin tribe, from the tents at the mouth of the entrance to Petra, now on their way to Gaza; and the sheik got rid of them by paying them something, and assuring them that we had not been in Petra.

Early in the afternoon a favourite camel was taken sick, stumbled, and fell; and we turned aside among the mountains, where we were completely hidden from the view of any passing Bedouins. The camel belonged to a former female slave of the sheik, whom he had manumitted and married to "his black," and to whom he had given a tent, and this camel as a dowry. He had been very anxious to get away as far as possible from Wady Moussa that night; but as soon as the accident happened, with the expression always uppermost in the mouth of the followers of the Prophet, "God wills it," he began to doctor the animal. It was strange to be brought into such immediate contact with the disciples of fatalism. If we did not reach the point we were aiming at, God willed it; if it rained, God willed it; and I suppose that, if they had happened to lay their black hands upon my throat, and stripped me of every thing I possessed, they would have piously raised their eyes to heaven, and cried, "God willed it." I remember

\* Paul's explanation of his cowardice was somewhat remarkable, and perhaps veracious. He said that he was by nature brave enough, but that, when travelling in Syria, about three years before, with Mr Wellesley—a natural son of the Duke of Wellington—their party was stopped by Arabs, and their two kervashes, without any parley, raised their muskets and shot two of the poor savages dead before his face; which had such an effect upon his nerves as to give him a horror of lead and cold steel ever since.

Mr Wolff,\* the converted Jew missionary, told me an anecdote illustrating most strikingly the operation of this fatalist creed. He was in Aleppo during an earthquake, and saw two Turks smoking their pipes at the base of a house then tottering and ready to fall. He cried out to them and warned them of their peril; but they turned their eyes to the impending danger, and crying, "Allah el Allah," "God is merciful," were buried under the ruins.

It was not more than four o'clock when we pitched our tent. The Arabs all came under the shade to talk more at ease about our ascent of Mount Hor, and our adventure with the Bedouins of Wady Moussa; and wishing to show them that we Christians conceived ourselves to have some rights and interests in Aaron, I read to them, and Paul explained, the verses in the Bible recording his death and burial on the mountain. They were astonished and confounded at finding any thing about him in a book; records of travel being entirely unknown to them, and books, therefore, regarded as of unquestionable veracity. The unbeliever of the previous night, however, was now as obstinate as if he had come from the banks of the Zuyder Zee. He still contended that the great high-priest of the Jews was a true follower of the Prophet; and I at last accommodated the matter by allowing that he was not a Christian.

That evening Paul and the sheik had a long and curious conversation. After supper, and over their pipes and coffee, the sheik asked him, as a brother, why we had come to that old city, Wady Moussa, so long a journey through the desert, spending so much money; and when Paul told him it was to see the ruins, he took the pipe from his mouth and said, "That will do very well before the world; but, between ourselves, there is something else;" and when Paul persisted in it, the sheik said to him, "Swear by your God that you do not come here to search for treasure;" and when Paul had sworn by his God, the sheik rose, and, pointing to his brother as the very acme of honesty and truth, said, after a moment's hesitation, "Osman, I would not believe it if that brother had sworn it. No," he continued; "the Europeans are too cunning to spend their money in looking at old stones. I know there is treasure in Wady Moussa; I have dug for it, and I mean to dig for it again;" and then again he asked Paul whether he had discovered any, and where; telling him that he would aid in removing it, without letting any of the rest of the tribe know any thing of the matter.

#### CHAPTER XXIII.

Valley of El Ghor.—Prophecies against Edom.—The Sheik's Treachery.—An Explosion.—Personnel of the Arabs.—Amusing Retrospect.—Money Troubles.—Aspect of the Valley.—Death of a Camel.—The Desert Horses.—Native Salt.

EARLY in the morning we continued our descent down the mountain. Every turn was presenting us with a new view of wild, barren, and desolate scenery; and yet frequently, in little spots watered by the mountain streams, we saw shrubs, and patches of green grass, and odoriferous bushes. At about nine o'clock we were again at the foot of the mountains of Seir, again moving along the great desert valley of El Ghor; and again I saw, in imagination, at the extreme end of the valley,

\* The Rev. Joseph Wolff is now in America, and has taken orders in the Episcopal Church. When I left Egypt, he had set out on his long-projected journey to Timbuctoo. He was taken sick in Abyssinia, and, unable to continue his progress, under great personal hardship and suffering, crossed the desert to the Red Sea, and went down to Bombay. It is greatly to be regretted that Mr Wolff's health failed him. From his extensive travels in Asia and Africa, and his intimate knowledge of the languages and customs of the wild tribes that roam over their deserts, he was probably better qualified, and had a better chance of reaching that city, than any other man now living. It will probably be long before the attempt is made by another. Mr Wolff has not, however, abandoned his purpose. As soon as his health will permit, he intends to resume his journey; and if the difficulties and dangers are not greater than man can overcome, we may yet hear from him in the heart of Africa.

that mysterious sea which I had first looked upon from the summit of Mount Hor. I had spoken to the sheik before, and again I tried to prevail upon him to follow the valley directly to its shores; but he told me, as before, that he had never travelled that road, and the Bedouins (whom he had last night declared to be total strangers) were deadly enemies of his tribe; in short, it was impossible to prevail upon him; and, as I found afterwards, it would have been physically impossible to proceed along the mountainous borders of the sea.

We pursued the route which I had originally contemplated, through the land of Idumea. In regard to this part of my journey I wish to be particularly understood. Three different parties, at different times, and under different circumstances, after an interval of twenty years from its discovery by Burekhardt, had entered the city of Petra, but not one of them had passed through the land of Idumea. The route of the two Englishmen and Italian before referred to was not precisely known; and, with the exception of these three, I was the first traveller who had ever attempted to pass through the doomed and blighted Edom. In very truth, the prophecy of Isaiah, "None shall pass through it for ever and ever," seemed in a state of literal fulfilment. And now, without considering that I was perhaps braving the malediction of Heaven, but stimulated by the interest of associations connected with the denounced region, and the excitement of travelling over a new and unbeaten track, I was again moving along the desert valley of El Ghor.

In the present state of the world, it is an unusual thing to travel a road over which hundreds have not passed before. Europe, Asia, and even the sands of Africa, have been overrun and trodden down by the feet of travellers; but in the land of Idumea, the oldest country in the world, the aspect of every thing is new and strange, and the very sands you tread on have never been trodden by the feet of civilised human beings. The Bedouin roams over them like the Indian on our native prairies. The road along which the stranger journeys was far better known in the days of David and Solomon than it is now; and when he tires with the contemplation of barrenness and ruin, he may take the Bible in his hand, and read what Edom was, and how God, by the mouth of his prophets, cursed it; and see with his own eyes whether God's words be true. "Also Edom shall be a desolation; every one that goeth by it shall be astonished and shall hiss at all the plagues thereof. As in the overthrow of Sodom and Gomorrah, and the neighbouring cities thereof, saith the Lord, no man shall abide there, neither shall a son of man dwell in it. Therefore, hear the counsel of the Lord that he hath taken against Edom, and his purposes that he hath purposed against the inhabitants of Teman; surely the least of the flock shall draw them out; surely he shall make their habitations desolate with them. The earth is moved at the noise of their fall, at the cry, the noise thereof was heard in the Red Sea."—Jeremiah, xlix. And again—"Thus saith the Lord God: Because that Edom hath dealt against the house of Judah by taking vengeance, and hath greatly offended, and revenged himself upon them; therefore, thus saith the Lord God, I will also stretch out mine hand upon Edom, and will cut off man and beast from it; and I will make it desolate from Teman."—Ezekiel, xxv. "Edom shall be a desolate wilderness."—Joel, iii. 19. "For three transgressions of Edom, and for four, I will not turn away the punishment thereof."—Amos, i. 11. "Thus saith the Lord God concerning Edom: Behold, I have made thee small among the heathen: thou art greatly despised. The pride of thine heart hath deceived thee, thou that dwellest in the clefts of the rock, whose habitation is high; that saith in his heart, Who shall bring me down to the ground? Though thou exalt thyself as the eagle, and though thou set thy nest among the stars, thence will I bring thee down, saith the Lord. Shall I not in that day, saith the Lord, even destroy the wise men out of Edom, and understanding out of the Mount of Esau? And thy mighty men, oh Teman, shall be

dismayed, to the end that every one of the Mount of Esau may be cut off by slaughter."—Obadiah, i.

All that day the sheik was particularly disagreeable. He was constantly talking of the favourable circumstances under which I had seen Petra, the bad character of the Bedouins, his devotion to me, and the generosity of M. Laborde and Abdel Hag. Ever since we started, one of his standing subjects of conversation with Paul had been what he expected from me; and to-day he pressed him particularly, to learn how much money I had brought with me. In the evening he came to my tent. He was in the habit of coming in every evening; and though I did not like him, I was in the habit of talking with him; and, according to the Arab custom, I always asked him to take a share of my meal. In general, appease the stomach, and you gain the heart of the Arab; but the viscera of my sheik were of impenetrable toughness. They produced none of that delicious repose, that "peace on earth, and good-will towards all men" spirit, which comes over an honest man after dinner. "A child might play with me," said the good-hearted son of Erin, as he threw himself back in his chair after dinner; but it was not so with my sheik. While he was eating my bread, he was plotting against me. I had smoked my pipe, and was lying on my mat reading, while a long conversation was going on between him and Paul, and my suspicions were aroused; for, on the part of the sheik, it was carried on in a low whisper. Though he knew I could not understand a word, he had the indefinite fear that indicates a guilty intention; and, as I looked up occasionally from my book, I saw his keen and cunning eyes turned towards me, and withdrawn as soon as they met mine. He remained there more than an hour, conversing in the same low whisper—I, meanwhile, watching his looks from time to time; and when he had gone, I asked what it all meant. At first Paul hesitated, but finally said, that it was the old story about Abdel Hag's generosity, and what he expected from me; for himself, the sheik expected at least 250 dollars; his brother would not expect so much; but that he was on an entirely different footing from the men; and he had concluded, by attempting to bribe Paul, to find out how much money I had with me, and how much I intended to give him; and, in going out, had slipped a couple of pieces into Paul's hand as an earnest. I have not troubled the reader with the many petty difficulties I had with the sheik, nor the many little circumstances that were constantly occurring to irritate me against him. I had been several times worked up to such a pitch that it was difficult to keep within the bounds of prudence; and I now broke through all restraints. From the beginning he had been exaggerating the danger of the road, and making a parade of devotion and the value of his services; and only the last night I had been driven out of my tent by four enormous fires which he had built at the four corners, as he said, for the men to sleep by and keep guard. I could hardly restrain myself then; but merely telling him that I would rather be robbed than roasted, I reserved myself for a better moment. The fact is, from the beginning I had been completely mistaken in my opinion touching the character of the chief of a powerful tribe of Bedouins. I had imagined him like the chief of a tribe of our own Indians, wild, savage, and lawless, but generous and true when he had once offered his protection; one who might rob or even murder, but who would never descend to the meanness of trickery and falsehood.

I had been smothering my feelings of contempt through the whole journey; but now I had seen Petra and Mount Hor, and it was a relief to have something to justify me in my own eyes in breaking through all restraint. I had caught him in the very act of baseness and villany, corrupting the faith of my servant; bribing under my own eyes, and while eating my bread, the only man on whom I could rely at all; and the proof of his treason, the accursed gold, was before me. With a loud voice I called him back to the tent, and charged him with his baseness, reproaching him that I

had come into the desert upon the faith of his promises, and he had endeavoured to corrupt my servant before my eyes; I told him that he was false and faithless; that I had before distrusted him, but that I now despised him, and would not give him a para till we got to Hebron, nor would I tell him how much I would give him then; but that, if he would take himself off and leave me alone in the desert, I would pay him the price of his camels; I assured him that, bad as he represented them, I did not believe there was a worse Arab in all his tribe than himself; and, finally, throwing open my trunk, I told him I did not fear him or all his tribe; that I had there a certain sum of money, which should belong to the man who should conduct me to Hebron, whoever he might be, and clothes which would not suit an Arab's back; that I knew I was in his power; but that, if they killed me, they could not get more than they could without it; and added, turning my pistols in my belt, that they should not get it while I could defend it. All this, passing through an interpreter, had given me time to cool; and before coming to my grand climax, though still highly indignant, I was able to observe the effect of my words. At the first glance I saw I had the vantage ground, and that the consciousness of being detected in his baseness sealed his lips. I am inclined to think that he would have been disgraced in the eyes of his tribe if they had been acquainted with the circumstances; for instead of resenting my passionate language, he earnestly begged me to lower my voice, and frequently looked out of the tent to see if any of his companions were near. Keep cool, is a good maxim, generally, in a man's walk through life, and it is particularly useful with the Bedouins in the desert; but there are times when it is good to be in a passion, and this was one of them. Without attempting to resent what I said, even by word or look, he came up to me, kissed my hand, and swore that he would never mention the subject of bucksheesh again until we got to Hebron, and he did not. I retained my command over him through the whole journey, while he was constantly at my side, taking my horse, holding my stirrup, and in every way trying to make himself useful. I am not sure, however, but that in his new character of a sycophant he was worse than before. A sycophant in civilised life, where the usages of society admit and perhaps demand a certain degree of unmean civility, is the most contemptible thing that crawls; but in a wild Arab it was intolerable. I really despised him, and made no secret of it; and sometimes, rash and imprudent as was the bare thought, it was with difficulty that I could keep from giving him my foot. After he had gone out, Paul sewed twenty gold pieces in the collar of my jacket, and I left the rest of my money open in my trunk.

I have frequently been astonished at the entire absence of apprehension which accompanied me during the whole of this journey. I fortunately observed, at the very first, an intention of exaggerating its danger; and this and other little things carried me into the other extreme, to such a degree, that perhaps my eyes were closed against the real dangers. Among all the pictures and descriptions of robbers and bandits that I have seen, I have never met with anything so unprepossessing as a party of desert Arabs coming down upon the traveller on their dormitories; but one soon gets over the effect of their dark and scowling visages; and after becoming acquainted with their weapons and bodily strength, a man of ordinary vigour, well armed, feels no little confidence in himself among them. They are small in stature, under our middle size, and thin almost to emaciation. Indeed, the same degree of spareness in Europeans would be deemed the effect of illness or starvation; but with them it seems to be a mere drying up of the fluids, or, as it were, an attraction between skin and bone, which prevents flesh from insinuating itself between. Their breast-bones stand out very prominently; their ribs are as distinctly perceptible as the bars of a gridiron, and their empty stomachs seem drawn up till they touch the back bone; and their weapons, though ugly enough, are far from being formidable.

The sheik was the only one of our party who carried pistols, and I do not believe they could have been discharged without picking the flints once or twice; the rest had swords and matchlock guns; the latter, of course, not to be fired without first striking a light, which is not the work of a moment; and although these inconvenient implements do well enough for contests with their brother Bedouins, the odds are very much against them when they have to do with a well-armed Frank; two pairs of good pistols and a double-barrelled gun would have been a match for all our matchlock muskets. Besides all this, one naturally feels a confidence in himself after being some time left to his own resources; a development of capacities and energies which he is entirely unconscious of possessing, until he is placed in a situation to call them out. A man must have been in the desert alone, and beyond the reach of help, where his voice can never reach the ears of his distant friends, with a strong and overwhelming sense that every thing depends upon himself, his own coolness and discretion; and such is the elasticity of the human character, that his spirit, instead of sinking and quailing as it would once have done under difficulties and dangers incomparably less, rises with the occasion; and as he draws his sash or tightens his sword-belt, he stretches himself to his full length, and is prepared and ready for any emergency that may befall him. Indeed, now that I have returned to the peaceful occupations of civilised life, I often look back with a species of mirthful feeling upon my journey in the desert as a strange and amusing episode in my life; and when laying my head on my quiet pillow, I can hardly believe that, but a few months ago, I never slept without first placing my pistols carefully by my side, and never woke without putting forth my hand to ascertain that they were near, and ready for instant use.

I had scarcely mounted the next morning before one of the men came up to me, and, telling me that he intended to return home, asked for his bucksheesh. I looked at the sheik, who was still sitting on the ground, enjoying a last sip of coffee, and apparently taking no notice of us, and it immediately occurred to me that this was another scheme of his to find out how much I intended to give. The idea had no sooner occurred to me than I determined to sustain the tone I had assumed the night before; and I therefore told the fellow that I should not pay any one a piastre until I arrived at Hebron. This occasioned a great clamour; the sheik still remained silent, but all the others took up the matter, and I do not know how far it would have gone if I had persisted. I was the only one mounted; and having given my answer, I turned my horse's head, and moved on a few paces, looking over my shoulder, however, to watch the effect; and when I saw them still standing, as if spell-bound, in the unfinished act, one of mounting a dromedary, another of arranging the baggage, and all apparently undecided what to do, I reflected that no good could come from the deliberations of such men, and began to repent somewhat of the high tone I had assumed. I only wanted a good excuse to retrace my steps; and after a moment's reflection, I laid hold of something plausible enough for immediate use. The man who wanted to return was rather a favourite with me—the same who had carried me on his shoulders up the stream in the entrance of Petra—and, returning suddenly, as if the thing had just occurred to me, I called him to me, and told him that, although I would not pay him for accompanying me on my journey, as it was not yet ended, still, for his extra services in Petra, I would not let him go destitute; that I loved him—by which I meant that I liked him, an expression that would have been entirely too cold for “the land of the East and the clime of the sun,” or, as I should rather say, for the extravagant and inflated style of the Arabs—that if the same thing had happened with any of the others, I would not have given him a para; and now he must understand that I only paid him for his services in Petra. This seemed natural enough to the other Bedouins, for they all knew that this man and I had returned from the defile the best friends in

the world, calling each other brother, &c.; and in the end, the whole affair turned out rather fortunately; for understanding me literally that I paid only for the day in Petra, although not understanding the rule of three as established in the books of arithmetic, they worked out the problem after their own fashion, “If one day gives so much, what will so many days give?” and were exceedingly satisfied with the result. Indeed, I believe I might at any time have stopped their mouths, and relieved myself from much annoyance, by promising them an extravagant sum on my arrival at Hebron; but this I would not do. I had not, from the first, held out to them any extravagant expectations, nor would I do so then; perhaps, after all, not so much from a stern sense of principle, as from having conceived a feeling of strong though smothered indignation and contempt for the sheik. Indeed, I should not have considered it safe to tell him what I intended to give him; for I soon saw that the amount estimated by Mr Gliddon and myself was very far from being sufficient to satisfy his own and his men's extravagant expectations. My apparent indifference perplexed the sheik, and he was sorely confounded by my valiant declaration, “There is my trunk; all that is in it is yours when we arrive at Hebron; rob me or kill me, and you get no more;” and though he could not conceal his eagerness and rapacity, he felt himself trammelled; and my plan was to prolong his indecision, and postpone our denouement until our arrival at Hebron. Still, it was very unpleasant to be travelling upon these terms with my protectors, and I was exceedingly glad when the journey was over.

We were again journeying along the valley in an oblique direction. In the afternoon we fell in with a caravan for Gaza. It may be that I wronged the sheik; but I had the idea that, whenever we saw strangers, his deep and hurried manner of pronouncing *El Arab*, his fixing himself in his saddle, poising his spear, and getting the caravan in order, frequently accompanying these movements with the cautioning words not to be afraid, that he would fight for me till death, were intended altogether for effect upon me. Whether he had any influence or not with the caravan for Gaza, I cannot say; but I know that I would have been glad to leave the wandering tribes of the land of Idumea, and go with my new companions to the ancient city of the Philistines. While we moved along together, Paul and myself got upon excellent terms with them, and consulted for a good while about asking them to take us under their escort. I have no doubt they would have done it willingly, for they were a fine, manly set of fellows; but we were deterred by the fear of involving them in a quarrel, if not a fight, with our own men.

The valley continued the same as before, presenting sandy hillocks, thorn-bushes, gullies, the dry beds of streams, and furnishing all the way incontestible evidence that it had once been covered with the waters of a river. To one travelling along that dreary road as a geologist, every step opens a new page in the great book of Nature; carrying him back to the time when all was chaos, and darkness covered the face of the earth; the impressions it conveys are of a confused mass of matter settling into “form and substance,” the earth covered with a mighty deluge, the waters retiring, and leaving bare the mountains above him, and a rolling river at his feet; and, by the regular operation of natural causes, the river contracting and disappearing, and for thousands of years leaving its channel-bed dry. And again, he who in the wonders around him seeks the evidences of events recorded in the sacred volume, here finds them in the abundant tokens that the shower of fire and brimstone which descended upon the guilty cities of Sodom and Gomorrah stopped the course of the Jordan, and formed it into a pestilential lake, and left the dry bed of a river in the desolate valley in which he is journeying. This valley is part of the once populous land of Idumea; in the days of Solomon, the great travelled highway by which he received the gold of Ophir for the temple; and by which, in the days of imperial Rome, the wealth of India was brought to her doors.

About the middle of the day, as usual, the sheik rode ahead, and, striking his spear in the sand, he had coffee prepared before we came up. While we were sitting around the spear, two of our camels so far forgot the calm dignity of their nature, and their staid, quiet habits, as to get into a fight; and one of them, finding himself likely to come off second best, took to his heels, and the other after him; they were baggage camels, one being charged with my boxes of provisions and housekeeping apparatus, and his movements indicated death to crockery. I will not go into particulars, for eggs, rice, macaroni, and lamp-oil, make a bad mixture; and although the race and fight between the loaded camels were rather ludicrous, the consequence was by no means a pleasant thing in the desert.

The next morning we had another camel scene, for one of the combatants was stretched upon the sand, his bed of death. The Bedouins had examined him, and, satisfied that the hand of death was upon him, they left him to breathe his last alone. The camel is to the Arab a treasure above all price. He is the only animal by nature and constitution framed for the desert, for he alone can travel several days without eating or drinking. Every part of him is useful; his milk is their drink, his flesh their food, and his hair supplies materials for their rude garments and tents. Besides this, the creature is domesticated with the Bedouin; grows up in his tent, feeds from his hand, kneels down to receive his burden, and rises as if glad to carry his master; and, in short, is so much a part of a Bedouin's family, that often, in speaking of himself, the Bedouin will say that he has so many wives, so many children, and so many camels. All these things considered, when this morning they knew that the camel must die, I expected, in a rough way, something like Sterne's picture of the old man and his ass. But I saw nothing of the kind; they left him in the last stages of his struggle with the great enemy with as much indifference, I was going to say, as if he had been a brute; and he was a brute; but it was almost worth a passing tear to leave even a brute to die alone in the desert—one that we knew, that had travelled with us, and formed part of our little world; but the only lament the sheik made was, that they had lost twenty dollars, and we left him to die in the sand. I could almost have remained myself to close his eyes. The vultures were already hovering over him, and once I went back and drove them away; but I have no doubt that before the poor beast was dead, the horrid birds had picked out his eyes, and thrust their murderous beaks into his brain.

It was, as usual, a fine day. Since we left Akaba we had a continued succession of the most delightful weather I had ever experienced. I was, no doubt, peculiarly susceptible to the influence of weather. With a malady constantly hanging about me, if I drooped, a bright sun and an unclouded sky could at any time revive me; and more than once, when I have risen flushed and feverish, and but little refreshed with sleep, the clear pure air of the morning has given me a new life. From dragging one leg slowly after the other, I have fairly jumped into the saddle, and my noble Arabian, in such cases, always completed what the fresh air of the morning had begun. Indeed, I felt then that I could not be too thankful for those two things, uncommonly fine weather and an uncommonly fine horse; and I considered that it was almost solely those two that sustained me on that journey. It is part of the historical account of the Bedouins' horses, that the mares are never sold. My sheik would have sold his soul for a price; and as soon as he saw that I was pleased with my mare, he wanted to sell her to me; and it was singular and amusing, in chaffering for this animal, to mark how one of the habits of bargain-making peculiar to the horse-jockey with us, existed in full force among the Arabs. He said that he did not want to sell her; that at Cairo he had been offered two hundred and fifty dollars, a new dress, and arms complete, and he would not sell her; but if I wanted her, there being nothing he would not do for me, &c., I might have her.

The sheik's was an extraordinary animal. The saddle had not been off her back for thirty days; and the sheik, himself a most restless creature, would dash off suddenly a dozen times a-day, on a full run across the valley, up the sides of a mountain, round and round our caravan, with his long spear poised in the air, and his dress streaming in the wind; and when he returned and brought her to a walk at my side, the beautiful animal would snort and paw the ground, as if proud of what she had done, and anxious for another course. I could almost imagine I saw the ancient war-horse of Idumea, so finely described by Job—"his neck clothed with thunder. Canst thou make him afraid as a grasshopper? the glory of his nostrils is terrible. He paweth in the valley, and rejoiceth in his strength; he goeth on to meet the armed men. He mocketh at fear, and is not affrighted; neither turneth he back from the sword. The quiver rattleth against him, the glittering spear and the shield. He swalloweth the ground with fierceness and rage; neither believeth he that it is the sound of the trumpet. He saith among the trumpets, ha, ha; and he smelleth the battle afar off, the thunder of the captains, and the shouting."

Nothing showed the hardness of these horses more than their drinking. Several times we came to deposits of rain water left in the hollow of a rock, so foul and dirty that I would not have given it to a dog; and while their sides were white with foam, the sheik would take the bits out of their mouths, and sit down with the bridle in his hands, and let them drink their fill; and I could not help thinking that a regular-bred English groom, accustomed to insinuate a wet sponge in the mouth of a heated horse, would have been amazed and horrified at such a barbarian usage. These two horses were twelve and twenty years old respectively; and the former was more like a colt in playfulness and spirit, and the other like a horse of ten with us; and the sheik told me that he could count upon the services of both until they were thirty-five. Among all the recommendations of the Arabian horse, I know none greater than this: I have known a man, from long habit, conceive a liking for a vicious jade that no one else would mount; and one can imagine how warm must be the feeling, when, year after year, the best of his race is the companion of the wandering Arab, and the same animal may bear him from the time when he can first poise a spear until his aged frame can scarcely sustain itself in the saddle.

Before leaving the valley, we found in one of the gullies a large stone veined in that peculiar manner which I had noticed at Petra; it had been washed down from the mountains of Wady Moussa, and the Arab told me that stone of the same kind was found nowhere else. Towards evening we had crossed the valley, and were at the foot of the mountains of Judea, in the direction of the southern extremity of the Dead Sea. That evening, I remember, I noticed a circumstance which called to my mind the wonderful accounts handed down to us by Strabo and other ancient historians, of large cities built of salt having stood at the southern extremity of the Dead Sea and the valley beyond. In the escape of our runaway camels, bringing about the catastrophe which one of them had since expiated with his life, they had mingled together in horrible confusion, contrary to all the rules of art, so many discordant ingredients, that a great portion of my larder was spoiled; and, among other things, salt, almost as necessary to man as bread, had completely lost its savour. But the Bedouins, habituated to wanting almost every thing, knew where to find all that their barren country could give; and one of them leaving the tents for a few moments, returned with a small quantity that he had picked up for immediate use, being a cake or encrustation about as large as the head of a barrel; and I afterwards saw regular strata of it, and in large quantities, in the sides of the mountains.

## CHAPTER XXIV.

The Road to Gaza.—Unknown Ruins.—A Misadventure.—Pastoral Bedouins.—A Flower of the Wilderness.—The Ravages of War.—Testimony of an Eyewitness.

WE started at six o'clock the next day, the morning rather cool, though clear and bracing; we were again among the mountains, and at about eleven, a track scarcely distinguishable to my eye, turned off to Gaza. To a traveller from such a country as ours, few of the little every-day wonders he is constantly noticing strike him more forcibly than the character of the great public roads in the East. He makes allowance for the natural wildness of the country, the impossibility of using wheel-carriages on the mountains, or horses in the desert as beasts of burden, but still he is surprised and disappointed. Here, for instance, was a road leading to the ancient city of Gaza, a regular caravan route for 4000 years, and yet so perfect in the wildness of nature, so undistinguishable in its appearance from other portions of the wilderness around, that a stranger would have passed the little opening in the rocks probably without noticing it, and certainly without imagining that the wild track, of which it formed the entrance, would conduct him to the birthplace and ancient capital of David, and the holy city of Jerusalem. The solitary trail of the Indian over our prairies and forests is more perfectly marked as a road than either of the great routes to Gaza or Jerusalem, and yet, near the spot where these two roads diverge, are the ruins of an ancient city.

Little, if any thing, has been known in modern days concerning the existence and distinguishing features of this road; and it is completely a terra incognita to modern travellers. All the knowledge possessed of it is that derived from the records of ancient history; and from these we learn that in the time of David and Solomon, and the later days of the Roman empire, a great public road existed from Jerusalem to Akaba, the ancient Eloth or Ezion-geber; that several cities existed upon it between these terminating points, and that their ruins should still be visible. Believing that I am the first traveller who has ever seen those ruins, none can regret more than myself my inability to add to the scanty stock of knowledge already in possession of geographers. If my health had permitted, I might have investigated and explored, noted observations, and treasured up facts and circumstances, to place them in the hands of wiser men for their conclusions; but I was not equal to the task. The ruins which I saw were a confused and shapeless mass, and I rode among them without dismounting; there were no columns, no blocks of marble, or large stones which indicated any architectural greatness, and the appearance of the ruins would answer the historical description of a third or fourth-rate city.

About three hours farther on, and half a mile from our path, on the right, was a quadrangular arch with a dome; and near it was a low stone building, also arched, which might have been a small temple. The Bedouins, as usual, referred it to the times of the Christians. For about a mile, in different places on each side of us, were mounds of crumbling ruins; and directly on the caravan-track we came to a little elevation, where were two remarkable wells, of the very best Roman workmanship, about fifty feet deep, lined with large hard stones, as firm and perfect as on the day in which they were laid. The uppermost layer, round the top of the well, which was on a level with the pavement, was of marble, and had many grooves cut in it, apparently worn by the long-continued use of ropes in drawing water. Around each of the wells were circular ranges of columns, which, when the city existed, and the inhabitants came there to drink, might and probably did support a roof similar to those now seen over the fountains in Constantinople. No remains of such roof, however, are existing; and the columns are broken, several of them standing not more than three or four feet high, and the tops scooped out to serve as troughs

for thirsty camels. On the other side, a little in the rear of the wells, is a hill overlooking the scattered ruins below, which may, some hundred years ago, have been the Acropolis of the city. A strong wall seems to have extended around the whole summit level of the hill. I remember that I rode up to the summit, winding around the hill, and leaped my horse over the broken wall; but there was nothing to reward me for the exertion of the undertaking. The enclosure formed by the wall was filled with ruins, but I could give form or feature to none of them; here, too, I rode among them without dismounting; and from here I could see the whole extent of the ruins below. As in the ruined city I had just passed, there was not a solitary inhabitant, and not a living being was to be seen but my companions watering their camels at the ancient wells. This, no doubt, was another of the Roman cities; and although it was probably never celebrated for architectural or monumental beauty, it must have contained a large population.

We were now coming into another country, and leaving the desert behind us; a scanty verdure was beginning to cover the mountains; but the smiling prospect before me was for a moment overclouded by an unfortunate accident. Paul had lent his dromedary to one of the men; and riding carelessly on a baggage camel, in ascending a rough hill the girths of the saddle gave way, and Paul, boxes, and baggage, all came down together, the unlucky dragoon completely buried under the burden. I was the first at his side; and when I raised him up he was senseless. I untied his sash, and tore open his clothes. The Bedouins gathered around, all talking together, pulling and hauling, and one of them drew his sword, and was bending over my prostrate interpreter, with its point but a few inches from his throat. Poor Paul! with his mortal antipathy to cold steel, if he could have opened his eyes at that moment, and seen the fiery orbs of the Bedouins, and the point of a sharp sword apparently just ready to be plunged into his body, he would have uttered one groan and given up the ghost. It was a startling movement to me; and for a moment I thought they were going to employ in his behalf that mercy which is sometimes shown to a dying brute, that of killing him to put him out of misery. I pressed forward to shield him with my own body; and in the confusion of the moment, and my inability to understand what they meant, the selfish feeling came over me of the entire and absolute helplessness of my own condition if Paul should die. But Paul was too good a Catholic to die out of the pale of the church; he could never have rested quietly in his grave, unless he had been laid there amid the wafting of incense and the chanting of priests. "The safety of the patient often consists in the quarrels of the physicians," says Sancho Panza, or some other equally great authority, and perhaps this saved Paul; the Arabs wanted to cut open his clothes and bleed him; but I, not liking the looks of their lancets, would not suffer it; and, between us both, Paul was let alone and came to himself. But it was a trying moment, while I was kneeling on the sand supporting his senseless head upon my knee. No parent could have waited with more anxiety the return to life of an only child, or lover watched the beautiful face of his adored and swooning mistress with more earnestness than I did the ghastly and grisled face of my faithful follower; and when he first opened his eyes, and stared wildly at me, the brightest emanations from the face of beauty could not at that moment have kindled warmer emotions in my heart. I never thought I should look on his ugly face with so much pleasure. I put him on my horse, and took his dromedary; and in half an hour we came to a Bedouin encampment, in one of the most singular and interesting spots I ever saw.

We should have gone on two hours longer, but Paul's accident made it necessary to stop as soon as we found a proper place; and I should have regretted exceedingly to pass by this without a halt. There was something interesting even in our manner of approaching it. Wo

were climbing up the side of a mountain, and we saw on a little point on the very summit the figure of an Arab, with his face towards the tomb of the prophet, kneeling and prostrating himself in evening prayer. He had finished his devotions, and was sitting upon the rock when we approached, and found that he had literally been praying on his house top, for his habitation was in the rock beneath. Like almost every old man one meets in the East, he looked exactly the patriarch of the imagination, and precisely as we would paint Abraham, Isaac, or Jacob. He rose as we approached, and gave us the usual Bedouin invitation to stop and pass the night with him; and, leading us a few paces to the brink of the mountain, he showed us in the valley below the village of his tribe.

The valley began at the foot of the elevation on which we stood, and lay between ranges of broken and overhanging rocks, a smooth and beautiful table of green, for perhaps a quarter of a mile, and beyond that distance broke off and expanded into an extensive meadow. The whole of this valley, down to the meadow, was filled with flocks of sheep and goats; and for the first time since I left the banks of the Nile, I saw a herd of cows. I did not think I should ever be guilty of a sentiment at beholding a cow, but so it was; after my long journey in the desert, my feelings were actually excited to tenderness by the sight of these old acquaintances.

But where were the dwellings of the pastors, the tents in which dwelt the shepherds of these flocks and herds? In Egypt I had seen the Arabs living in tombs, and among the ruins of temples; in the desert I have seen them dwelling in tents; but I had never yet seen them making their habitations in the rude crevices of the rocks. Such, however, were their habitations here. The rocks in many places were overhanging; in others there were chasms or fissures; and wherever there was any thing that could afford a partial protection from the weather on one side, a low, rough, circular wall of stone was built in front of it, and formed the abode of a large family. Within the small enclosure in front, the women were sitting winnowing or grinding grain, or rather pounding and rubbing it between two stones, in the same primitive manner practised of old, in the days of the patriarchs. We descended and pitched our tents in the middle of the valley; and my first business was to make some hot tea for Paul, roll him up in blankets and coverlets, and thus repeat the sweating operation that had done him so much good before. He was badly hurt, and very much frightened. The boxes had fallen upon him, and the butt of a heavy gun, which he held in his left hand, had struck with all the momentum of its fall against his breast. He thought his ribs were all broken; and when I persuaded him that they were as good as ever, he was sure there was some inward bruise, that would be followed by mortification; and until we separated, especially when we had any hard work before us, he continued to complain of his hurts by this unlucky misadventure.

Having disposed of Paul, I strode out to examine more particularly the strange and interesting scene in the midst of which we were. The habitations in the crevices of the rocks, had as they would be considered any where else, I found much more comfortable than most of the huts of the Egyptians on the banks of the Nile, or the rude tents of the Bedouins. It was not sheer poverty that drove these shepherds to take shelter in the rocks, for they were a tribe more than 300 strong, and had flocks and herds such as are seldom seen among the Bedouins; and they were far better clad, and had the appearance of being better fed, than my worthy companions. Indeed, they were a different race from mine; and here, on the borders of the desert, I was again struck with what had so forcibly impressed me in crossing the borders of Ethiopia, the strong and marked difference of races in the East. The Bedouins among whom we were encamped were taller, stouter, and had longer faces than the El Alouins; and sometimes I thought I saw in them strong marks of the Jewish

physiognomy. Above all, they were whiter; and this, with the circumstance of the women being less particular in keeping their faces covered, enabled me to pass an hour before dark with much satisfaction. The change from the swarthy and bearded visages of my travelling companions to the comparatively fair and feminine countenances of these pastoral women, was striking and agreeable, and they looked more like home than any thing I had seen for a long time, except the cows. I cannot help thinking what a delight it would have been to meet, in that distant land, one of those beautiful fairies, lovely in all the bewitching attractions of frocks, shoes, stockings, clean faces, &c., of whom I now meet dozens every day, with the calm indifference of a stoic, since, even in spite of bare feet and dirty faces, my heart warmed towards the women of the desert. I could have taken them all to my arms; but there was one among them who might be accounted beautiful even among the beautiful women of my own distant home. She was tall, and fairer than the most of her tribe; and with the shepherd's crook in her hand, she was driving her flock of goats up the valley to the little enclosure before the door of her rocky dwelling. There was no colour in her cheek, but there was gentleness in her eye, and delicacy in every feature; and, moving among us, she would be cherished and cared for as a tender plant, and served with all respect and love; but here she was a servant; her days were spent in guarding her flock, and at night her tender limbs were stretched upon the rude floor of her rocky dwelling. I thought of her much, and she made a deep impression upon me; but I was prevented from attempting to excite a correspondent feeling in her gentle bosom by the crushed state of Paul's ribs, and my own inability to speak her language.

In the evening the men and women, or, to speak more pastorally, the shepherds and shepherdesses, came up one after another, with their crooks in their hands and their well-trained dogs, driving before them their several flocks. Some entered the little enclosures before their rude habitations; but many, destitute even of this miserable shelter, slept outside in the open valley, with their flocks around them, and their dogs by their side, presenting the same pastoral scenes which I had so often looked upon among the mountains of Greece; but unhappily, here, as there, the shepherds and shepherdesses do not in the least resemble the Chloes and Phillises of poetic dreams. In the evening we seated ourselves round a large bowl of cracked corn and milk, so thick as to be taken with the hands, unaided by a spoon or ladle, followed by a smoking marmite of stewed kid; and after this exercise of hospitality to the strangers, some withdrew to their rocky dwellings, others laid themselves down around the fire, and I retired to my tent. All night I heard from every part of the valley the lowing of cattle, the bleating of lambs and goats, and the loud barking of the watch-dog.

Early in the morning, while the stars were yet in the sky, I was up and out of my tent. The flocks were still quiet, and the shepherds and shepherdesses were still sleeping with the bare earth for their bed, and the canopy of heaven their only covering. One after the other they awoke; and as the day was breaking, they were milking the cows and goats, and at broad daylight they were again moving, with their crooks and dogs, to the pasture-ground at the foot of the valley.

We set off at an early hour, Paul again on my horse, and I on his dromedary; the patriarchal figure who had welcomed being the last to speed me on my way. At every step we were now putting the desert behind us, and advancing into a better country. We had spent our last night in the wilderness, and were now approaching the Holy Land; and no pilgrim ever approached its borders with a more joyous and thankful heart than mine.

At nine o'clock we came to another field of ruins, where the relics of an Arab village were mingled with those of a Roman city. The hands of the different builders and residents were visible among them; two

square buildings of large Roman stone were still standing like towers, while all the rest had fallen to pieces, and the stones which once formed the foundations of palaces were now worked up into fences around holes in the rocks, the burrowing-places of the miserable Arabs.

And here, too, we saw the tokens of man's inhumanity to man; the thunder of war had been levelled against the wretched village, the habitations were in ruins, and the inhabitants whom the sword had spared were driven out and scattered no one knew whither. On the borders of the Holy Land we saw that Ibrahim Pacha, the great Egyptian soldier, whose terrible war-cry had been heard on the plains of Egypt and among the mountains of Greece, in the deserts of Syria and under the walls of Constantinople, was ruling the conquered country with the same rod of iron which his father swayed in Egypt. He had lately been to this frontier village with the brand of war, and burning and desolation had marked his path.

Soon after, we came to an inhabited village, the first since we left Cairo. Like the ruined and deserted village we had left, it was a mingled exhibition of ancient greatness and modern poverty; and probably it was a continuation of the same ruined Roman city. A large fortress, forming part of a battlement, in good preservation, and fragments of a wall, formed the nucleus of a village, around which the inhabitants had built themselves huts. The rude artisans of the present day knew nothing of the works which their predecessors had built; and the only care they had for them was to pull them down, and with the fragments to build for themselves rude hovels and enclosures; and the sculptured stones which once formed the ornaments of Roman palaces, were now worked up into fences around holes in the ground, the poor dwellings of the miserable Arabs.

The stranger from a more favoured land, in looking at the tenants of these wretched habitations, cannot help thanking his God that his lot is not like theirs. When I rode through, the whole population had crawled out of their holes and hiding-places, and were basking in the warmth of a summer's sun; and I could not help seeing the kindly hand of a benefactor in giving to them what he has denied to us, a climate where, for the greater part of the year, they may spend their whole days in the open air, and even at night hardly need the shelter of a roof. This is probably the last of the cities which once stood on the great Roman road from Jerusalem to Akaba. While riding among the ruins, and stopping for a moment to talk with some of the Arabs, I saw on the left, in the side of a mountain, an open door like those of the tombs in Egypt; a simple orifice, without any ornament or sculpture. A woman was coming out with a child in her arms, a palpable indication that here, too, the abodes of the dead were used as habitations by the living. In Paul's disabled state I could ask no questions, and I did not stop to explore.

I cannot leave this interesting region without again expressing my regret at being able to add so little to the stock of useful knowledge. I can only testify to the existence of the ruins of cities which have been known only in the books of historians, and I can bear witness to the desolation that reigns in Edom. I can do more, not with the spirit of scoffing at prophecy, but of one who, in the strong evidence of the fulfilment of predictions uttered by the voice of inspiration, has seen and felt the evidences of the sure foundation of the Christian faith; and having regard to what I have already said in reference to the interpretation of the prophecy, "None shall pass through it for ever and ever," I can say that I have passed through the land of Idumea. My route was not open to the objection made to that of Burckhardt, the traveller who came nearest to passing through the land; for he entered from Damascus, on the east side of the Dead Sea, and struck the borders of Edom at such a point that literally he cannot be said to have passed through it. My route, therefore, is not open to the critical objections made to his; and beyond all peradventure I did pass directly through the land of Idumea lengthwise, and crossing its northern and

southern border; and unless the two Englishmen and Italian before referred to passed on this same route, I am the only person, except the wandering Arabs, who ever did pass through the doomed and forbidden Edom, beholding with his own eyes the fearful fulfilment of the terrible denunciations of an offended God. And though I did pass through and yet was not cut off, God forbid that I should count the prophecy a lie. No; even though I had been a confirmed sceptic, I had seen enough in wandering with the Bible in my hand in that unpeopled desert to tear up the very foundations of unbelief, and scatter its fragments to the winds. In my judgment, the words of the prophet are abundantly fulfilled in the destruction and desolation of the ancient Edom, and the complete and eternal breaking up of a great public highway; and it is neither necessary nor useful to extend the denunciation against a passing traveller.\*

## CHAPTER XXV.

Approach to Hebron.—A Sick Governor.—A Prescription at Random.—Hospitality of the Jews.—Finnale with the Bedouins.—A Storm.—A Calm after the Storm.—Venality of the Arabs.—Hebron.—A Coptic Christian.—Story of the Rabbi.—Professional Employment.

I HAD followed the wandering path of the children of Israel from the land of Egypt and the house of bondage, to the borders of the promised land; had tracked them in their miraculous passage across the Red Sea to the mountains of Sinai, through "the great and terrible wilderness that leadeth to Kadesh Barnea;" and among the stony mountains through which I was now journeying must have been the Kadesh, in the wilderness of Paran, from which Moses sent the ten chosen men to spy out the land of Canaan, who went "unto the brook of Eshcol, and cut down from thence a branch with one cluster of grapes, and bare it between two upon a staff; and though they brought of the pomegranates and figs, and said that surely the land flowed with milk and honey, and these were the fruits thereof, yet brought up such an evil report of the land that it ate up the inhabitants thereof, and of the sons of Anak, the giants that dwell therein, that the hearts of the Israelites sank within them; they murmured against Moses; and for their murmurings they were sent back into the wilderness; and their carcases, from twenty years old and upward, were doomed to fall in the wilderness, and the children of the murmurers to wander forty years before they should enter the land of promise."—Numbers, xiii. 23. I followed in the track of the spies; and though I saw not the Vale of Eshcol with its grapes and pomegranates, neither did I see the sons of Anak, the giants of the land. Indeed, the men of Anak could not have made

\* Keith's celebrated treatise on the Prophecies has passed through fourteen editions, differing in some few particulars. In the sixth edition he says that Sir Frederick Henniker, in his notes dated from Mount Sinai, states that Seetzen, on a vessel of paper pasted against the wall, notifies his having penetrated the country in a direct line between the Dead Sea and Mount Sinai (through Idumea), a route never before accomplished. In a note to the same edition, the learned divine says—"Not even the cases of two individuals, Seetzen and Burckhardt, can be stated as at all opposed to the literal interpretation of the prophecies. Seetzen did indeed pass through Idumea, and Burckhardt traversed a considerable part of it; but the former met his death not long after the completion of his journey through Idumea (he died at Akaba, supposed to have been poisoned); the latter never recovered from the effects of the hardships and privations which he suffered there; and without even commencing the exclusive design which he had in view, namely, to explore the interior of Africa, to which all his journeyings in Asia were merely intended as preparatory, he died at Cairo. Neither of them lived to return to Europe. \* I will cut off from Mount Seir him that passeth out and him that returneth." In the edition which I saw on the Nile, and which first turned my attention to the route through Idumea, I have no recollection of having seen any reference to Seetzen. It may have been there, however, without my particularly noticing it; as, when I read it, I had but little expectation of being able myself to undertake the route.

me turn back from the land of promise. I was so heartily tired of the desert and my Bedouin companions, that I would have thrown myself into the arms of the giants themselves for relief. And though the mountains were as yet stony and barren, they were so green and beautiful by comparison with the desert I had left, that the conviction even of much greater dangers than I had yet encountered could hardly have driven me back. The Bedouins and the Fellahs about Hebron are regarded as the worst, most turbulent, and desperate Arabs under the government of the pacha; but as I met little parties of them coming out towards the frontier, they looked, if such a character can be conceived of Arabs, like quiet, respectable, orderly citizens, when compared with my wild protectors; and they greeted us kindly and cordially as we passed them, and seemed to welcome us once more to the abodes of men.

As we approached Hebron, the sheik became more and more civil and obsequious; and before we came in sight of the city, he seemed to have some misgivings about entering it, and asked me to secure protection from the governor for that night for himself and men, which I did not hesitate to promise. I was glad to be approaching again a place under the established government of the pacha, where, capricious and despotic as was the exercise of power, I was sure of protection against the exactions of my Bedouins; and the reader may judge of the different degrees of security existing in these regions, from being told that I looked to the protection of a Turk as a guarantee against the rapacity of an Arab. After clambering over a rocky mountain, we came down into a valley, bounded on all sides, and apparently shut in by stony mountains. We followed the valley for more than an hour, finding the land good and well cultivated, with abundance of grapes, vines, and olives, as in the day when the spies sent by Moses entered it; and I can only wonder that, to a hardy and warlike people like the Israelites, after a long journey in the desert, the rich products of Hebron did not present more powerful considerations than the cunity of the men of Anak. We turned a point of the mountain to the left; and at the extreme end of the valley, on the side of a hill, bounding it, stands the little city of Hebron, the ancient capital of the kingdom of David. But it bears no traces of the glory of its Jewish king. Thunder and lightning, and earthquakes, wars, pestilence, and famine, have passed over it; and a small town of white houses, compactly built on the side of the mountain, a mosque and two minarets, are all that mark the ancient city of Hebron.

As soon as we came in sight of the city, the sheik dismounted; and arranging his saddle, made Paul take back his dromedary and give me my horse; and placing me on his right hand, and drawing up the caravan with the order and precision of a troop of "regulars," we made a dashing entry. It was on Friday, the Mussulman's Sabbath; and several hundred women, in long white dresses, were sitting among the tombs of the Turkish burying-ground, outside the walls. We passed this burying-ground and a large square fountain connected with the ancient city, being regarded at this day as one of the works of Solomon; and leaving the baggage camels at the gate, with our horses and dromedaries on full gallop, we dashed through the narrow streets up to the door of the citadel, and, in no very modest tone, demanded an audience of the governor. The Turks and Arabs are proverbial for the indifference with which they look upon every thing; and though I knew that a stranger coming from the desert was a rare object, and ought to excite some attention, I was amused and somewhat surprised at the extraordinary sensation our appearance created. Men stopped in the midst of their business; the lazy groups in the cafs sprang up, and workmen threw down their tools to run out and stare at us. I was surprised at this; but I afterwards learned that, since the pacha had disarmed all Syria, and his subjects in that part of his dominions wore arms only by stealth, it was a strange and startling occurrence to see a party of lawless Be-

douins coming in from the desert, armed to the teeth, and riding boldly up to the gates of the citadel.

The janizary at the door told us that the governor was sick and asleep, and could not be disturbed. He was, however, a blundering fellow; and after a few moments' parley, without giving his master any notice, he had us all standing over the sleeping invalid. The noise of our entering and the clang of our weapons roused him; and staring round for a moment, leaning on his elbow, he fixed his eyes on the sheik, and with a voice the like of which can only issue from the bottom of a Turk's throat, thundered out, "Who are you?" The sheik was for a moment confounded, and made no answer. "Who are you?" reiterated the governor, in a voice even louder than before. "I am Ibrahim Pacha's man," said the sheik. "I know that," answered the governor; "none but Ibrahim Pacha's men dare come here; but have you no name?" "Sheik El Alouin," said the Arab, with the pride of a chief of Bedouins, and looking for a moment as if he stood in the desert at the head of his lawless tribe. "I conducted the pacha's caravan to Akaba," and pointing to me, "I have conducted safe through all the bad Arabs Abdel Hasis, the friend of the pacha;" and then the governor, like a wild animal balked in his spring, turned his eyes from the sheik to me, as for the first time sensible of my presence. I showed him my firman, and told him that I did not mean to give him much trouble; that all I wanted was that he would send me on immediately to Bethlehem.

I had no wish to stop at Hebron, though the first city in the Holy Land, and hallowed by high and holy associations. The glory of the house of David had for ever departed. I was anxious to put an outpost between myself and the desert; and I had an indefinable longing to sleep my first night in the Holy Land in the city where our Saviour was born. But the governor positively refused to let me go that afternoon; he said that it was a bad road, and that a Jew had been robbed a few days before on his way to Bethlehem; and again lying down, he silenced all objections with the eternal but hateful word, "Bokhara, bokhara"—"to-morrow, to-morrow." Seeing there was no help for me, I made the best of it, and asked him to furnish me with a place to lodge in that night. He immediately gave orders to the janizary; and as I was rising to leave, asked me if I could not give him some medicine. I had some expectation and some fear of this, and would have avoided it if I could. I had often drugged and physicked a common Arab, but had never been called upon to prescribe for such pure porcelain of the earth as a governor. Nevertheless, I ventured my unskilful hand upon him; and having with all due gravity asked his symptoms, and felt his pulse, and made him stick out his tongue till he could hardly get it back again, I looked down his throat, and into his eyes, and covering him up, told him, with as much solemnity as if I was licensed to kill *secundum artem*, that I would send him some medicine, with the necessary directions for taking it. I was quite equal to the governor's case, for I saw that he had merely half killed himself with eating, and wanted clearing out, and I had with me emetics and cathartics that I well knew were capable of clearing out a whole regiment. In the course of the evening he sent his janizary to me; and, expecting to be off before daylight, I gave him a double emetic, with very precise directions for its use; and I afterwards learned that, during its operation, his wrath had waxed warm against me, but in the morning he was so much better that he was ready to do me any kindness.

This over, I followed the janizary, who conducted me around outside the walls and through the burying-ground, where the women were scattered in groups among the tombs, to a distant and separate quarter of the city. I had no idea where he was taking me; but I had not advanced a horse's length in the narrow streets before their peculiar costume and physiognomies told me that I was among the unhappy remnant of a fallen people, the persecuted and despised Israel-

ites. They were removed from the Turkish quarter, as if the slightest contact with this once-favoured people would contaminate the bigoted follower of the prophet. The governor, in the haughty spirit of a Turk, probably thought that the house of a Jew was a fit place for the repose of a Christian; and following the janizary through a low range of narrow, dark, and filthy lanes, mountings, and turnings, of which it is impossible to give any idea, with the whole Jewish population turning out to review us, and the sheik and all his attendants with their long swords clattering at my heels, I was conducted to the house of the chief Rabbi of Hebron.

If I had had my choice, these were the very persons I would have selected for my first acquaintances in the Holy Land. The descendants of Israel were fit persons to welcome a stranger to the ancient city of their fathers; and if they had been then sitting under the shadow of the throne of David, they could not have given me a warmer reception. It may be that, standing in the same relation to the Turks, alike the victims of persecution and contempt, they forgot the great cause which had torn us apart and made us a separate people, and felt only a sympathy for the object of mutual oppression. But whatever was the cause, I shall never forget the kindness with which, as a stranger and Christian, I was received by the Jews in the capital of their ancient kingdom; and I look to my reception here, and by the monks of Mount Sinai, as among the few bright spots in my long and dreary pilgrimage through the desert.

I had seen enough of the desert, and of the wild spirit of freedom which men talk of without knowing, to make me cling more fondly than ever even to the lowest grade of civilisation; and I could have sat down that night, provided it was under a roof, with the fiercest Mussulman, as in a family circle. Judge, then, of my satisfaction at being welcomed from the desert by the friendly and hospitable Israelites. Returned once more to the occupation of our busy, money-making life, floating again upon the stream of business, and carried away by the cares and anxieties which agitate every portion of our stirring community, it is refreshing to turn to the few brief moments when far other thoughts occupied my mind; and my speculating, scheming friends and fellow-citizens would have smiled to see me that night, with a Syrian dress and long beard, sitting cross-legged on a divan, with the chief rabbi of the Jews at Hebron, and half the synagogue around us, talking of Abraham, Isaac, and Jacob, as of old and mutual friends.

With the few moments of daylight that remained, my Jewish friends conducted me around their miserable quarter. They had few lions to show me, but they took me to their synagogue, in which an old white-bearded Israelite was teaching some prattling children to read the laws of Moses in the language of their fathers; and when the sun was setting in the west, and the Muezzin from the top of the minaret was calling the sons of the faithful to evening prayers, the old rabbi and myself, a Jew and a Christian, were sitting on the roof of the little synagogue, looking out as by stealth upon the sacred mosque containing the hallowed ashes of their patriarch fathers. The Turk guards the door, and the Jew and the Christian are not permitted to enter; and the old rabbi was pointing to the different parts of the mosque, where, as he told me, under tombs adorned with carpets of silk and gold, rested the mortal remains of Abraham, Isaac, and Jacob.

But to return to my Bedouin companions. The sheik and his whole suite had been following close at my heels, through the narrow lanes and streets, up to the very doors of the synagogue; and their swarthy figures, their clattering swords, and grim visages, prevented my seeing the face of many a Hebrew maiden. I expected a scene with them at parting, and I was not disappointed. Returning to the rabbi's, they followed me into the room, and, after a few preliminaries, I counted out the price of the camels, and laid down a bucksheesh for each separately. Not one of them

touched it, but all looked at the money and at me alternately, without speaking a word (it was about ten times as much as I would have had to pay for the same services any where else); and the sheik seemed uncertain what to do. The janizary, however, whose presence I had almost forgotten, put himself forward as an actor in the scene; and half drawing his sword, and rattling it back into its scabbard, swore that it was a vile extortion; that the governor ought to know it; and that the firman of the pacha ought to protect a stranger. This brought the sheik to a decision; and taking up his own portion, and directing the rest to do the same, he expressed himself satisfied, and, without moving from his place, betook himself to smoking. It was evident, however, that he was not altogether content; and the janizary leaving us soon after, hardly had the rattling of his steel scabbard died away along the narrow passage, when they all turned upon me, and gave voice to their dissatisfaction. I told them that I had paid them an enormous price, much more than the sheik had spoken of at Cairo; that I had brought with me more money than he had given me to understand would be necessary, and that it was all gone; that it was impossible to give them any more, for I had it not to give. In fact, I had paid them extravagantly, but far below their extravagant expectations. One would not have come for 200 dollars, another for 100, &c.; and from the noise and clamour which they made here, I am well satisfied that, if the denouement had taken place in the desert, they would have searched for themselves whether there was not something left in the bottom of my trunk; and from what happened afterwards, I am very sure that they would have stripped me of my Turkish plumage; but now I was perfectly safe. I considered a Turkish governor good protection against the rapacity of a Bedouin Arab. I did not even fear their future vengeance, for I knew that they did not dare set their feet outside of any gate in Hebron, except that which opened to their own tents in the desert; they seemed to think that they had let me slip through their fingers; and when they pushed me to desperation, I told them that I did not care whether they were satisfied or not. As I rose, the sheik fell; and when I began working myself into a passion at his exorbitant demand, he fell to begging a dollar or two, in such moving terms that I could not resist. I continued yielding to his petty extortions, until, having ascertained the expense, I found that I had not a dollar more than enough to carry me to Jerusalem; and at this moment he consummated his impudence by begging my dress from off my back. The dress was of no great value; it had not cost much when new, and was travel-worn and frayed with hard usage; but it had a value in my eyes from the mere circumstance of having been worn upon this journey. I had given him nearly all my tent equipage, arms, ammunition, &c., and I had borne with all his twopenny extortions; but he urged and insisted, and begged and entreated, with so much pertinacity, that my patience was exhausted, and I told him that I had borne with him long enough, and that he and his whole tribe might go to the d—l. This was not very courteous or dignified between treaty-making powers; but considering that the immediate subject of negotiation was an old silk dress, and the parties were a single individual and a horde of Bedouins, it may perhaps be allowed to pass. All the nice web of diplomacy was now broken; and all springing at the same moment to our feet, the whole group stood fronting me, glaring upon me like so many wild beasts. Now the long-smothered passion broke out; and wild and clamorous as the Arabs always were, I had never seen them so perfectly furious. They raved like so many bedlamites; and the sheik, with torrents of vociferation and reproach, drew from his bosom the money he had accepted as his portion, dashed it on the floor, and, swearing that no Frank should ever pass through his country again, poured out upon me a volley of bitter curses, and, grinding his teeth with rage and disappointment, rushed out of the room. I did not

then know what he was saying; but I could judge, from the almost diabolical expression of his face, that he was not paying me very handsome compliments; and I felt a convulsive movement about the extreme end of my foot, and had advanced a step to help him down stairs, but his troop followed him close; and I do not know how it is, but when one looks long at the ugly figure of a Bedouin, he is apt to forego a purpose of vengeance. There is something particularly truculent and pacifying in their aspect.

A moment after he had gone, I was exceedingly sorry for what had happened, particularly on account of his oath that no European should ever pass through his country. I felt unhappy in the idea that, when I expected to be the pioneer in opening a new and interesting route, I had become the means of more effectually closing it. With a heavy heart, I told Paul that I must have another interview; that the old dress must go, and any thing else I had; and, in short, that I must have peace upon any terms. To dispose of this business without mixing it with other things: in about an hour the sheik returned with his brother, and, walking up to me and kissing my hand, told me that he had just heard of a robbery on the road to Jerusalem, and came to tell me of it; and looking me in the face, added that, when he had got back to his tent, he felt unhappy at having left me in anger; that he had been so used to sitting with me, that he could not remain away, &c. &c. I was not to be outdone; and looking him back again in the face, I introduced him to my Jewish companions as my dearest friend, the chief of the tribe of El Alouins, who had protected me with his life through the dangers of the desert, and to whose bold arm they were indebted for the privilege they then enjoyed of seeing my face. The sheik looked at me as if he thought me in earnest, and himself entitled to all that I had said; and, satisfied so far, he sat down and smoked his pipe, and at parting disclosed the object of his visit, by asking me for a letter of recommendation to the consul at Cairo, and to the friends of whom I had before spoken as intending to follow me to Petra. Glad to patch up a peace, I told him to come to me early the next morning, and I would settle every thing to his satisfaction. Before I was awake, he was shaking me by the shoulder. I jumped up, and roused Paul; and now wishing to redeem my ungraciousness of the day before, I may say literally that "I parted my raiment among them," and gave away pretty much every thing I had except my European clothes, completing my present with a double-barrelled gun, rather given to bursting, which I gave the sheik's brother. The sheik had changed his tone altogether, and now told me that he loved me as a brother; and, pointing to the brother at his side, that he loved me as well as him; and with great warmth assured me, that if I would turn Mussulman, and come and live with him in his tents in the wilderness, he would give me for wives four of the most beautiful girls of his tribe. He did not confine his offers to me, but told me that he would receive, guard, and protect any of my friends as if they were of his own blood; and warming with his own generosity, or perhaps really feeling a certain degree of kindness, he asked me for some symbol or sign which should be perpetual between us. I had just sealed a letter for Mr Giddon, and a stick of sealing-wax and a lighted lamp were on the low table before me. I made a huge plaster with the sealing-wax on a sheet of coarse brown paper, and, stamping it with the stock of my pistol, chased and carved in the Turkish fashion, I gave him a seal with such a device as would have puzzled the professors of heraldry, telling him that, when any one came to him with this seal, he might know he was a friend of mine; and I added, that I would never send any one without plenty of money; so that any one who visits the Sheik El Alouin with my recommendation, must expect to make up for my deficiencies. This over, we bade each other farewell, the sheik and the whole of his swarthy companions kissing me on both sides of my face. I looked after them as long as they continued in sight,

listened till I heard the last clattering of their armour, and I never saw nor do I ever wish to see them again. I am sorry to entertain such a feeling towards any who have been the companions of my wanderings, and I hardly know another instance, from the English nobleman down to a muleteer or boatman, at parting with whom I have not felt a certain degree of regret. But when I parted with the Bedouin chief, though he kissed me on both cheeks, though he gave me his signet and has mine in return, and though four Arabian girls are ready for me whenever I choose to put my trust in Mohammed and Sheik El Alouin, it was delightful to think that I should never see his face again.

One by one I had seen the many illusions of my waking dreams fade away; the gorgeous pictures of oriental scenes melt into nothing; but I had still clung to the primitive simplicity and purity of the children of the desert, their temperance and abstinence, their contented poverty and contempt for luxuries, as approaching the true nobility of man's nature, and sustaining the poetry of the "land of the East." But my last dream was broken; and I never saw among the wanderers of the desert any traits of character or any habits of life which did not make me prize and value more the privileges of civilisation. I had been more than a month alone with the Bedouins; and to say nothing of their manners, excluding women from all companionship; dipping their fingers up to the knuckles in the same dish; eating sheep's insides, and sleeping under tents crawling with vermin engendered by their filthy habits, their temperance and frugality are from necessity, not from choice; for in their nature they are gluttonous, and will eat at any time till they are gorged of whatever they can get, and then lie down and sleep like brutes. I have sometimes amused myself with trying the variety of their appetites, and I never knew them refuse any thing that could be eaten. Their stomach was literally their god, and the only chance of doing any thing with them was by first making to it a grateful offering; instead of scorning luxuries, they would eat sugar as boys do sugar-candy; and I am very sure, if they could have got poundcake, they would never have eaten their own coarse bread.

One might expect to find these children of Nature free from the reproach of civilised life, the love of gold. But, fellow-citizens and fellow-worshippers of Mammon, hold up your heads; this reproach must not be confined to you. It would have been a pleasing thing to me to find among the Arabs of the desert a slight similarity of taste and pursuits with the denizens of my native city; and in the early developments of a thirst for acquisition, I would have hailed the embryo spirit which might one day lead to stock and exchange boards, and laying out city lots around the base of Mount Sinai or the excavated city of Petra. But the savage was already far beyond the civilised man in his appetite for gold; and though brought up in a school of hungry and thirsty disciples, and knowing many in my native city who regard it as the one thing needful, I blush for myself, for my city, and for them, when I say that I never saw one among them who could be compared with the Bedouin; I never saw anything like the expression of face with which a Bedouin looks upon silver or gold. When he asks for bucksheesh, and receives the glittering metal, his eyes sparkle with wild delight, his fingers clutch it with eager rapacity, and he skulks away like the miser, to count it over alone, and hide it from all other eyes.

Hebron, one of the oldest cities of Canaan, is now a small Arab town, containing seven or eight hundred Arab families. The present inhabitants are the wildest, most lawless, and desperate people in the Holy Land; and it is a singular fact, that they sustain now the same mutinous character with the rebels of ancient days, who armed with David against Saul, and with Absalom against David. In the late desperate revolution against Mohammed Ali, they were foremost in the strife, the first to draw the sword, and the last to return it to its scabbard. A petty Turk now wields the sceptre of the

son of Jesse, and a small remnant of a despised and persecuted people still hover round the graves of their fathers; and though degraded and trampled under foot, from the very dust in which they lie are still looking to the restoration of their temporal kingdom.

Accompanied by my Jewish friends, I visited the few spots which tradition marks as connected with scenes of Bible history. Passing through the bazaars at the extreme end, and descending a few steps, we entered a vault containing a large monument, intended in memory of Abner, the greatest captain of his age, the favoured and for a long time trusted officer of David, who, as the Jews told me, was killed in battle near Hebron, and his body brought here and buried. The great mosque, the walls of which, the Jews say, are built with the ruins of the temple of Solomon, according to the belief of the Mussulmans and the better authority of the Jews, covers the site of the Cave of Machpelah, which Abraham bought from Ephron the Hittite; and within its sacred precincts are the supposed tombs of Abraham, Isaac, and Jacob. The doors were guarded with jealous care by the bigoted Mussulmans; and when, with my Jewish companion, I stopped for a moment to look up at the long marble staircase leading to the tomb of Abraham, a Turk came out from the bazaars, and, with furious gesticulations, gathered a crowd around us; and a Jew and a Christian were driven with contempt from the sepulchre of the patriarch whom they both revered. A special firman from the pacha, or perhaps a large bribe to the governor, might have procured me a private admission; but death or the Koran would have been the penalty required by the bigoted people of Hebron.

On a rising ground a little beyond the mosque, is a large fountain or reservoir, supported by marble pillars, where my companions told me that Sarah had washed the clothes of Abraham and Isaac. Leaving this, I went once more to the two pools outside the walls, and after examining them as the so-called works of Solomon, I had seen all a stranger could see in Hebron.

I cannot leave this place, however, without a word or two more. I had spent a long evening with my Jewish friends. The old rabbi talked to me of their prospects and condition, and told me how he had left his country in Europe many years before, and come with his wife and children to lay their bones in the Holy Land. He was now eighty years old; and for thirty years, he said, he had lived with the sword suspended over his head—had been reviled, buffeted, and spit upon; and though sometimes enjoying a respite from persecution, he never knew at what moment the bloodhounds might not be let loose upon him; that, since the country had been wrested from the sultan by the Pacha of Egypt, they had been comparatively safe and tranquil; though some idea may be formed of this comparative security from the fact, that during the revolution two years before, when Ibrahim Pacha, after having been pent up several months in Jerusalem, burst out like a roaring lion, the first place upon which his wrath descended was the unhappy Hebron; and while their guilty brethren were sometimes spared, the unhappy Jews, never offending but always suffering, received the full weight of Arab vengeance. Their houses were ransacked and plundered; their gold and silver, and all things valuable, carried away; and their wives and daughters violated before their eyes by a brutal soldiery.

During the evening a fine portly man, in the flowing Syrian dress, came to pay me a visit. His complexion proclaimed him of Coptic origin, a descendant of the ancient lords of Egypt; his inkhorn in his sash told me that he was a writer, and his cordial salutation that he was a Christian. Living among Turks, Arabs, and Jews, he greeted me as if it were a rare thing to meet a professor of the same faith, and a believer in the same God and Saviour. He regretted that he had been away when I arrived, and said that he ought by right to have had me at his house, as he was the only Christian in Hebron; and he, even where proselytes were wanted,

would perhaps not have passed muster according to the strict canons of a Catholic church. My Christian friend, however, was more of a Jew than any of the descendants of Israel around me; for amid professions of friendship and offers of service, he was not forgetting his own interests. The European and American governments had been appointing consular agents in many of the cities of Syria, and this office, under the government of the present pacha, exempted the holder from certain taxes and impositions, to which the fellahs and rayahs were subject. America is known in the Holy Land by her missionaries, by the great ship (the *Dawar*) which a year before touched at the seaport towns, and by the respect and character which she confers on her consular agents. My Coptic Christian knew her on the last account, and told me, in confidence, that he thought America had need of a consular agent in Hebron, to protect her citizens travelling in that region. I was the first American traveller who had ever been there, and years may roll by before another follows me; but I fully concurred with him in the necessity of such an officer: and when he suggested that there was no better man than himself to hold it, I concurred with him again. Little did I think when, years before, I was seeking to climb the slippery rungs of the political ladder, that my political influence would ever be sought for the office of consul in the ancient capital of David; but so it was; and without questioning him too closely about his faith in the principles and usages of the democratic party, the virtue of regular nominations, &c., taking his name written in Arabic, and giving him my card that he might know the name of his political benefactor, I promised to speak to the consul at Beyroot in his favour; and he left me with as much confidence as if he had his commission already in his pocket.

A more interesting business followed with the old rabbi, probably induced by what had just passed between the Christian and myself. He told me that he had lately had occasion to regret exceedingly the loss of a paper, which would now be of great use to him; that he was a Jew of Venice (I can vouch for it that he was no Shylock), and thirty years before had left his native city and come to Hebron with a regular passport; that for many years a European passport was no protection, and, indeed, it had been rather an object with him to lay aside the European character, and identify himself with the Asiatics; that, in consequence, he had been careless of his passport, and had lost it; but that now, since the conquest of Mohammed Ali and the government of Ibrahim Pacha, a European passport was respected, and saved its holder and his family from Turkish impositions. He mourned bitterly over his loss, not, as he said, for himself, for his days were almost ended, and the storms of life could not break over his head more heavily than they had already done; but he mourned for his children and grandchildren, whom his carelessness had deprived of the evidence of his birthright and the protection of their country. I was interested in the old man's story, and particularly in his unobtrusive manner of telling it; and drawing upon the reminiscences of my legal knowledge, I told him that the loss of his passport had not deprived him of his right to the protection of his country, and that, if he could establish the fact of his being a native of Venice, he might still sit down under the wings of the double-headed eagle of Austria. I afterwards went more into detail. Learning that there were in Hebron some of his very old acquaintances who could testify to the fact of his nativity, I told him to bring them to me, and I would take their affidavits, and, on my arrival at Beyroot, would represent the matter to the Austrian consul there; and I thought that with such evidence the consul would not refuse him another passport. He thanked me very warmly, and the next morning early, while I was waiting, all ready for my departure, he brought in his witnesses. It would have been difficult for the old man to produce deponents who could swear positively to his nativity; but of those whom he brought any one could

look back farther than it is usually allowed to man. They were all over sixty, and their long white beards gave them a venerable appearance, which made me attach more importance to the proceedings than I intended. These hoary-headed men, I thought, could not speak with lying lips; and taking my place in the middle of the floor, the witnesses seated themselves before me, and I prepared, with business-like formality, to examine them, and reduce their examination to writing. Since I left home I had rarely thought of any thing connected with my professional pursuits, and I could not but smile as I found myself seated in the middle of a floor, surrounded by a crowd of Israelites in the old city of Hebron, for the first time in more than eighteen months resuming the path of my daily walks at home. I placed the scribe before me, and with a little of the keenness of the hunter returning to a track for some time lost, I examined the witnesses severally, and dictated in good set form the several requisite affidavits; and then reading them over distinctly, like a commissioner authorised to take acknowledgments under the act, &c., I swore the white-bearded old men upon the table of their law, a Hebrew copy of the Old Testament. I then dictated an affidavit for the rabbi himself, and was about administering the oath as before, when the old man rose, and taking the paper in his hand, and telling me to follow him, led the way through a range of narrow lanes and streets, and a crowd of people, to the little synagogue, where, opening the holy of holies, and laying his hand upon the sacred scroll, he read over the affidavit and solemnly swore to its truth. It did not need this additional act of solemnity to convince me of his truth; and when he gave me back the paper, and I saw the earnestness and deep interest depicted in the faces of the crowd that had followed us, I again resolved that I would use my best exertions to gladden once more the old man's heart before he died. I added to the several affidavits a brief statement of the circumstances under which they had been taken, and putting the paper in my pocket, returned to the house of the rabbi; and I may as well mention here, that at Beyroot I called upon the Austrian consul, and before I left had the satisfaction of receiving from him the assurance that the passport should be made out forthwith, and delivered to the agent whom the old rabbi had named to me.

I had nothing now to detain me in Hebron; my mules and a kervash provided by the governor were waiting for me, and I bade farewell to my Jewish friends. I could not offer to pay the old rabbi with money for his hospitality, and would have satisfied my conscience by a compliment to the servants; but the son of the good old man, himself more than sixty, told Paul that they would all feel hurt if I urged it. I did not urge it; and the thought passed rapidly through my mind, that while yesterday the children of the desert would have stripped me of my last farthing, to-day a Jew would not take from me a para. I passed through the dark and narrow lanes of the Jewish quarter, the inhabitants being all arranged before their houses; and all along, even from the lips of maidens, a farewell salutation fell upon my ears. They did not know what I had done, or what I proposed to do; but they knew that I intended a kindness to a father of their tribe, and they thanked me as if that kindness were already done. With the last of their kind greetings still lingering on my ears, I emerged from the Jewish quarter; and it was with a warm feeling of thankfulness I felt, that if yesterday I had had an Arab's curse, to-day I had a Jewish blessing.

#### CHAPTER XXVI.

An Arnaout.—The Pools of Solomon.—Bethlehem.—The Empress Helena.—A Clerical Exquisite.—Miraculous Localities.—A Boon Companion.—The Soldier's Sleep.—The Birthplace of Christ.—Worship in the Grotto.—Moslem Fidelity.

I HAD given away all my superfluous baggage, and commenced my journey in the Holy Land with three mules,

one for myself, another for Paul, and the third for my baggage. The muleteer, who was an uncommonly thriving-looking, well-dressed man, rode upon a donkey, and had an assistant, who accompanied on foot; but by far the most important person of our party was our kervash. He was a wild Arnaout, of a race that had for centuries furnished the bravest, fiercest, and most terrible soldiers in the army of the sultan; and he himself was one of the wildest of that wild tribe. He was now about forty, and had been a warrior from his youth upward, and battles and bloodshed were familiar to him as his food; he had fought under Ibrahim Pacha in his bloody campaign in Greece, and his rebellious war against the sultan; and having been wounded in the great battle in which the Egyptian soldiers defeated the grand vizier with the flower of the sultan's army, he had been removed from the regular service, and placed in an honourable position near the governor of Hebron. He was above the middle height, armed like the bristling porcupine, with pistols, a Damascus sabre, and a Turkish gun slung over his back, all which he carried as lightly and easily as a sportsman does his fowling-piece. His face was red, a burnt or baked red; his mustaches seemed to curl spontaneously, as if in contempt of dangers; and he rode his high-mettled horse as if he were himself a part of the noble animal. Altogether, he was the boldest, most dashing, and martial-looking figure I ever saw; and had a frankness and openness in his countenance which, after the dark and sinister looks of my Bedouins, made me take to him the moment I saw him. I do not think I made as favourable an impression upon him at first; for almost the first words he spoke to Paul after starting were to express his astonishment at my not drinking wine. The janizary must have told him this as he sat by me at supper, though I did not think he was watching me so closely. I soon succeeded, however, in establishing myself on a good footing with my kervash, and learned that his reading of the Koran did not forbid the wine-cup to the followers of the prophet. He admitted that the sultan, as being of the blood of the prophet, and the vicegerent of God upon earth, ought not to taste it; but as to the Pacha of Egypt, he drank good wine whenever he could get it, and this gave his subjects a right to drink as often as they pleased.

We were interrupted by an Arab, who told us that a party of soldiers had just caught two robbers. The kervash pricked up his ears at this, and telling us that he would meet us at a place some distance farther on, he drove his heavy stirrups into his horse's sides, and, dashing up the hill at full gallop, was out of sight in an instant. I did not think it exactly the thing to leave us the first moment we heard of robbers; but I saw that his fiery impatience to be present at a scene could not be controlled; and I felt well assured, that if danger should arrive, we would soon find him at our side. Soon after we found him waiting with the party he had sought; the two robbers chained together, and, probably, long before this, they have expiated their crime with their lives. He told us that from Hebron to Jerusalem was the most unsafe road in the Holy Land; and that Ibrahim Pacha, who hated the Arabs in that vicinity, was determined to clear it of rebels and robbers, if he cut off every man in the country.

About half an hour from Hebron we came to a valley, supposed to be the Vale of Esheol, where the spies sent out by Moses found the grapes so heavy, that to carry one bunch it was necessary to suspend it on a pole. On the right we passed a ruined wall, by some called the Cave of Machpelah, or sepulchre of the patriarchs, but which the Jews at Hebron had called the House of Abraham.

We were on our way to Bethlehem. I had hired my mules for Jerusalem, expecting merely to stop at Bethlehem and push on to Jerusalem that night. The road between these oldest cities was simply a mule-path over rocky mountains, descending occasionally into rich valleys. We had already, on this our first journey in the Holy Land, found that the character given of it in

the Bible is true at this day; and that the Land of Promise is not like the land of Egypt, watered by the dews of heaven, but by copious and abundant rains. Indeed, the rain was falling in torrents; our clothes were already dripping wet, but we did not mind it, for we were too full of thankfulness that continued sunshine and clear and unclouded skies had been our portion, when we most needed them, in the desert.

The heavy fall of rain made the track slippery and precarious; and it was four hours before we reached the celebrated reservoirs, known to modern travellers under the name of the Pools of Solomon. These large, strong, noble structures, in a land where every work of art has been hurried to destruction, remain now almost as perfect as when they were built. There are three of them, about 480, 600, and 660 feet in length, and 280 in breadth, and of different altitudes, the water from the first running into the second, and from the second into the third. At about a hundred yards' distance is the spring which supplies the reservoirs, as the monks say, the sealed fountain referred to in Canticles, iv. 12. The water from these reservoirs is conveyed to Jerusalem by a small aqueduct, a round earthen pipe about ten inches in diameter, which follows all the sinuosities of the ground, being sometimes above the surface, and sometimes under. It is easily broken; and while I was in Jerusalem, an accident happened which entirely cut off the water from the pools.

There is every reason to believe that these pools have existed from the date assigned to them; and that this was the site of one of King Solomon's houses of pleasure, where he made himself "gardens, and orchards, and pools of water." The rain here ceased for a few moments, and enabled me to view them at my leisure; and as I walked along the bank, or stood on the margin, or descended the steps to the water's edge, it seemed almost the wild suggestion of a dream, to imagine that the wisest of men had looked into the same pool, had strolled along the same bank, and stood on the very same steps. It was like annihilating all the intervals of time and space. Solomon and all his glory are departed, and little could even his wisdom have foreseen, that long after he should be laid in the dust, and his kingdom had passed into the hands of strangers, a traveller from a land he never dreamed of would be looking upon his works, and murmuring to himself the words of the preacher, "Vanity of vanities, all is vanity."

A little to the right of the pools, towards the region of the Dead Sea, is a very large grotto, supported by great pillars of the natural rock, perfectly dry, without petrification or stalactites; it is a perfect labyrinth within, and, as in many of the ancient catacombs, a man might easily lose himself for ever in its windings. It lies in the mountainous wilderness of Engaddi, and is supposed to be the Cave of Adullam, where David received the mutinous and discontented spirits of his days, and where, when Saul was in pursuit of him, he cut off the skirts of his garment, and suffered him to go away unharmed.

In an hour more we came in sight of Bethlehem, seated on an elevation, a confused and irregular pile of white buildings. The star of the east no longer hovers over it to mark the spot where the Saviour was born; and the mosque and the minaret proclaim the birthplace of Christ under the dominion of a people who reject and despise him.

Heaps of ruins and houses blackened with smoke show that the hand of war has been there. Ibrahim Pacha, on his sortie from Jerusalem, and on his way to Hebron, had lingered on his path of destruction long enough to lay in ruins half the little city of Bethlehem. It is a singular fact, and exhibits a liberality elsewhere unknown in the history of the Turks or the Mussulman religion, that the height of his indignation fell upon the Arabs. He spared the Christians for a reason that never before operated with a Turk—because they had not offended. He did, too, another liberal thing; saying that Christians and Mussulmans could not live together in unity, he drove out from Bethlehem the Arabs whom

the sword had spared, and left the place consecrated by the birth of Christ in the exclusive possession of his followers. True, he stained this act of clemency or policy by arbitrarily taking away thirty Christian boys, whom he sent to work at the factories in Cairo; and the simple-hearted parents, hearing that I had come from that city, asked me if I had seen their children.

It is a happy thing for the traveller in the Holy Land, that in almost all the principal places there is a Christian convent, whose doors are always open to him; and one of the largest and finest of these is in Bethlehem. Riding through the whole extent of the little town, greeted by Christians, who, however, with their white turbans and fierce mustaches and beards, had in my eyes a most unchristian appearance, and stopping for a moment on the high plain in front, overlooking the valley, and the sides of the hill all cultivated in terraces, we dismounted at the door of the convent.

Beginning my tour in the Holy Land at the birthplace of our Saviour, and about to follow him in his wanderings through Judea, Samaria, and Galilee, over the ground consecrated by his preaching, his sufferings, and miracles, to his crucifixion on Calvary, I must prepare my readers for a disappointment which I experienced myself. The immediate followers of our Saviour, who personally knew the localities which are now guarded and revered as holy places, engrossed by the more important business of their Master's mission, never marked these places for the knowledge of their descendants. Neglected for several centuries, many of them were probably entirely unknown, when a new spirit arose in the East, and the minds of the Christians were inflamed with a passion for collecting holy relics, and for making pilgrimages to the places consecrated by the acts and sufferings of our Redeemer and his disciples; and the Empress Helena, the mother of Constantine, the first Christian empress, came as a crusader into the Holy Land, to search for and determine the then unknown localities. And the traveller is often astonished that with so little to guide her, she was so successful; for she not only found all the holy places mentioned in the Bible, but many more; and the piety of Christians will never forget that it was through her indefatigable exertions the true cross was drawn from the bottom of a dark pit, and is now scattered in pieces all over the world, to gladden the hearts of believers. It may be that the earnest piety of the empress sometimes deceived her; but then she always covered a doubtful place with a handsomer monument, upon much the same principle that a jockey praises a bad horse and says nothing of a good one, because the bad one wants praising and the good one can speak for himself. Besides, the worthy empress seemed to think that a little marble could not hurt a holy place, and a good deal might help to make holy what was not so without it; and so think most of the Christian pilgrims, for I have observed that they always kiss with more devotion the polished marble than the rude stone.

But the Christian who goes animated by the fresh, I may almost say virgin feeling, awakened by the perusal of his Bible, expecting to see in Bethlehem the stable in which our Saviour was born, and the manger in which he was cradled, or in Jerusalem the tomb hewn out of the rock wherein his crucified body was buried, will feel another added to the many grievous disappointments of a traveller, when he finds these hallowed objects, or at least what are pointed out as these, covered and enclosed with party-coloured marble, and bedecked with gaudy and inappropriate ornaments, as if intentionally and impiously to destroy all resemblance to the descriptions given in the sacred book.

I had intended going on to Jerusalem that afternoon; but the rain had retarded me so much, that as soon as I saw the interior of the convent, I determined to remain all night. My muleteer insisted upon proceeding, as I had arranged with him when I engaged him; but my kerwash silenced him by a rap over the back with the flat of his sword, and he went off on his donkey alone, leaving behind him his companion and his mules.

Entering by the small door of the convent, I heard in the distance the loud pealing of an organ and the solemn chant of the monks; the sound transported me at once to scenes that were familiar and almost home-like, the churches and cathedrals in Italy; and the appearance of one of the brothers, in the long brown habit of the Capuchins, with his shaved head and sandals on his feet, made me feel for the moment as if I were in Europe. The monks were then at prayers; and following him through the great church, down a marble staircase, and along a subterranean corridor, in five minutes after my arrival in Bethlehem I was standing on the spot where the Saviour of mankind was born.

The superior was a young man, not more than thirty, with a face and figure of uncommon beauty; though not unhealthy, his face was thin and pale, and his high, projecting forehead indicated more than talent. Genius flashed from his eyes, though, so far as I could judge from his conversation, he did not sustain the character his features and expression promised. He was not insensible to the advantages of his personal appearance. The rope around his waist, with the cross dangling at the end, was laid as neatly as a soldier's sword-belt; the top of his head was shaved, his beard combed, and the folds of his long coarse dress, his cowl, and the sandals on his feet, all were arranged with a precision that, under other circumstances, would have made him a Brummel. There was something, too, in the display of a small hand and long taper fingers that savoured more of the exquisite than of the reclusive; but I ought not to have noted him too critically, for he was young, handsome, and gentlemanly, and fit for better things than the dronish life of a convent. I am inclined to believe, too, that he sometimes thought of other things than his breviary and his missal; at all events, he was not particularly familiar with Bible history; for in answer to his question as to the route by which I had come, I told him that I had passed through the land of Idumea; and when I expected to see him open his eyes with wonder, I found that he did not know where the land of Idumea was. I remember that he got down a huge volume in Latin, written by saint Somebody, and we pored over it together until our attention was drawn off by something else, and we forgot what we were looking for.

The walls of the convent contain all that is most interesting in Bethlehem; but outside the walls also are places consecrated in Bible history, and which the pilgrim to Bethlehem, in spite of doubts and confusion, will look upon with exceeding interest. Standing on the high table of ground in front of the convent, one of the monks pointed out the fountain where, when David was thirsting, his young men procured him water; and in the rear of the convent is a beautiful valley, having in the midst of it a ruined village, marking the place where the shepherds were watching their flocks at night when the angel came down and announced to them the birth of the Saviour. The scene was as pastoral as it had been 1800 years before; the sun was going down, the shepherds were gathering their flocks together, and one could almost imagine that, with the approach of evening, they were preparing to receive another visitor from on high. In the distance beyond the valley is a long range of mountains enclosing the Dead Sea, and among them was the wilderness of Engaddi; and the monk pointed out a small opening as leading to the shores of the sea, at the precise spot where Lot's wife was turned into a pillar of salt.

Mixed with these references to Bible history were idle legends of later days, connected with places to which the monk conducted me with as much solemnity as he had displayed when indicating the holy places of Scripture. In a grotto cut out of the rock is a chapel dedicated to the Virgin; and he told me that the mother of Christ had here concealed herself from Herod, and nursed the infant Jesus forty days, before she escaped into Egypt. Near this is another grotto, in which the Virgin, going to visit a neighbour with the child in her

arms, took refuge from a shower, and her milk overflowed; and now, said the monk, there is a faith among all people, Turks, Greeks, and Armenians, that if a woman to whom Nature has denied the power of nursing her child, comes to this grotto and prays before the altar, the fountain of life will be opened to her. Nor was the virtue of the place confined to those who should resort to it in person; for the monks had prayed for and had obtained a delegation of the Virgin's power, and a small portion of powder from the porous rock, swallowed in a little water, would be equally efficacious to women having faith. A huge chamber had been cut away in the back of the grotto by pilgrims, who had taken with them to their distant homes some of this beautiful provision for a want of nature, and Paul and myself each took a pilgrim's share.

It was dark when I returned to the convent, followed by my wild Arnaout, whom, by the way, I have neglected for some time. I had told him on my arrival that I should not need his escort any farther; but he swore that he had his orders, and would not leave me until he saw me safe within the walls of Jerusalem; and so far he had been as good as his word; for, wherever I went, he was close at my heels, following with invincible gravity, but never intruding, and the continual rattling of his steel scabbard being the only intimation I had of his presence. He was now following me through the stone court of the convent, into the room fitted up for the reception of pilgrims and travellers. I liked him, and I liked to hear the clanking of his sword at my heels; I would have staked my life upon his faith; and such confidence did he inspire by his bold, frank bearing, his manly, muscular figure, and his excellent weapons, that with a dozen such I would not have feared a whole tribe of Bedouins. In another country and a former age he would have been the *beau idéal* of a dashing cavalier, and an unfinching companion at the winecup or in the battle-field. I bore in mind our conversation in the morning about wine, and was determined that my liberal expounder of the Koran should not suffer from my abstinence. The superior, apologising for the want of animal food, had told me to call for any thing in the convent, and I used the privilege for the benefit of my thirsty Mussulman. The first thing I called for was wine; and while supper was preparing, we were tasting its quality. He was no stickler for trifles, and accepted, without any difficulty, my apology for not being able to pledge him in full bumpers; and although most of this time Paul was away, and we could not exchange a word, the more he drank the better I liked him. It was so long since I had had with me a companion I liked, that I "cottoned" to him more and more, and resolved to make the most of him. I had a plate for him at table by the side of me; and when Paul, who did not altogether enter into my feelings, asked him if he would not rather eat alone, on the floor, he half drew his sword, and driving it back into its scabbard, swore that he would eat with me if it was on the top of a minaret. We sat down to table, and I did the honours with an unsparring hand. He attempted for a moment the use of the knife and fork, but threw them down in disgust, and trusted to the means with which nature had provided him. The wine he knew how to manage, and for the rest he trusted to me; and I gave him bread, olives, fish, milk, honey, sugar, figs, grapes, dates, &c. &c., about as fast as I could hand them over, one after the other, all together, pell-mell, and with such an utter contempt of all rules of science as would have made a Frenchman go mad. Paul by this time entered into the spirit of the thing; and when my bold guest held up for a moment, he stood by with a raw egg, the shell broken, and turning back his head, poured it down his throat. I followed with a plate of brown sugar, into which he thrust his hand to the knuckles, sent down a huge mouthful to sweeten the egg, and, nearly kicking over the table with an ejaculation about equivalent to our emphatic "enough," threw himself upon the divan. I wound him up with coffee and pipes; and when the superior

came to me in the evening, to the scandal of the holy brotherhood, my wild companion was lying asleep, as drunk as a lord, upon the divan.

Several of the monks came in to see me, and all loved to talk of the world they had left. They were all Italians; and in the dreariness and desolation of Judea, in spite of monastic vows, their hearts turned to the sunny skies of their beautiful native land. They left me at an early hour; and I trust the reader will forgive me, if, in the holy city of Bethlehem, I forgot for a moment the high and holy associations connected with the place, in the sense of enjoyment awakened by the extraordinary luxury of a pair of sheets, a luxury I had not known since my last night in Cairo.

Tempted as I was to yield myself at once to the enjoyment, I paused a while to look at the sleeping figure of my kervash. He lay extended at full length on his back, with his arms folded across his breast, his right hand clutching the hilt of his sword, and his left the handle of a pistol; his broad chest rose and fell with his long and heavy respirations; and he slept like a man who expected to be roused by a cry to battle. His youth and manhood had been spent in scenes of violence; his hands were red with blood; murder and rapine had been familiar to him; and when his blood was up in battle, the shrieks and groans of the dying were music in his ears; yet he slept, and his sleep was calm and sound as that of childhood. I stood over him with the candle in my hand, and flashed the light across his face; his rugged features contracted, and his sword rattled in his convulsive grasp. I blew out the light, and jumped into bed. Once during the night I was awakened by his noise; by the dim light of a small lamp that hung from the ceiling, I saw him stumble to the table, seize a huge jar of water, and apply it to his lips; I saw him throw back his head, and heard his long, regular, and continued swallows; and when he had finished the jar, he drew a long breath, went to the window, came to my bedside, looked at me for a moment, probably thinking what a deal of useless trouble I took in pulling off my clothes; and, throwing himself upon the divan, in a few moments he was again asleep.

In the morning, immediately after breakfast, one of the monks came to conduct me through the convent. The building covered a great extent of ground; and for strength and solidity, as well as size, resembled a fortress. It was built by the Empress Helena, over the spot consecrated as the birthplace of our Saviour, and was intended, so far as human handiwork could do so, to honour and reverence the holy spot. The insufficient means of the pious empress, however, or some other cause, prevented its being finished according to the plan she had designed; and the charity of subsequent Christians has barely sufficed to keep it from falling to ruin. The great church would have been a magnificent building if finished according to her plan; but now, in its incomplete state, it is a melancholy monument of defeated ambition. On each side is a range of noble columns, supporting a frieze of wood, which the monk told me was cedar from Lebanon, and still remaining almost as sound as the solid stone. The whole building is divided among the Catholics, Greeks, and Armenians, the three great bodies who represent, or rather misrepresent, Christianity in the East. Each has its limits, beyond which the others must not pass; and again there are certain parts which are common to all. The Turkish government exercises a control over it; and taking advantage of the dissensions between these different professors, sells the privileges to the highest bidder. In the great church the Greeks, happening to have been the richest, are the largest proprietors, to the great scandal of the Catholics, who hate the Greeks with a most orthodox virulence.

The Grotto of the Nativity is under the floor of the church; the Greeks having an entrance directly by its side, and the Catholics by a longer and more distant passage. I descended by the latter. My Arnaut was close at my heels, grave and sober as if he had never known the taste of wine, and following with a respect that

might have satisfied the most bigoted Christian. Indeed, it was a thing to be noted, with what respect and reverence this wild and lawless Mussulman regarded the holy places, consecrated by a religion he believed false, and the worship of a people he despised. Nevertheless, Paul was scandalised at the eyes of an unbeliever being permitted to see the holy places, and stopped at the top of the staircase, to urge upon me the propriety of making him stay behind. The kervash seemed to understand what he was saying, and to intimate by his looks that it would not be an easy matter to turn him back. I did not think, however, that the feet of a Mussulman would be in themselves a profanation, and the monk making no objection, I silenced Paul's.

Passing through the chapel of the Catholic convent, where the monks were teaching the children of the Arab Christians the principles of the Catholic faith, I was conducted to the room of the superior, where, among other relics which I now forget, he showed me the withered hand of an infant, preserved among the treasures of the convent as having belonged to one of the innocents massacred by the order of Herod. Near the door of the chapel we descended a flight of stone steps, and then a second, until we came to an excavation in the solid rock; and following a passage to the right, came to a little chapel, with an altar, dedicated to Joseph the husband of Mary. At the end of this passage was a large chamber, called the school of St Jerome, where that great Catholic saint wrote his version of the Bible, the celebrated Vulgate. Passing out through the door of this chamber, on the right is the tomb of the saint; and directly opposite are the tombs of Santa Paula, and another whose name I have forgotten—very good ladies, no doubt; but who they were, or why they were buried in that holy place, I did not understand; although they must have died in the odour of sanctity, as their bodies have since been removed to the papal city. Returning into the first passage, and advancing a few steps, on the left is an altar over the pit into which the bodies of the murdered innocents were thrown. Under the altar is a recess with an iron grating, opening into the pit, or rather vault below. By the light of a torch I gazed long and earnestly within, but could see nothing that gave confirmation to the story. Over the altar was a rude painting, representing the massacred infants held up by their heels, with their throats cut, and their bowels gushing out; the anguish of the mothers, and all the necessary and fearful accompaniments of such a scene. A few paces farther is an altar, over the spot where Joseph sat during the birth of the divine infant, meditating upon the great event; and farther on, to the left, is the entrance to the Grotto of the Nativity.

It was the hour assigned for the use of the Armenians, and the monks were all there chanting the praises of the Redeemer. The chamber of the grotto is thirty-seven feet long and eleven wide, with a marble floor and walls, the latter adorned with tapestry and paintings. Directly in front of the door by which we entered, at the other end of the Grotto, is a semicircular recess, lined and floored with small blocks of marble; and in the centre a single star, with the inscription, "Hic natus est Jesus Christus de Virga"—here Christ was born of the Virgin. The star in the east which went before the wise men, says the tradition, rested over this spot; and fourteen lamps, the gifts of Christian princes, burning night and day, constantly illumine the birth-place of salvation to a ruined world. On the right, descending two steps, is a chamber paved and lined with marble, having at one end a block polished and hollowed out; and this is the manger in which our Saviour was laid. Over the altar is a picture representing a stable with horses and cattle, and behind a little iron wickerwork are five lamps constantly burning. Directly opposite is the altar of the magi, where the three kings sat when they came to offer presents to the Son of God. Over it is a picture representing them in the act of making their offerings; and one of the kings is represented as an Ethiopian.

All this has but little conformity with the rude scene

of the stable and the manger as described in the Bible; and in all probability, most of the holy places pointed out in Bethlehem, and adorned and transformed by the false but well-meaning piety of Christians, have no better claim to authenticity than the credulity of a weak and pious old woman. But amid all the doubts that present themselves when we stop to ponder and reflect, it is sufficient for our enjoyment of these scenes to know that we are in "Bethlehem of Judea," consecrated by the greatest event in the history of the world, the birth of the Son of God. We know that, within the atmosphere we breathe, Christ first appeared on earth; that one of the stars of heaven left its place among the constellations, and hovered over the spot on which we stand; that the kings of the earth came here to offer gifts to the holy child; and beholding multitudes of pilgrims from far-distant lands constantly prostrating themselves before the altar, in the earnestness and sincerity of undoubting faith, we give ourselves up to the illusion, if illusion it be, and are ready to believe that we are indeed standing where Christ was born.

My Arnaout behaved remarkably well, though once he broke the stillness of the grotto by an involuntary exclamation; his loud harsh voice, and the rattling of his armour, startled for a moment the monks and praying pilgrims. On coming out, I told him that the Christians were much more liberal than the Mussulmans; for we had permitted him to see all the holy places in the church, while I had been violently driven from the door of the mosque in Hebron. He railed at the ignorance and prejudices of his countrymen, and swore, if I would go back to Hebron, he would carry me through the mosque on the point of his sword. I did not much relish this method of entering a mosque, but took it, as it was meant, for a warm expression of his willingness to serve me; and we returned to the apartment of the superior to bid him farewell. The superior accompanied us to the door of the convent; and, without meaning to be scandalous, or insinuate that there was any thing wrong in it, although he was a young and handsome man, I left him talking with a woman.

## CHAPTER XXVII.

The Tomb of Rachel.—First View of Jerusalem.—Falling among Thieves.—Potent Sway of the Pacha.—A Turkish Dignitary.—A Missionary.—Easter in Jerusalem.—A Little Congregation.

GIVING a last look to the Valley of the Shepherds, we were soon on the mountain's side; and very soon all the interest with which I had regarded Bethlehem was lost, in the more absorbing feeling with which I looked forward to Jerusalem. My muleteer had gone on the night before; my Arnaout knew nothing of the holy places on the road, and we took with us a Christian boy to point them out. The first was the tomb of Rachel, a large building, with a whitened dome, and having within it a high oblong monument, built of brick, and stuccoed over. I dismounted and walked round the tomb, inside and out, and again resumed my journey. All that we know in regard to this tomb is, that Rachel died when journeying with Jacob from Sychem to Hebron, and that Jacob buried her near Bethlehem; and whether it be her tomb or not, I could not but remark that, while youth and beauty have faded away, and the queens of the East have died and been forgotten, and Zenobia and Cleopatra sleep in unknown graves, year after year thousands of pilgrims are thronging to the supposed last resting-place of a poor Hebrew woman.

The boy next conducted us to a stony field, by which, as he said, the Virgin once passed and asked for beans; the owner of the field told her there were none; and, to punish him for his falsehood and lack of charity, the beans were all changed into stones, and the country had remained barren ever since. Paul had been twice to Bethlehem without seeing this field; and he immediately dismounted and joined the boy in searching for the holy petrifications. "It was wonderful," said Paul,

as he picked up some little stones as much like beans as anything else; "and see too," said he, "how barren the country is!" In about an hour we came to the Greek monastery of St Elias; a large stone building, standing on an eminence, and commanding a fine view of Bethlehem. Stopping to water my horse at a fountain in front of the monastery, I turned to take a last look at Bethlehem; and my horse moving a few paces, when I turned again I saw in full view the holy city of Jerusalem. I did not expect it, and was startled by its proximity. It looked so small, and yet lay spread out before me so distinctly, that it seemed as if I ought to perceive the inhabitants moving through the streets, and hear their voices humming in my ears. I saw that it was walled all around, and that it stood alone in an extensive waste of mountains, without suburbs, or even a solitary habitation beyond its walls. There were no domes, steeples, or turrets, to break the monotony of its aspect, and even the mosques and minarets made no show. It would have been a relief, and afforded something to excite the feelings, to behold it in ruins, or dreary and desolate like Petra, or with the banner of the Prophet, the blood-red Mussulman flag, waving high above its walls. But all was tame and vacant. There was nothing in its appearance that afforded me a sensation; it did not even inspire me with melancholy; and I probably convict myself when I say that the only image it presented to my mind was that of a city larger and in better condition than the usual smaller class of those within the Turkish dominion. I was obliged to rouse myself by recalling to mind the long train of extraordinary incidents of which that little city had been the theatre, and which made it, in the eyes of the Christian at least, the most hallowed spot on earth. One thing only particularly struck me—it's exceeding stillness. It was about mid-day; but there was no throng of people entering or departing from its gates, no movement of living creatures to be seen beneath its walls. All was as quiet as if the inhabitants were, like the Spaniards, taking their noonday sleep. We passed the Pools of Hezekiah, and came in sight of the Mount of Olives; and now, for the first signs of life, we saw streaming from the gate a long procession of men, women, and children, on dromedaries, camels, and horses, and on foot; pilgrims who had visited Calvary and the holy sepulchre, and were now bending their steps towards Bethlehem.

At every moment the approach was gaining interest; but in a few minutes, while yet about an hour distant from the walls, my attention was diverted from the city by the sudden appearance of our muleteer, who had left us the day before in a pet, and gone on before us to Jerusalem. He was sitting on the ground alone, so wan and wo-begone, so changed from the spruce and well-dressed muleteer who had accompanied us from Hebron, that I scarcely recognised him. Every article of his former dress was gone, from his gay turban to his long boots; and in their stead he displayed an old yellow striped shawl, doing duty as a turban, and a ragged Bedouin gown. Late in the afternoon, while hurrying on to get in before the gates should be closed, he was hailed by four Arabs; and when he attempted to escape by pushing his donkey, he was brought to by a musket-ball passing through the folds of his dress and grazing his side. A hole in his coat, however, did not save it; and according to the Arab mode of robbery, they stripped him to his skin, and left him stark naked in the road. From his manner of telling the story, I am inclined to think that the poor fellow had not conducted himself very valiantly; for though he did not regard the scratch on his side or the risk he had run of his life, he mourned bitterly over the loss of his garments. Arrived in the Holy Land, I had thought danger of all kinds at an end; and I could not help recognising the singular good fortune which had accompanied me thus far, and congratulating myself upon the accident which had detained me at Bethlehem.

We were soon approaching the walls of Jerusalem, and seemed to be almost at their foot; but we were on

one of the mountains that encompass the city, and the deep Valley of Jehoshaphat was yet between us and the holy city—the sacred burying-ground of the Jews, the “gathering-place of nations.” Crossing this valley, we descended on the other side; and in a few moments were on one of the seven hills on which the city is built, and entering at the Bethlehem gate. It was guarded by a Turkish soldier, and half a dozen more lay basking in the sun outside, who raised their heads as I approached, their long mustaches curling as they looked at me; and though they gave me no greeting, they let me pass without any molestation. On the right was the citadel; a soldier was on the walls, and a small red flag, the standard of Mohammed, was drooping against its staff. In front was an open place, irregular, and apparently formed by clearing away the ruins of fallen houses. As in all Turkish cities, the stillness was unbroken; there was no rattling of wheels over the pavements, nor even the tramp of horses.

We wound around the walls, and dismounted at the only asylum for strangers, the Latin Convent. I presented myself to the superior; and after receiving from him a kind and cordial welcome, with the usual apologies for meagre fare on account of its being Lent, went to the room assigned me; and had just sat down to dinner, when my poor muleteer entered in greater distress than ever.

Afraid of the very thing that happened, he had started immediately on his return to Hebron, and at the gate his mules were seized by a soldier for the use of the government. It was in a spirit of perfect wretchedness that the poor fellow, still smarting under the loss of his clothes, almost threw himself at my feet, and begged me to intercede for him. I was, of course, anxious to help him if I could, and immediately rose to go with him; but Paul told me to remain quiet, and he would settle the matter in five minutes. Paul was a great admirer of the pacha. Wherever his government was established, he had made it safe for the traveller; and Paul's courage always rose and fell according to the subdued or unsubdued state of the population. In the city of Jerusalem the wind could scarcely blow without the leave of Ibrahim Pacha; and Paul had mounted on stilts almost as soon as we crossed the threshold of the gate. He had already been at his old tricks of pushing the unresisting Arabs about, and kicking them out of the way, as in the miserable villages on the Nile; and, strong in the omnipotence of the firman, he now hurried to the gate; but he came back faster than he went. I have no doubt that he was very presuming and impudent, and richly deserved more than he got; but at all events he returned on a full run, and in a towering passion. The soldier had given him the usual Mussulman abuse, showering upon him the accustomed “dog” and “Christian;” and, moreover, had driven him to the verge of madness by calling him a “Jew,” and threatening to whip both him and his master. Paul ran away from what I am inclined to believe would have been his share, as the Arabs had taken part against him; and, burning with the indignity of being called a Jew, begged me to seek redress of the governor. I was roused myself, not so much by the particular insult to Paul, as by the general intention of the thing, and the disconsolate figure of my poor muleteer; and leaving my unfinished meal, with my firman in my hand, and Paul and the muleteer at my heels, I started for the palace of the governor.

Old things and new are strangely blended in Jerusalem; and the residence of the Turkish governor is in the large building which to this day bears the name of Pontius Pilate. Paul told me its history as we were ascending the steps; and it passed through my mind as a strange thing, that almost the first moment after entering the city, I was making a complaint, perhaps in the same hall where the Jews had complained of Christ before Pontius Pilate, having with me a follower of that Christ whom the Jews reviled and buffeted, burning under the indignity of being called a Jew.

The governor, as is the custom of governors in the

East, and probably as Pontius Pilate did in the time of our Saviour, sat in a large room, ready to receive every body who had any complaint to make; his divan was raised platform, on an iron camp-bedstead, covered with rich Turkey rugs, and over them a splendid lion-skin. His face was noble, and his long black beard the finest I ever saw; a pair of large pistols and a Damascus sabre were lying by his side, and a rich fur cloak, thrown back over his shoulders, displayed a form that might have served as a model for a Hercules. Altogether, he reminded me of Richard in his tent on the plains of Acre. At the moment of my entry, he was breathing on a brilliant diamond, and I noticed on his finger an uncommonly beautiful emerald. He received me with great politeness; and when I handed him the pacha's firman, with a delicacy and courtesy I never saw surpassed, he returned it to me unopened and unread, telling me that my dress and appearance were sufficient recommendation to the best services in his power. If the reader would know what dress and appearance are a sufficient recommendation to the best offices of a Turkish governor, I will merely mention that, having thrown off, or rather having been stripped of, most of my Turkish dress at Hebron, I stood before the governor in a red toubouch, with a long black silk tassel, a blue roundabout jacket buttoned up to the throat, grey pantaloons, boots splashed with mud, a red sash, a pair of large Turkish pistols, sword, and my Nubian club in my hand; and the only decided mark of aristocracy about me was my beard, which, though not so long as the governor's, far exceeded it in brilliancy of complexion.

The few moments I had had for observation, and the courteous demeanour of the governor, disarmed me of my anger; and coffee and the first pipe over, I stated my grievances very dispassionately. Paul's wrath was still dominant, and I have no doubt he represented the conduct of the soldier as much worse than it was; for the governor, turning to me without any further inquiries, asked if he should have him bastinadoed. This summary justice startled even Paul; and feeling a little ashamed of my own precipitation, I was now more anxious to prevent punishment than I had before been to procure it; and begged him to spare the soldier, and merely order him to release the mules. Without another word he called a janizary, and requesting me to wait, ordered him to accompany Paul to the gate where the scene took place; and when Paul returned, the muleteer, with a thankful heart, was already on his way to Hebron. I had the satisfaction of learning, too, that the officers were on the track of the robbers who had stripped him, and before morning the governor expected to have them in custody.

Several times afterwards I called upon the governor, and was always treated with the same politeness. Once, when I was walking alone outside the walls, I met him sitting on the grass, with his janizaries and slaves standing up around him; and the whole Turkish population being out wandering among the tombs, he procured for me a respect and consideration which I think were useful to me afterwards, by calling me to a seat beside him, and giving me the pipe from his own mouth. Some months afterwards, at Genoa, I saw a brief article in an Italian paper, referring to a previous article, giving an account of a then late revolution there, in which the governor was on the point of falling into the hands of the insurgents. I have never seen any account of the particulars of this revolution, and do not know whether he is now living or dead. In the East, life hangs by so brittle a thread, that when you part from a man in power, in all probability you will never see him again. I can only hope that the Governor of Jerusalem still lives, and that his condition in life is as happy as when I saw him.

It was Saturday afternoon when I arrived at Jerusalem. I had a letter of introduction to Mr Thompson, an American missionary, and the first thing I did was to look for him. One of the monks of the convent gave me the direction to the American priest, not knowing his name; and instead of Mr Thompson, I found Mr

Whiting, who had been there about a year in his place. Like the governor, Mr Whiting did not want any credentials; but here, being among judges, it was not my dress and appearance that recommended me. I was an American, and at that distance from home the name of countryman was enough. In the city of Jerusalem such a meeting was to him a rare and most welcome incident; while to me, who had so long been debarred all conversation except with Paul and the Arabs, it was a pleasure which few can ever know, to sit down with a compatriot, and once more, in my native tongue, hold converse of my native land.

Each of us soon learned to look upon the other as a friend; for we found that an old friend and schoolmate of mine had been also a friend and schoolmate of his own. He would have had me stay at his house; but I returned to the convent, and with my thoughts far away, and full of the home of which we had been talking, I slept for the first night in the city of Jerusalem.

The first and most interesting object within the walls of the holy city, the spot to which every pilgrim first directs his steps, is the Holy Sepulchre. The traveller who has never read the descriptions of those who have preceded him in a pilgrimage through the Holy Land, finds his expectations strangely disappointed, when, approaching this hallowed tomb, he sees around him the tottering houses of a ruined city, and is conducted to the door of a gigantic church.

This edifice is another, and perhaps the principal, monument of the Empress Helena's piety. What authority she had for fixing here the site of the Redeemer's burial-place, I will not stop to inquire. Doubtless she had her reasons; and there is more pleasure in believing, than in raising doubts which cannot be confirmed. In the front of the church is a large courtyard, filled with dealers in beads, crucifixes, and relics; among the most conspicuous of whom are the Christians of Bethlehem, with figures of the Saviour, the Virgin, and a host of saints, carved from mother-of-pearl, in all kinds of fantastic shapes. It was precisely the time at which I had wished and expected to be in Jerusalem—the season of Easter—and thousands of pilgrims, from every part of the Eastern world, had already arrived for the great ceremonies of the holy week. The court was thronged with them, crowded together, so that it was almost impossible to move, and waiting, like myself, till the door of the church should be opened.

The Holy Sepulchre, as in the days when all the chivalry of Europe armed to wrest it from them, is still in the hands of the infidels; and it would have made the sword of an old crusader leap from its scabbard to behold a haughty Turk, with the air of a lord and master, standing sentinel at the door, and with his long mace beating and driving back the crowd of struggling Christians. As soon as the door was opened, a rush was made for entrance; and as I was in the front rank, before the impetus ceased, amid a perfect storm of pushing, yelling, and shouting, I was carried almost headlong into the body of the church. The press continued behind, hurrying me along, and kicking off my shoes; and in a state of desperate excitement both of mind and body, utterly unsuited to the place and time, I found myself standing over the so-called tomb of Christ; where, to enhance the incongruity of the scene, at the head of the sepulchre stood a long-bearded monk, with a plate in his hand, receiving the paras of the pilgrims. My dress marked me as a different person from the miserable, beggarly crowd before me; and expecting a better contribution from me, at the tomb of him who had pronounced that all men are equal in the sight of God, with an expression of contempt like the "canaille" of a Frenchman, and with kicks, cuffs, and blows, he drove back those before me, and gave me a place at the head of the sepulchre. My feelings were painfully disturbed, as well by the manner of my entrance as by the irroverent demeanour of the monk; and disappointed, disgusted, and sick at heart, while hundreds were still struggling for admission, I turned away and left the church. A warmer imagination than

mine could perhaps have seen, in a white marble sarcophagus, "the sepulchre hewn out of a rock," and in the fierce struggling of these barefooted pilgrims the devotion of sincere and earnest piety, burning to do homage in the holiest of places; but I could not.

It was refreshing to turn from this painful exhibition of a deformed and degraded Christianity to a simpler and purer scene. The evening before, Mr Whiting had told me that religious exercises would be performed at his house the next day, and I hastened from the church to join in the grateful service. I found him sitting at a table, with a large family Bible open before him. His wife was present, with two little Armenian girls, whom she was educating to assist her in her school; and I was not a little surprised to find that, when I had taken my seat, the congregation was assembled. In fact, Mr Whiting had only been waiting for me; and as soon as I came in, he commenced the service to which I had been so long a stranger. It was long since I had heard the words of truth from the lips of a preacher; and as I sat with my eyes fixed upon the Garden of Gethsemane and the Mount of Olives, I could not help thinking of it as a strangely-interesting fact, that here, in the holy city of Jerusalem, where Christ preached and died, though thousands were calling upon his name, the only persons who were praising him in simplicity and truth were a missionary and his wife, and a passing traveller, all from a far-distant land. I had, moreover, another subject of reflection. In Greece I had been struck with the fact that the only schools of instruction were those established by American missionaries, and supported by the liberality of American citizens; that our young republic was thus, in part, discharging the debt which the world owes to the ancient mistress of science and the arts, by sending forth her sons to bestow the elements of knowledge upon the descendants of Homer and Pericles, Plato and Aristotle; and here, on the very spot whence the apostles had gone forth to preach the glad tidings of salvation to a ruined world, a missionary from the same distant land was standing as an apostle over the grave of Christianity, a solitary labourer striving to re-establish the pure faith and worship that were founded on this spot eighteen centuries ago.

#### CHAPTER XXVIII.

Church of the Holy Sepulchre.—An unexpected Discovery.—Mount Calvary.—The Sepulchre.—The Valley of Jehoshaphat.—The Garden of Gethsemane.—Place of the Temple.—The four Great Tombs.—Siloa's Brook.

DURING my stay in Jerusalem, a day seldom passed in which I did not visit the Church of the Holy Sepulchre, but my occupation was chiefly to observe the conduct of the pilgrims; and if the reader will accompany me into the interior, he will see what I was in the habit of seeing every day.

The key of the church is kept by the governor of the city; the door is guarded by a Turk, and opened only at fixed hours, and then only with the consent of the three convents, and in the presence of their several dragomen; an arrangement which often causes great and vexatious delays to such as desire admittance. This formality was probably intended for solemnity and effect, but its consequence is exactly the reverse; for as soon as the door is opened, the pilgrims, who have almost always been kept waiting for some time, and have naturally become impatient, rush in, struggling with each other, overturning the dragomen, and thumped by the Turkish doorkeeper, and are driven like a herd of wild animals into the body of the church. I do not mean to exaggerate a picture, the lightest of whose shades is already too dark. I describe only what I saw, and with this assurance the reader must believe me when I say that I frequently considered it putting life and limb in peril to mingle in that crowd. Probably it is not always so; but there were at that time within the walls of Jerusalem from ten to twenty thousand pilgrims, and all had come to visit the Holy Sepulchre.

Supposing, then, the rush to be over, and the traveller to have recovered from its effects, he will find himself in a large apartment, forming a sort of vestibule; on the left, in a recess of the wall, is a large divan, cushioned and carpeted, where the Turkish doorkeeper is usually sitting, with half a dozen of his friends, smoking the long pipe and drinking coffee, and always conducting himself with great dignity and propriety. Directly in front, surmounted by an iron railing, having at each end three enormous wax candles more than twenty feet high, and suspended above it a number of silver lamps of different sizes and fashions, gifts from the Catholic, Greek, and Armenian convents, is a long flat stone, called the "stone of unction;" and on this, it is said, the body of our Lord was laid when taken down from the cross, and washed and anointed in preparation for sepulture. This is the first object that arrests the pilgrims on their entrance; and here they prostrate themselves in succession, the old and the young, women and children, the rich man and the beggar, and all kiss the sacred stone. It is a slab of polished white marble; and one of the monks, whom I questioned on the subject as he rose from his knees, after kissing it most devoutly, told me that it was not the genuine stone, which he said was under it, the marble having been placed there as an ornamental covering, and to protect the hallowed relic from the abuses of the Greeks.

On the left is an iron circular railing, in the shape of a large parrot's cage, having within it a lamp, and marking the spot where the women sat while the body was anointed for the tomb. In front of this is an open area, surrounded by high square columns, supporting a gallery above. The area is covered by a dome, imposing in appearance and effect; and directly under, in the centre of the area, is an oblong building, about twenty feet long and twelve feet high, circular at the back, but square and finished with a platform in front; and within this building is the holy sepulchre.

Leaving for a moment the throng that is constantly pressing at the door of the sepulchre, let us make the tour of the church. Around the open space under the dome are small chapels for the Syrians, Copts, Maronites, and other sects of Christians who have not, like the Catholics, the Greeks and Armenians, large chapels in the body of the church. Between two of the pillars is a small door, opening to a dark gallery, which leads, as the monks told me, to the tombs of Joseph and Nicodemus, between which and that of the Saviour there is a subterranean communication. These tombs are excavated in the rock, which here forms the floor of the chamber. Without any expectation of making a discovery, I remember that once, in prying about this part of the building alone, I took the little taper that lighted the chamber, and stepped down into the tomb; and I had just time to see that one of the excavations never could have been intended for a tomb, being not more than three feet long, when I heard the footsteps of pilgrim visitors, and scrambled out with such haste that I let the taper fall, put out the light, and had to grope my way back in the dark.

Farther on, and nearly in range of the front of the sepulchre, is a large opening, forming a sort of court to the entrance of the Latin chapel. On one side is a gallery, containing a fine organ; and the chapel itself is neat enough, and differs but little from those in the churches of Italy. This is called the chapel of apparition, where Christ appeared to the Virgin. Within the door, on the right, in an enclosure, completely hidden from view, is the pillar of flagellation, to which our Saviour was tied when he was scourged, before being taken into the presence of Pontius Pilate. A long stick is passed through a hole in the enclosure, the handle being outside, and the pilgrim thrusts it in till it strikes against the pillar, when he draws it out and kisses the point. Only one half of the pillar is here; the other half is in one of the churches at Rome, where may also be seen the table on which our Saviour ate his last supper with his disciples, and the stone on which the cock crowed when Peter denied his master!

Going back again from the door of the chapel of apparition, and turning to the left, on the right is the outside of the Greek chapel, which occupies the largest space in the body of the church; and on the left is a range of chapels and doors, the first of which leads to the prison where, they say, our Saviour was confined before he was led to crucifixion. In front of the door is an unintelligible machine, described as the stone on which our Saviour was placed when put in the stocks. I had never heard of this incident in the story of man's redemption, nor, in all probability, has the reader; but the Christians in Jerusalem have a great deal more of such knowledge than they gain from the Bible. Even Paul knew much that is not recorded in the sacred volume; for he had a book, written by a priest in Malta, and giving many particulars in the life of our Saviour which all the evangelists never knew, or, knowing, have entirely omitted.

Next is the chapel where the soldier who struck his spear into the side of the Redeemer, as he hung upon the cross, retired and wept over his transgression. Beyond this is the chapel where the Jews divided Christ's raiment, and "cast lots for his vesture." The next is one of the most holy places in the church, the chapel of the cross. Descending twenty-eight broad marble steps, the visitor comes to a large chamber eighteen paces square, dimly lighted by a few distant lamps; the roof is supported by four short columns with enormous capitals. In front of the steps is the altar, and on the right a seat on which the Empress Helena, advised by a dream where the true cross was to be found, sat and watched the workmen who were digging below. Descending again fourteen steps, another chamber is reached, darker and more dimly lighted than the first, and hung with faded red tapestry; a marble slab, having on it a figure of the cross, covers the mouth of the pit in which the true cross was found. The next chapel is over the spot where our Saviour was crowned with thorns; and under the altar, protected by an iron grating, is the very stone on which he sat. Then the visitor arrives at Mount Calvary.

A narrow marble staircase of eighteen steps leads to a chapel about fifteen feet square, paved with marble in mosaic, and hung on all sides with silken tapestry and lamps dimly burning; the chapel is divided by two short pillars, hung also with silk, and supporting quadrangular arches. At the extremity is a large altar, ornamented with paintings and figures; and under the altar a circular silver plate, with a hole in the centre, indicating the spot in which rested the step of the cross. On each side of the hole is another, the two designating the places where the crosses of the two thieves were erected; and near by, on the same marble platform, is a crevice about three feet long and three inches wide, having brass bars over it and a covering of silk. Removing the covering, by the aid of a lamp I saw beneath a fissure in a rock; and this, say the monks, is the rock which was rent asunder when our Saviour, in the agonies of death, cried out from the cross, "My God, my God, why hast thou forsaken me?" Descending to the floor of the church, underneath is an iron grating which shows more distinctly the fissure in the rock; and directly opposite is a large monument over the head of —Adam.

The reader will probably think that all these things are enough to be comprised under one roof; and having finished the tour of the church, I returned to the great object of the pilgrimage to Jerusalem—the Holy Sepulchre. Taking off the shoes on the marble platform in front, the visitor is admitted by a low door, on entering which the proudest head must needs do reverence. In the centre of the first chamber is the stone which was rolled away from the mouth of the sepulchre—a square block of marble, cut and polished; and though the Armenians have lately succeeded in establishing the genuineness of the stone in their chapel on Mount Sion (the admission by the other monks, however, being always accompanied by the assertion that they stole it), yet the infatuated Greek still kisses and

adores this block of marble as the very stone on which the angel sat when he announced to the women, "He is not dead; he is risen; come see the place where the Lord lay." Again bending the head, and lower than before, the visitor enters the inner chamber, the holiest of holy places. The sepulchre "hewn out of the rock" is a marble sarcophagus, somewhat resembling a common marble bathing-tub, with a lid of the same material. Over it hang forty-three lamps, which burn without ceasing night and day. The sarcophagus is six feet one inch long, and occupies about one half of the chamber; and one of the monks being always present to receive the gifts or tribute of the pilgrims, there is only room for three or four at a time to enter. The walls are of a greenish marble, usually called verd antique, and this is all. And it will be borne in mind that all this is in a building above ground, standing on the floor of the church.

If I can form any judgment from my own feelings, every man other than a blind and determined enthusiast, when he stands by the side of that marble sarcophagus, must be ready to exclaim, "This is not the place where the Lord lay;" and yet I must be wrong, for sensible men have thought otherwise; and Dr Richardson, the most cautious traveller in the Holy Land, speaks of it as the "Mansion of victory, where Christ triumphed over the grave, and disarmed death of all its terrors." The feelings of a man are to be envied who can so believe. I cannot imagine a higher and holier enthusiasm; and it would be far more agreeable to sustain than to dissolve such illusions; but although I might be deceived by my own imagination and the glowing descriptions of travellers, I would at least have the merit of not deceiving others. The sepulchre of Christ is too holy a thing to be made the subject of trickery and deception; and I am persuaded that it would be far better for the interests of Christianity that it had remained for ever locked up in the hands of the Turks, and all access to it been denied to Christian feet.

But I was not disposed to cavil. It was far easier, and suited my humour far better, to take things as I found them; and in this spirit, under the guidance of a monk, and accompanied by a procession of pilgrims, I wandered through the streets of Jerusalem; visited the Pool of Bethesda, where David saw Bethsheba bathing; the five porches where the sick were brought to be healed; the house of Simon the Pharisee, where Mary Magdalene confessed her sins; the prison of St Peter; the house of Mary the mother of Mark; the mansion of Dives and the house of Lazarus (which, by the way, not to be sceptical again, did not look as if its tenant had ever lain at its neighbour's gate, and begged for the "crumbs which fell from the rich man's table"); and entering the Via Dolorosa, the way by which the Saviour passed from the judgment-hall of Pilate to Calvary, saw the spot where the people laid hold of Simon the Cyrene, and compelled him to bear the cross; three different stones on which Christ, fainting, sat down to rest; passed under the arch called *Ecce Homo*, and looked up at the window from which the Roman judge exclaimed to the persecuting Jews, "Behold the man!"

But if the stranger leaves the walls of the city, his faith is not so severely tested; and for my own part, disposed to indemnify myself for my unwilling scepticism, the third day after my arrival at Jerusalem, on a bright and beautiful morning, with my Nubian club in my hand, which soon became the terror of all the cowardly dogs in Jerusalem, I stood on the threshold of St Stephen's Gate. Paul was with me; and stopping for a moment among the tombs in the Turkish burying-ground, we descended towards the bridge across the brook Kedron, and the mysterious valley of Jehoshaphat. Here I was indeed among the hallowed places of the Bible. Here all was as nature had left it, and spared by the desecrating hand of man; and as I gazed upon the vast sepulchral monuments, the tombs of Absalom, of Zachariah, and Jehoshaphat, and the thousands and tens of thousands of Hebrew tombstones covering the

declivity of the mountain, I had no doubt I was looking upon that great gathering-place, where, three thousand years ago, the Jew buried his dead under the shadow of the Temple of Solomon; and where, even at this day, in every country where his race is known, it is the dearest wish of his heart that his bones may be laid to rest among those of his long-buried ancestors.

Near the bridge is a small table-rock, revered as the spot where Stephen the Martyr was stoned to death; but even here one cannot go far without finding the handiwork of the Lady Helena. A little to the left is the tomb of Joseph and Mary. Descending a few steps to a large marble door, opening to a subterraneous church, excavated from the solid rock, and thence by a flight of fifty marble steps, each twenty feet long, we come to the floor of the chamber. On the right, in a large recess, is the tomb of the Virgin, having over it an altar, and over the altar a painting representing her death-bed, with the Son standing over her, to comfort her and receive her blessing. This is an interesting domestic relation in which to exhibit a mother and her son, but rather inconsistent with the Bible account of the Virgin Mother being present at the crucifixion of our Lord. Indeed, it is a singular fact, that with all the pious homage which they pay to the Son of God, adoring him as equal with the Father in power and goodness, and worshipping the very ground on which he is supposed to have trodden, there is still among the Christians of the East a constant tendency to look upon him as a man of flesh. In a community like ours, governed by an universal sentiment of the spiritual character of our Saviour, it would be regarded as setting at defiance the religious impressions of the people even to repeat what is talked of familiarly by the people of the East; but at the risk of incurring this reproach, it is necessary to illustrate their character, to say that I have heard them talk of the Saviour, and of every incident in his history, as a man with whom they had been familiar in his life; of the Virgin nursing the "little Jesus" of his stature, strength, age, the colour of his hair, his complexion, and of every incident in his life, real or supposed, from his ascension into heaven down to the "washing of his linen."

At the foot of the hill on the borders of the Valley of Jehoshaphat, beneath the Mount of Olives, we came to the Garden of Gethsemane. Like the great battle-grounds where kingdoms have been lost and won, the stubborn earth bears no traces of the scenes that have passed upon its surface; and a stranger might easily pass the Garden of Gethsemane without knowing it as the place where, on the night on which he was betrayed, the Saviour watched with his disciples. It was enclosed by a low, broken stone fence, and an Arab Fellow was quietly turning up the ground with his spade. According to my measurement, the garden is forty-seven paces long, and forty-four wide. It contains eight olive-trees, which the monks believe to have been standing in the days of our Saviour, and to which a gentleman, in whose knowledge I have confidence, ascribed an age of more than eight hundred years. One of these, the largest, barked and scarified by the knives of pilgrims, is revered as the identical tree under which Christ was betrayed; and its enormous roots, growing high out of the earth, could induce a belief of almost any degree of antiquity. A little outside the fence of the garden is a stone, revered as marking the hallowed place where Christ, in the agony of his spirit, prayed that the cup might pass from him; a little farther, where he "swate great drops of blood;" and a little farther is the spot to which he returned, and found the disciples sleeping; and no good pilgrim ever passes from the Garden of Gethsemane to the Mount of Olives without doing reverence in these holy places.

In company with a long procession of pilgrims, who had been assembling in the garden, we ascended the Mount of Olives. The mount consists of a range of four mountains, with summits of unequal altitudes. The highest rises from the Garden of Gethsemane, and is the one fixed upon as the place of our Saviour's ascen-

sion. About half way up is a ruined monastery, built, according to the monks, over the spot where Jesus sat down and wept over the city, and uttered that prediction which has since been so fearfully verified. The olive still maintains its place on its native mountain, and now grows spontaneously upon its top and sides, as in the days of David and our Saviour. In a few moments we reached the summit, the view from which embraces, perhaps, more interesting objects than any other in the world; the Valley of Jehoshaphat, the Garden of Gethsemane, and the city of Jerusalem, the Plains of Jericho, the Valley of the Jordan, and the Dead Sea.

On the top of the mountain is a miserable Arab village, in the centre of which is a small octagonal building, erected, it is said, over the spot from which our Saviour ascended into heaven; and the print of his foot, say the monks, is still to be seen. This print is in the rock, enclosed by an oblong border of marble; and pilgrims may at any time be seen taking, in wax, impressions of the holy footprint; and for this, too, they are indebted to the research and bounty of the Empress Helena.

Descending again to the ruined monastery, at the place where our Saviour, more than 1800 years ago, wept over the city and predicted its eternal ruin, I sat down on a rough stone to survey and muse over the favoured and fallen Jerusalem. The whole city lay extended before me like a map. I could see and distinguish the streets, and the whole interior to the inner side of the farther wall; and oh! how different from the city of our Saviour's love! Though even then but a mere appendage of imperial Rome, it retained the magnificent wonders of its Jewish kings, and, pre-eminent even among the splendid fanes of heathen worship, rose the proud temple of the great King Solomon. Solomon and all his glory have departed; centuries ago the great temple which he built, "the glory of the whole earth," was a heap of ruins; in the prophetic words of our Saviour, not one stone was left upon another; and, in the wanton spirit of triumph, a conquering general drove his plough over its site. For years its very site lay buried in ruins, till the Saracen came with his terrible war-cry, "The Koran or the sword;" and the great Mosque of Omar, the holy of holies in the eyes of all true believers, now rears its lofty dome upon the foundations of the Temple of Solomon.

From the place where I sat, the Mosque of Omar was the only object that relieved the general dullness of the city, and all the rest was dark, monotonous, and gloomy; no spires reared their tapering points to the skies, nor domes nor minarets, the pride and ornament of other Turkish cities. All was as still as death; and the only apparent sign of life was the straggling figure of a Mussulman, with his slippers in his hand, stealing up the long courtyard to the threshold of the mosque. The Mosque of Omar, like the great mosque at Mecca, the birthplace of the Prophet, is regarded with far more veneration than even that of St Sophia, or any other edifice of the Mohammedan worship; and to this day the Koran or the sword is the doom of any bold intruder within its sacred precincts. At the northern extremity of the mosque is the Golden Gate, for many years closed, and flanked with a tower, in which a Mussulman soldier is constantly on guard; for the Turks believe that, by that gate, the Christians will one day enter and obtain possession of the city—city of mystery and wonder, and still to be the scene of miracles! "It shall be trodden down by the Gentiles until the time of the Gentiles be fulfilled;" and the time shall come when the crescent shall no longer glitter over its battlements, nor the banner of the Prophet wave over its walls.

Returning to the Valley of Jehoshaphat, and passing along its eastern side, we came to the great burying-ground of the Jews. Among its monuments are four, unique in their appearance and construction, and known from time immemorial as the tombs of Absalom, Jehoshaphat, St James, and the prophet Zachariah. All are cut out of the solid rock; the tomb of Absalom is a single stone, as large as an ordinary two-story house, and ornamented with twenty-four semi-columns of the

Doric order, supporting a triangular pyramidal top. The top is battered and defaced; and no pilgrim, whether Jew or Christian, ever passes through the Valley of Jehoshaphat without casting a stone at the sepulchre of the rebellious son. No entrance to this sepulchre has ever been discovered; and the only way of getting into the interior is by a hole broken for the purpose in one of the sides.

Behind the tomb of Absalom is that of Jehoshaphat, "the King of Judah, who walked in the ways of the Lord." It is an excavation in the rock, the door being its only ornament. The interior was damp, the water trickling from the walls, and nearly filled with sand and crumbling stones. The next is the tomb of St James, standing out boldly in the side of the mountain, with a handsome portico of four columns in front, an entrance at the side, and many chambers within. After this is the tomb of Zachariah, like that of Absalom hewn out of the solid rock; and like that, too, having no known entrance. Notwithstanding the specific names given to these tombs, it is altogether uncertain to what age they belong; and it is generally considered that the style of architecture precludes the supposition that they are the work of Jewish builders.

Leaving them after a cursory examination, we descended the valley; and following the now dry bed of the Kedron, we came to "Siloa's brook, that flowed fast by the oracle of God," which, coming from the foot of Mount Zion, here presents itself as a beautiful stream, and runs winding and murmuring through the valley. Hundreds of pilgrims were stretched on its bank; and a little above is the sacred pool issuing from the rock, enclosed by stone walls, with a descent by two flights of steps. "Go wash in the pool of Siloam," said Christ to the man who was born blind; and, like myself, a number of pilgrims were now bending over the pool, and washing in its hallowed waters. Passing by the great tree under which the Prophet Isaiah was sawed asunder, I turned up towards the city, and in a few minutes was standing on Mount Zion.

## CHAPTER XXIX.

The Field of Blood.—A Traveller's Compliment.—Singular Ceremony.—A Ragged Rascal.—Ostentatious Humility.—Pride must have a Fall.—An Ancient Relic.—Summary Legislation.

ALL that is interesting about Jerusalem may be seen in a few days. My health compelled me to remain there more than three weeks, during which I made two excursions, one to the ancient city of Joppa, and the other to the Dead Sea. As soon as I could do so, however, I visited all the places, to see which is the business of a pilgrim to the holy city. The fourth morning after my arrival, I went out at the Bethlehem Gate, and, crossing the valley of the sons of Hinmon, on the side of the opposite mountain I came to the Acladama, or field of blood, the field bought with "the thirty pieces of silver," which to this day remains a public burying-place or potter's field. A large chamber excavated in the rock is still the charnel-house of the poor and unhonoured dead of Jerusalem. The fabulous account is, that the earth of that field will in forty-eight hours consume the flesh from off the bones committed to it.

Leaving this resting-place of poverty, and perhaps of crime, I wandered among the tombs on the sides of the mountain—tombs ornamented with sculpture, and divided into chambers, the last abodes of the great and rich of Jerusalem; but the beggar, rudely thrown into the common pit in the potter's field, and the rich man laid by pious hands in the sculptured sepulchre of his ancestors, are alike nothing.

Outside the Damascus Gate, and about half a mile distant, is what is called the Sepulchre of the Kings of Judah. This sepulchre is hewn out of the rock, and has in front a large square excavation, the entrance to which is under a small arch. To the left, on entering, is a large portico, nine paces long, and four wide, with an architrave, on which are sculptured fruit and flowers,

much defaced; and at the end, on the left, a hole, filled up with stones and rubbish, barely large enough to enable one to crawl through on hands and knees, leads to a chamber eight paces square; and from this chamber there are three doors, two directly opposite, and one to the right. Entering that to the right, we found ourselves in another chamber, on each of the three sides of which was a large door, with smaller ones on either side, opening to small receptacles, in each of which were places for three bodies. The door of this chamber, now lying on the floor, was a curious work. It had been cut from the solid rock, and made to turn on its hinges or sockets without having ever been removed from its place. On the right, a single door leads down several steps into a dark chamber, where we found the lid of a sarcophagus elegantly carved. The other doors opening from the great chamber lead to others inferior in size and workmanship. On coming out of one of them, at the very moment when I extinguished my light, the hole of entrance was suddenly darkened and stopped up. I had left a strange Arab at the door; and remembering the fearful thought that had often come over me while creeping among the tombs in Egypt, of being shut up and entombed alive, my first impulse was to curse my folly in coming into such a place, and leaving myself so completely in the power of a stranger. But I was taking the alarm too soon. It was only the Arab himself coming in. He, too, had his apprehensions; and, from my remaining so long within, began to fear that I had crawled out some back way, and given his bucksheesh the slip.

But enough of the tombs. I leave the abodes of the dead, and turn to the living; and among the living in Jerusalem, there are few who live better than the monks. Chateaubriand, in his poetical description of his pilgrimage to the Holy Land, gives an exceeding interest to the character of these monks. "Here reside," said he, "communities of Christian monks whom nothing can compel to forsake the tomb of Christ; neither plunder, nor personal ill treatment, nor menaces of death itself. Night and day they chant their hymns around the holy sepulchre. Driven by the edgel and the sabre, women, children, flocks, and herds, seek refuge in the cloisters of these recluses. What prevents the armed oppressor from pursuing his prey, and overthrowing such feeble ramparts? the charity of the monks. They deprive themselves of the last resources of life to ransom their suppliants," &c.

The first glance at the well-fed superior of the convent of Jerusalem dispelled in my mind all such poetic illusions, though the beautiful rhapsody was fully appreciated by those of whom it was uttered. On my first interview with the superior, an old monk entered the room, who was in the convent at the time of the visit of Chateaubriand, and both said that they had read the accounts of several travellers in the Holy Land, and none could be compared with his. I do not mean to speak harshly of them personally, for they were my hosts, and every Eastern traveller knows the comfort of a cell in a convent compared with any other shelter he can find in the Holy Land. Particularly I would not speak harshly of the superior of the convent at Jerusalem, towards whom I have an exceedingly kind feeling, and with whom I was on terms of rather jocular intimacy. The second time I saw him he railed at me with much good-natured indignation for having taken off two or three inches of my beard, and, during the whole time I was in Jerusalem, I was in the habit of calling upon him almost every day. I owe him something, too, on Paul's account, for he did that worthy man-of-all-work a most especial honour.

Since our arrival at the convent, Paul had returned to the essence of his Catholic faith, to wit, the strict observance of its forms. In the desert he had often grumbled at being obliged to go without animal food; but no sooner did he come within the odour of burning incense, than he felt the enormity of ever having entertained so impious a thought, and set himself down like a martyr to the table of the convent. He was, in his

way, an epicure; and it used to amuse me, while placing before him the breast of a chicken, to see him turn his eyes wistfully towards me, and choke himself upon pulse and beans. He went through it all, however, though with a bad grace; and his piety was not lost upon the superior, who sent for him a few mornings after our arrival, and told him that a grand ceremony of washing the feet of the disciples was to take place in the chapel, and desired him to officiate as one of them. It was amusing to see Paul's altered manner on his return. With a dignity, and at the same time a respect, which he seemed all at once to have acquired from his clear understanding of his relative duties, he asked me whether I could spare him the next afternoon, stating the reason, and the honour the superior had done him. I told him, of course, that I would not interfere with his playing such an important part; and as it would be a new character for him to appear in, I should like to be present at the representation. The next day he came to me with his coat buttoned tight across his breast, his boots polished, and hat smoothed to a hair, and told me, with great gravity, that the superior had sent me his particular compliments, and an invitation to be present at the ceremony; and turning away, he remarked, with an air of nonchalance, that a Sicilian priest, who had just left me, and who was arranging to accompany me to the Dead Sea, was to be one of his associates in the ceremony.

Paul was evidently very much lifted up; he was constantly telling Elias, the cook of the convent, that he wanted such and such a thing for to-morrow afternoon; begging me not to make any engagement for to-morrow afternoon; and, in due season, to-morrow afternoon came. I entered my room a little before the time, and found him at rehearsal, with a large tub of water before him, prudently washing his feet beforehand. I was a good deal disposed to bring down his dignity, and told him that it was well enough to rehearse his part, but that he ought to leave at least one foot unwashed, as a sort of bonus for his friend the superior. Paul was a good deal scandalised at my levity of manner, and got out of my reach as soon as he could. Afterwards, however, I saw him in one of the corridors, talking with the Sicilian with a greater accession of dignity than ever. I saw him again in the chapel of the convent, standing in line with his associates; and excepting him, the Sicilian priest, and one monk, who was put in to fill up, I never saw a set of harder-looking scoundrels.

This ceremony of washing the feet of the disciples, intended by our Saviour as a beautiful lesson of humility, is performed from year to year, ostensibly to teach the same lesson; and in this case the humility of the superior was exalted shamefully at the expense of the disciples. Most of the twelve would have come under the meaning, though inexplicable, term of "loafer;" but one, a vagrant Pole, was, beyond all peradventure, the greatest blackguard I ever saw. A black muslin frock coat, dirty and glossy from long use, buttoned tight across the breast, and reaching down to his ankles, and an old foxy, low-crowned hat, too big for him, and almost covering his eyes and ears, formed his entire dress, for he had no trousers, shoes, or shirt; he was snub-nosed, peck-marked, and sore-eyed; wore a long beard, and probably could not remember the last time he had washed his face; thick, then, of his feet. If Paul had been dignified, he was puffed up almost to bursting; and the self-complacency with which he looked upon himself and all around him was admirable beyond description. By great good fortune for my designs against Paul, the Pole stood next, and before him in the line of the *quasi* disciples; and it was refreshing to turn from the consequential and complacent air of the one to the crestfallen look of the other; and to see him, the moment he caught my eye, with a suddenness that made me laugh, turn his head to the other side; but he had hardly got it there before he found me on that side too; and so I kept him watching and dodging, and in a perpetual fidget. To add to his mor-

tification, the Pole seemed to take particularly to him; and as he was before him in the line, was constantly turning round and speaking to him with a patronising air; and I capped the climax of his agony by going up in a quiet way, and asking him who was the gentleman before him. I could see him wince, and for a moment I thought of letting him alone; but he was often on stilts, and I seldom had such an opportunity of pulling him down. Besides, it was so ludicrous, I could not help it. If I had had any one with me to share the joke, it would have been exquisite. As it was, when I saw his determination to dodge me, I neglected every thing else, and devoted myself entirely to him; and, let the poor fellow turn where he would, he was sure to find me leaning against a pillar, with a smile on my face and my eyes intently fixed upon him; occasionally I would go up and ask him some question about his friend before him; and finally, as if I could not joke about it any more, and felt on my own account the indignity offered to him, I told him that, if I were he, I would not stand it any longer; that I was ashamed to see him with such a pack of rascals; that they had made a cat's-paw of him, and advised him to run for it, saying that I would stand by him against a bull from the pope. He now spoke for the first time, and told me that he had been thinking of the same thing; and, by degrees, actually worked himself up to the desperate pitch of incurring the hazard of excommunication, if it must needs be so, and had his shoes and stockings in his hands ready for a start, when I brought him down again by telling him it would soon be over; and, although he had been most shamefully treated, that he might cut the gentleman next to him whenever he pleased.

After goading him as long as he could possibly bear, I left him to observe the ceremony. At the upper end of the chapel, placed there for the occasion, was a large chair, with a gilded frame and velvet back and cushion, intended as the seat of the nominal disciple. Before it was a large copper vase, filled with water, and a plentiful sprinkling of rose-leaves; and before that, a large red velvet cushion, on which the superior kneeled to perform the office of lavation. I need not suggest how inconsistent was this display of gold, rose-water, and velvet, with the humble scene it was intended to represent; but the tinsel and show imposed upon the eyes for which they were intended.

One after the other the disciples came up, seated themselves in the chair, and put their feet in the copper vase. The superior kneeled upon the cushion, with both his hands washed the right foot, wiped it with a clean towel, kissed it, and then held it in his hands to receive the kisses of the monks, and of all volunteers that offered. All went on well enough until it came to the turn of Paul's friend and forerunner, the doughty Pole. There was a general titter as he took his place in the chair; and I saw the superior and the monk who assisted him hold down their heads and laugh almost convulsively. The Pole seemed to be conscious that he was creating a sensation, and that all eyes were upon him, and sat with his arms folded, with an ease and self-complacency altogether indescribable, looking down in the vase, and turning his foot in the superior's hands, heel up, toe up, so as to facilitate the process; and when the superior had washed and kissed it, and was holding it up for others to kiss, he looked about him with all the grandeur of a monarch in the act of coronation. Keeping his arms folded, he fairly threw himself back into the huge chair, looking from his foot to the monks, and from the monks to his foot again, as one to whom the world had nothing more to offer. It was more than a minute before any one would venture upon the perilous task of kissing those very suspicious toes, and the monk who was assisting the superior had to go round and drum them up; though he had already kissed it once in the way of his particular duty, to set an example he kissed it a second time; and now, as if ashamed of their backwardness, two or three rushed forward at once; and, the ice once broken, the effect seemed electric, and

there was a greater rush to kiss his foot than there had been to any of the others.

It was almost too hard to follow Paul after this display. I ought to have spared him, but I could not. His mortification was in proportion to his predecessor's pride. He was sneaking up to the chair, when, startled by some noise, he raised his head, and caught the eye which, above all others, he would have avoided. A broad laugh was on my face; and poor Paul was so discomfited that he stumbled, and came near pitching headlong into the vase. I could not catch his eye again; he seemed to have resigned himself to the worst. I followed him round in the procession, as he thrice made the tour of the chapel and corridors, with a long lighted candle in his hand; and then we went down to the superior's room, where the monks, the superior, the twelve, and myself, were entertained with coffee. As the Pole, who had lagged behind, entered after we were all seated, the superior, with the humour of a good fellow, cried out, "Viva Polacca;" all broke out into a loud laugh, and Paul escaped in the midst of it. About an hour afterwards I met him outside the Damascus Gate. Even then he would have shunned me; but I called him, and, to his great relief, neither then nor at any other time referred to the washing of the feet of the disciples.

The reader may remember the kindness with which I had been received by the chief rabbi at Hebron. His kindness did not end there; a few days after my arrival, the chief rabbi of Jerusalem, the high-priest of the Jews in the city of their ancient kings, called upon me, accompanied by a Gibraltar Jew who spoke English, and who told me that they had come at the request of my friend in Hebron, to receive and welcome me in the city of their fathers. I had already seen a great deal of the Jews. I had seen them in the cities of Italy, every where more or less oppressed; at Rome, shut up every night in their miserable quarters as if they were noxious beasts; in Turkey, persecuted and oppressed; along the shores of the Black Sea and in the heart of Russia, looked down upon by the serfs of that great empire of vassalage; and, for the climax of misery, I had seen them contemned and spit upon even by the ignorant and enslaved boors of Poland. I had seen them scattered abroad among all nations, as if had been foretold they would be, every where a separate and peculiar people; and every where, under all poverty, wretchedness, and oppression, waiting for, and anxiously expecting, the coming of a Messiah, to call together their scattered tribes, and restore them to the kingdom of their fathers; and all this the better fitted me for the more interesting spectacle of the Jews in the holy city. In all changes and revolutions, from the day when the kingdom of Solomon passed into the hands of strangers, under the Assyrian, the Roman, the Arab, and the Turk, a remnant of that once-favoured people has always hovered around the holy city; and now, as in the days of David, old men may be seen at the foot of Mount Zion, teaching their children to read from that mysterious book on which they have ever fondly built their hopes of a temporal and eternal kingdom.

The friends made for me by the rabbi at Hebron were the very friends above all others whom I would have selected for myself. While the Christians were preparing for the religious ceremonies of Easter, the Jews were making ready for the great feast of the Passover; and one of the first offers of kindness they made me, was an invitation to wait and partake of it with them. The rabbi was an old man, nearly seventy, with a long white beard, and Aaron himself need not have been ashamed of such a representative. I would have preferred to attach myself particularly to him; but as I could speak neither Arabic nor Hebrew, and the English Jew was not willing to play second, and serve merely as interpreter, I had but little benefit of the old man's society.

The Jews are the best topographers in Jerusalem, although their authority ends where the great interest

of the city begins; for, as their fathers did before them, they deny the name of Christ, and know nothing of the holy places so anxiously sought for by the Christians. That same morning they took me to what they call a part of the wall of Solomon's temple. It forms part of the southern wall of the Mosque of Omar, and is evidently older than the rest, the stones being much larger, measuring nine or ten feet long; and I saw that day, as other travellers may still see every Friday in the year, all the Jews in Jerusalem clothed in their best raiment, winding through the narrow streets of their quarter; and under this hallowed wall, with the sacred volume in their hands, singing, in the language in which they were written, the Songs of Solomon and the Psalms of David. White-bearded old men and smooth-cheeked boys were leaning over the same book; and Jewish maidens, in their long white robes, were standing with their faces against the wall, and praying through cracks and crevices. The tradition which leads them to pray *through* this wall is, that during the building of the temple a cloud rested over it so as to prevent any entrance; and Solomon stood at the door, and prayed that the cloud might be removed, and promised that the temple should be always open to men of every nation desiring to offer up prayers; whereupon the Lord removed the cloud, and promised that the prayers of all people offered up in that place should find acceptance in his sight; and now, as the Mussulman lords it over the place where the temple stood, and the Jews are not permitted to enter, they endeavour to insinuate their prayers through the crevices in the wall, that thus they may rise from the interior to the Throne of Grace. The tradition is characteristic, and serves to illustrate the devoted constancy with which the Israelites adhere to the externals of their faith.

Returning to the convent, and passing through one of the bazaars, we saw an Arab mounted on a bench, and making a proclamation to the crowd around him; and my friend, the Gibraltar Jew, was immediately among them, listening earnestly. The subject was one that touched his tenderest sensibilities as a dealer in money; for the edict proclaimed was one changing the value of the current coin, reducing the tallahree or dollar from twenty-one to twenty piasters, commanding all the subjects of Mohammed Ali to take it at that value, and concluding with the usual finale of a Turkish proclamation, "Death to the offender." My Jew, as he had already told me several times, was the richest Israelite in Jerusalem, and consequently took a great interest in every thing that related to money. He told me that he always cultivated an intimacy with the officer of the mint; and by giving him an occasional present, he always got intimation of any intended change in time to save himself. We parted at the door of the convent, having arranged that I should go with him the next day to the synagogue, and afterwards dine at his house.

### CHAPTER XXX.

The Synagogue.—Ideal Speculation.—A Ride in the Rain.—An Ex-official.—Joppa.—A Moral Phenomenon.—Reverence for the Grave.

ABOUT nine o'clock the next morning I was with him, and in a few moments we were sitting in the highest seats in the synagogue, at the foot of Mount Zion. My old friend the rabbi was in the desk, reading to a small remnant of the Israelites the same law which had been read to their fathers on the same spot ever since they came up out of the land of Egypt. And there they sat, where their fathers had sat before them, with high, black, square-topped caps, with shawls wound around, crossed in front, and laid very neatly; long gowns fastened with a sash, and long beards, the feeble remnant of a mighty people; there was sternness in their faces, but in their hearts a spirit of patient endurance, and a firm and settled resolution to die and be buried under the shadow of their fallen temple.

By the Jewish law the men and women sit apart in the synagogues; and as I could not understand the words of exhortation which fell from the lips of the preacher, it was not altogether unnatural that I should turn from the rough-bearded sons of Abraham to the smooth faces of their wives and daughters. Since I left Europe, I had not been in an apartment where the women sat with their faces uncovered; and, under these circumstances, it is not surprising that I saw many a dark-eyed Jewess who appeared well worthy of my gaze; and it is not a vain boast to say, that while singing the songs of Solomon, many a Hebrew maiden turned her bright black orbs upon me; for, in the first place, on entering we had disturbed more than a hundred sitting on the steps; secondly, my original dress, half Turk, half Frank, attracted the eyes even of the men; and, thirdly, the alleged universal failing of the sex is not wanting among the daughters of Judah.

The service over, we stopped a moment to look at the synagogue, which was a new building, with nothing about it that was peculiar or interesting. It had no gold or silver ornaments; and the sacred scroll, the table of the Law, contained in the holy of holies, was all that the pride of the Jew could show. My friend, however, did not put his own light under a bushel; for, telling me the amount he had himself contributed to the building, he conducted me to a room built at his own expense for a schoolroom, with a stone in the front wall recording his name and generosity.

We then returned to his house; and being about to sit down to dinner with him, I ought to introduce him more particularly to the reader. He was a man about fifty-five, born in Gibraltar to the same abject poverty which is the lot of most of his nation. In his youth he had been fortunate in his little dealings, and had been what we call an enterprising man; for he had twice made a voyage to England, and was so successful, and liked the country so much, that he always called himself an Englishman. Having accumulated a little property, or, as he expressed it, having become very rich, he gratified the darling wish of his heart by coming to Jerusalem, to die and be buried with his fathers in the Valley of Jehoshaphat. But this holy purpose in regard to his death and burial did not make him undervalue the importance of life, and the advantages of being a great man now. He told me that he was rich, very rich; that he was the richest, and in fact, the only rich Jew in Jerusalem. He took me through his house, and showed me his gold and silver ornaments, and talked of his money and the uses he made of it; that he lent to the Latin Convent on *interest*, without any security, whenever they wanted; but as for the Greeks—he laughed, laid his finger on his nose, and said he had in pledge jewels belonging to them of the value of more than 20,000 dollars. He had had his losses, too; and while we were enjoying the luxuries of his table, the leaven of his nature broke out, and he endeavoured to sell me a note for £1500, of the Lady Esther Stanhope, which he offered at a discount of fifty per cent.—a bargain which I declined, as being out of the line of my business.

I remember once the American fever came upon me in Athens; when, sitting among the ruins of the Acropolis, upon a broken column of the Parthenon, I speculated upon the growth of the city. I bought, in imagination, a piece of ground, and laid it out in lots, lithographed, and handsomely painted red, blue, and white, like the maps of Chicago, Dunkirk, and Hinsdale; built up the ancient harbour of the Piræus, and ran a railroad to the foot of the Acropolis; and I leaned my head upon my hand, and calculated the immense increase in value that must attend the building of the king's new palace, and the erection of a royal residence on the site of Plato's academy. I have since regretted that I did not "go in" for some up-town lots in Athens; but I have never regretted not having shaved the note of the Queen of the East, in the hands of the richest Jew in Jerusalem.

It was Saturday, the Jewish Sabbath. The command

to do no work on the Sabbath day is observed by every Jew, as strictly as when the commandment was given to his fathers; and to such an extent was it obeyed in the house of my friend, that it was not considered allowable to extinguish a lamp which had been lighted the night before, and was now burning in broad daylight over our table. This extremely strict observance of the law at first gave me some uneasiness about my dinner; but my host, with great self-complacency, relieved me from all apprehensions, by describing the admirable contrivance he had invented for reconciling appetite and duty—an oven, heated the night before to such a degree that the process of cooking was continued during the night, and the dishes were ready when wanted the next day. I must not forget the Jew's family, which consisted of a second wife, about sixteen, already the mother of two children, and his son and son's wife, the husband twelve, and the wife ten years old. The little gentleman was at the table, and behaved very well, except that his father had to check him in eating sweetmeats. The lady was playing on the floor with other children, and I did with her what I could not have done with a bigger man's wife—I took her on my knees and kissed her. Among the Jews, matches are made by the parents; and immediately upon the marriage, the wife is brought into the household of the husband. A young gentleman was tumbling about the floor who was engaged to the daughter of the chief rabbi. I did not ask the age of the lady, of course; but the gentleman bore the heavy burden of three years. He had not yet learned to whisper the story of his love to his blushing mistress, for, in fact, he could not talk at all; he was a great bawling boy, and cared much more for his bread and butter than a wife; but his prudent father had already provided him.

On the morning of the 21st I departed for Jaffa, the ancient Joppa. It was a bright and beautiful morning when I left the Bethlehem Gate; but before I had been an hour on my way, it began to rain, and continued nearly the whole day. About three hours from Jerusalem we came to the village of Abougos, the chief of the most powerful families of Fellahs in the Holy Land. Nearly all his life he had been more or less in arms against the government; and his name was known among all the Christians in the East as the robber of the pilgrims to the Holy Sepulchre. I had met and spoken with him outside of the walls of Jerusalem, and during the rain, as I approached his village, I determined to stop and throw myself upon his hospitality for the night; but the returning sunshine deceived me, and I passed on, admiring the appearance of his village, which had much the best of any I had seen in the Holy Land. About an hour afterwards I was repenting, under a merciless rain, that I had not fulfilled my purpose. Riding three hours longer, stopping from time to time under a rock or tree, I was ascending the last range of mountains; before me were the fertile plains of Sharon; and across the plain, still at a great distance, was Ramla, the ancient Arimathea, the city of "Joseph the counsellor, the good man, and just." To the right, bordering the sea, was the range of Mount Carmel; but the rain was pelting in my eyes so that I could see nothing of it. I had been eight hours on the back of one of the most stubborn mules that ever persisted in having their own way; toiling with all my might, with blows and kicks, but finding it impossible to make him move one step faster than he pleased; and when the tower, the mosque, and the minaret of Ramla, were before me, at the other side of a level plain, and an hour's smart riding would have carried me there, I was completely worn out with urging the obstinate brute; and with muttered threats of future vengeance, wound my clerk around me, and hauling my umbrella close down, and grinding my teeth, I tried to think myself resigned to my fate. A strong wind was driving the rain directly in my face, and my mule, my cursed mule, stopped moving when I stopped heating; and in the very hardest of the storm, when I would have rushed like a bird on the wing, turned off from the path, and fell quietly to brows-

ing on the grass. Afraid to disarrange my umbrella and cloak, I sat for a moment irresolute; but the brute turned his face round, and looked at me with such perfect nonchalance, that I could not stand it. I raised my club for a blow; the wind opened my cloak in front, puffing it out like a sail; caught under my umbrella, and turned it inside out; and the mule suddenly starting, under a deluge of rain, I found myself planted in the mud on the plains of Sharon. An hour afterwards I was drying my clothes in the house of our consular agent at Ramla. There was no fire-place in the room; but I was hovering over a brazier of burning charcoal. I spent that night and all the next day in Ramla, although a quarter of an hour would have been sufficient to see all that it contained, which was simply nothing more than is to be found in any other village. The consul gave me a dry coverlet; and while some of his friends came in to look at and welcome the stranger, I laid myself down upon the divan and went to sleep.

The next morning I was unable to move; the fatigue, and particularly the rain of the preceding day, had been too much for me, and I remained all the morning in an up-stairs room, with a high ceiling and a stone floor, lying on a rug in one corner, cold, desponding, and miserable. In the afternoon I went down into the large room, to talk with the consular agent. But a year before he had flourished in all the pomp and pride of office. The arms of our country were blazoned over his door, and the stars and stripes had protected his dwelling; but a change had come over him. The Viceroy of Syria had ordered the flags of the consuls to be taken down at Ramla, and forbidden any of his subjects to hold the office except in the seaport towns. I could not help thinking that he was perfectly right, as it was merely allowing them the benefit of a foreign protection, to save them and their families, with two or three janizaries, from their duties to himself; but I listened attentively to the complaints of the poor agent. His dignity had been touched, and his pride humbled in the eyes of his townsmen; for the governor had demanded the usual duty from his sons, and had sent his executive officers with the summary order, the duty or the bastinado. The agent owed his appointment to Commodore Patterson, and talked of him and Captain Nicholson as friends who would see justice done him if he could communicate with them. I was afterwards struck with a display of delicacy and a sense of propriety that I had not expected from him; for although he charged me with many messages to Commodore Patterson, he requested me not to mention his difficulties in the matter of the agency, as he had already made representations to the consul at Beyroot, who had laid them before Commodore Porter at Constantinople; and an application in another quarter would look like distrusting their ability, or their willingness to resent what he called an indignity offered to the American flag. Annoyed at seeing the women dodging by, with their faces covered, and always avoiding me, I told him, that being a Christian and holding an appointment under our government, he ought to conform to our customs, and treat his women more as companions; or, at least, to let them come into the same room, and sit at the same table with him. He listened, but could not see any reason in my proposition. He said it might do for us; for with us the wives always brought their husbands money (the ignorant, uninformed barbarian), but in Syria (he sighed as he said it) they never added a para to the riches of their lords.

The next morning I set out again for Jaffa. The road lies through a rich plain; and in three hours, passing a large detachment of Turkish soldiers encamped outside, and waiting a transport to carry them to Alexandria, I was entering the gate of the ancient city of Joppa. Believed to have existed before the deluge, the city where Noah dwelt and built his ark; whence Jonah embarked for Tarshish, when he was thrown overboard and swallowed by a whale; the port used by Solomon to receive timber from Tyro for the building of the temple, and by all the kings of Judah to

connect the city of Jerusalem with foreign people, Jaffa is now a small Turkish town on the shores of the Mediterranean, but on a little eminence projecting into the sea, and containing a population of from 10,000 to 15,000 Turks, Arabs, Jews, and Christians. It has a fine climate, and a fine country around it; and the orange gardens are the finest on the shores of the Mediterranean. Although the seaport of Jerusalem, its harbour has always been bad; and when I was there, the wreck of a Turkish man-of-war was lying on the beach; and that same night, there being a severe storm, the little Greek pilgrim vessels were considered in great danger.

There is nothing of interest in the modern city of Jaffa. Its history is connected with the past. The traveller must stand on the shore, and fill the little harbour with the ships of Tarshish, or imagine Noah entering the ark with his family, by whom the earth was to be repopled; or wander through the narrow streets and ask himself, Where is the house of Tabitha, whom Peter "raised from the dead?" or that of Simon the tanner, where Peter "tarried many days?" and he may feel a less holy, but hardly less powerful interest, in standing by the gate where, for many years, a large pyramid of skulls attested the desperate struggle of Napoleon; or, in walking through the chambers of the Greek convent, then used as an hospital for the French, and the monks will show him an apartment where, when all hearts were sinking within them for fear, he visited and touched the sick of the plague, restored the drooping courage of his soldiers, and almost raised the dying from their bed of death.

Besides the interest attached to this place by reason of its great antiquity, and the many important events of which it has been the scene, I remember it with much kindness on account of the American consular agent, and the cordial manner in which he received me. He was not at home when I arrived; but in a few moments he came in, and, taking both my hands in his, pointed to the American arms on the wall, ordered the stars and stripes to be hoisted on the top of his house, and, with all the extravagance of the East, told me that all he had was mine. I had a great mind to take him at his word, and begin by appropriating a beautiful emerald that I saw on his finger; but, for the present, I contented myself with asking merely for a dinner, which was soon prepared; and I sat down to dine in the ancient city of Joppa, with my country's arms before me, and my country's banner waving above.

The agent was an Armenian, and a strict observer of all the requisitions of his exacting creed; he was rich, and had no children; and, what I never before heard from the lips of man, he said that he was perfectly happy. I was the first American who had visited him since he had received his appointment, and it seemed as if he could not do enough for me. He had repaired and reconstructed the whole road from Jaffa to Jerusalem; and when I asked him what reward he promised himself for this, he answered that he had done it for God, the pilgrims, and his own honour. I remained with him that night, and would have gone early the next morning, but he would not part with me so soon. I dined with him again; and in the afternoon, escorted to the gate by two janizaries, each with a large silver-headed mace in his hand, I left, probably for ever, my Armenian friend and the ancient city of Joppa. I do not know when I parted from a man with more regret.\*

I slept that night at Ramla; and the next day, about four o'clock, in company with several hundred pilgrims, I was again entering the Bethlehem Gate. Notwithstanding the misfortune of my Armenian friend, the road from Jerusalem to Jaffa, a road travelled from the time when Jonas went thither to embark for Tarshish, is now a mere mule-path, on which I was several times obliged to stop and turn aside to let a loaded mule pass by.

I had seen every thing in Jerusalem that it was the duty of a traveller to see. My time was now my own, for idling, lounging, or strolling, in the luxurious consciousness of having nothing to do. In this humour I used to set forth from the convent, never knowing where I should go, or what I should do; and whenever I went out with the deliberate intention of doing nothing, I was always sure of finding enough to occupy me. My favourite amusement in the morning was to go out by St Stephen's Gate, and watch the pilgrims as they began their daily round of visits to the holy places. Frequently, if I saw a group that interested me, I followed them to the Garden of Gethsemane and the Mount of Olives; sometimes I stopped in the Valley of Jehoshaphat, and, sitting down on the grave of an Israelite, watched the Jewish pilgrims. One morning, I remember, Paul and I were together; and we saw a young girl kissing the tomb of Zachariah, and weeping as if her heart would break. Paul asked her rather roughly what she was crying about; and the poor girl, looking at him for a moment, burst into a flood of tears, and told him that she was weeping over the tomb of the blessed prophet.

But there are few things connected with my journeying in the Holy Land which I look back upon with a more quiet satisfaction than my often repeated and almost daily walk around the walls of Jerusalem. It was a walk of between three and four miles; and I always contrived, about half an hour before the gates were closed, to be sitting on a favourite tombstone near St Stephen's Gate. The great Turkish burying-ground is outside the wall, near this gate; and regularly, on a fine afternoon, towards sunset, the whole Turkish population, in all their gay and striking costumes, might be seen wandering among the tombs. Few things strike a traveller in the East more than this, and few are to us more inexplicable. We seldom go into a graveyard except to pay the last offices to a departed friend, and for years afterwards we never find ourselves in the same place again without a shade of melancholy coming over us. Not so in the East; to-day they bury a friend, to-morrow they plant flowers over his grave, and the next day, and the next, they tend and water them, and once-a-week, regularly, they sit by the grave. On every holiday it is a religious duty to go there; and as often as they walk out for health or pleasure, they habitually turn their footsteps to the burial-ground. To them the grave is not clothed with the same terrors. It is not so dark and gloomy as to us. They are firmer believers than we are, though, as we think, in a false and fatal creed; and to them there is a light beyond the grave, which we of a better faith can seldom see. It was a beautiful picture to behold the graveyard thronged with Turkish women, in their long white veils. It would, perhaps, be too poetical to look upon them all as mourners. Perhaps, indeed, it would not be too much to say, that of the immense multitude who, day after day, are seen flitting among the tombs, many a widowed fair one, over the tomb of a dead lord, is dreaming of a living lover.

But there was one whom I noticed every day; she was always sitting by the same stone, and I always noticed her as one of the first to come out, and one of the last to return. She was a young Sciote girl, mourning over the tomb of her young lord; and well she might, for he had been to her a friend and protector, and she had been his only bride. When her father's house was laid in ruins, and her grey-headed sire and her manly brothers were slain before her eyes, he had saved her from the bloody scimeter, or from a fate worse than death; and he had wooed her, not as a Turk and master, but as a lover. He had won her young heart; and she had forgotten her kindred and her country; he had died with his bloody scimeter in his hand, and she thought only of the dead when she stood beside his grave.

\* The town of Jaffa has since been destroyed by an earthquake; and of 15,000 inhabitants, 13,000 were buried in the ruins. Has my Armenian friend escaped?

## CHAPTER XXXI.

Desert of St John.—A Midnight Procession.—Road to Jericho.  
—A Community of Women.—A Navigator of the Dead Sea.—A  
Dance by Moonlight.—A rude Lodging.

In company with Mr Whiting, I started for the Desert of St John the Baptist. Passing the Pool of Gihon, where Saul was anointed king by Zadoc and Nathan, we came to the Convent of the Holy Cross, the great altar of the chapel being erected, as the monks pretend, over the spot where grew the tree from which the cross was made. Moving on among hills and valleys, on our right was a distant view of Ramah, the country of Samuel the seer; and before us, crowning the very top of a high hill, were the ruins of the palace and the burial-place of the warlike Maccabees. The Convent of St John is built on the spot where John the Baptist was born. There is no doubt of this, say the monks; for beneath the great altar of the church is a circular slab of marble, with an inscription almost effaced: "Hic natus est precursor Dei"—here the forerunner of the Lord was born. This convent is in a fine situation; a small Christian village is attached to it; the top commands a beautiful view of the mountains, cultivated in terraces; and directly in front is the great Valley of Turpentine, or Elah, the battle-ground of the Israelites and Philistines, of David and Goliath. Taking a Christian boy with us as guide, we entered the valley; and following the stream to its source, in about two hours we came to the place where, it is said, Saul and the men of Israel pitched by the valley of Elah, and set the battle in array against the Philistines. It was precisely the spot where the scene so graphically recorded in Scripture might have taken place. "And the Philistines stood on a mountain on the one side, and Israel stood on a mountain on the other side, and there was a valley between them." On each side of me was a mountain, and the brook was still running near from which the shepherd-boy gathered the five smooth stones. The boy who accompanied us told me that the precise stones had never yet been found, though the monks had often searched for them.

At the extreme end of the valley is the Desert of St John, where was heard, for the first time, the voice of one crying in the wilderness, "Prepare ye the way of the Lord; make his paths straight." Directly in front, at the top of the mountain bounding the valley, is an open door in the rock leading to the grotto in which the prophet lived. There is no appearance of a desert in this place, except solitude; and if it be merely a locality fixed upon by the monks, they could not have selected one more inappropriate. It is one of the prettiest and best cultivated spots in the Holy Land; and sitting in the door of the grotto, with an Armenian pilgrim by my side, and looking out upon the valley and the mountains, all around terraced and cultivated to the very summits, all still and beautiful, I thought I had never seen a place better qualified to inspire a pious, philosophic, and happy state of mind, than this Desert of St John. We returned by a different road, searching on our way for the pool where Philip baptised the eunuch of Queen Candace; but after losing ourselves once or twice, and fearing a threatening shower, we returned to the city unsuccessful.

At about ten o'clock that evening, the monks, under a guard of soldiers and a crowd of pilgrims, each with a candle in his hand, left St Stephen's Gate in solemn procession. With a loud chant they crossed the Valley of Jehoshaphat, wound around the foot of the Mount of Olives to Bethpage and Bethany, said mass in the tomb of Lazarus, and returning, prayed and chanted on the Mount of Olives and in the Garden of Gethsemane; and at about daylight the next morning returned to the convent.

For several days I had been preparing for a journey to the Dead Sea, but a mysterious influence seemed still to hang about the borders of that water; and now, when all the rest of the Holy Land was perfectly tran-

quil, the Fellahs were in commotion among the barren mountains around it. I had waited two or three days at the request of the governor; but hearing of nothing in particular to prevent me, I determined to set out. The Sicilian priest who had proposed to accompany me could not go; and at about eight o'clock I was sitting on my horse alone, outside St Stephen's Gate, waiting for Paul, who had gone to the governor for a letter which he had promised me to the aga of Jericho. Attracted by the uncommon beauty of the morning, half the population of Jerusalem had already gathered without the walls. Joining a party of pilgrims, I followed once more the path I had so often trodden across the Brook Kedron and the Valley of Jehoshaphat; and, parting with them at the foot of the Mount of Olives, I wound around its base, and fell into the road to Jericho and the Jordan. We must have passed Bethpage, though there is nothing to mark where it stood; and in about an hour we came to Bethany, now a ruined Arab village, though the monks still show the house of Martha and Mary, the tomb of Lazarus, and even the barren fig-tree which was cursed by our Lord. The tomb of Lazarus is a large excavation in the rock; and the sepulchral chamber is at the foot of a staircase of ten or twelve steps.

Not far from Bethany we came to a fountain enclosed with marble, and soon after to a valley, where, the monks say, our Saviour, in coming from beyond the Jordan, at the prayer of the sisters of Lazarus, reposed with the disciples. In about two hours we were among the mountains. The scene every moment became wilder and more rugged; and except in the wilderness of Sinai and among the wastes of Idumea, I never travelled so dreary a road as "in going down to Jericho." It is on this desolate route that our Saviour lays the scene of the parable of the good Samaritan; and nowhere could a more forcible illustration be given of the heartlessness of the priest and the Levite, in "passing by on the other side." Ascending for some distance by the precipitous side of a yawning chasm, where a false movement of my horse might have dashed me to atoms, from the top of the Mountains of Desolation I looked to the left upon a higher and still wilder and more dreary range; and, towering above all the rest in gloomy grandeur, its naked sides pierced with doors for the cells of hermits, was the mountain of our Saviour's fasting and temptation; before me were the plains of Jericho, the Valley of the Jordan, the Mountains of Arabia, and the Dead Sea. A high, square building, like a tower, marked the site of Jericho, and a small stream, running between two banks of sand, was the hallowed Jordan.

Descending the mountain, on our left, directly at the foot, were the remains of an aqueduct and other ruins, which, in all probability, were part of the ancient city of Jericho. The plain commences at the foot of the mountains; the land is fertile, and well watered with streams emptying into the Jordan, but for the most part wild and uncultivated. About half way across we passed the edge of a stagnant pool, nearly covering a Mussulman burying-ground; the tombstones were washed from their places, and here and there the ghastly skeletons were visible above the muddy water. In one place, crossing a stream, we met three Abyssinians, who had come from the remotest point in the interior of Africa where the name of Christian is known, to bathe in the sacred Jordan. Two or three times we were obstructed by brick fences, intended as ramparts to protect the inhabitants and their flocks against the incursions of wolves; and at about four o'clock we arrived at the ruined village of Jericho.

I have observed that travellers generally, when they arrive at any place of extraordinary interest, find the right glow of feeling coming over them precisely at the proper moment. I never had any difficulty in Italy; for there, in the useful guidebook of Madame Starke, beautifully interspersed with valuable information about hotels, post-horses, and the price of washing linen, the reader may find prepared for him an appropriate cata-

logue of sensations for almost every possible situation and object, from a walk in the Coliseum by moonlight to a puppet-show at San Carlino in Naples; but in a country like this, a man is thrown upon his own resources; and notwithstanding the interest attached to the name of Jericho, I found it a hard matter to feel duly excited.

Jericho was the first city in Canaan which fell into the hands of the Israelites. It was long the second city of Judea, and, according to the Jewish Talmud, contained twelve thousand priests. It had its hippodrome and amphitheatre, and in its royal palace Herod the Tetrarch died. But the curse of Joshua seems to rest upon it now: "Cursed be the man before the Lord who shall rebuild Jericho." It consists of fifty or sixty miserable Arab houses, the walls of which on three sides are of stones, piled up like the stone fences of our farmers, most of them not so high as a man's head, and the front and top either entirely open or covered with brush.

The old fortress in which I expected to sleep, I found entirely abandoned, and the apartments used as a shelter for sheep and goats. I expected to find there the aga, quietly smoking his pipe, and glad to receive and gossip with a stranger; but I had mounted to the top, and looked out upon the extensive plains of Jericho and the Valley of the Jordan, without meeting a single person; and it was not until I had gone out of the gate, and with the bride in my hand was walking back into the village, that I noticed the remarkable circumstance, so different from the usual course of matters in Arab villages, that no throng of idlers had gathered around me. In fact, I had passed through the village, gone to the fortress, and come back, without seeing a man; and soon found that there was not a male in the village above ten years old, except the aga, and one passing Arab. It had numbered sixty men, of whom Ibrahim Paeha had ordered a levy of twenty-four for his army. The miserable inhabitants had decided among themselves upon nineteen who could best be spared; and, unable to supply the rest, in a spirit of desperation had abandoned their village; and, taking with them all the boys above ten years old, fled to the mountains around the Dead Sea, where they were now in arms, ripe for rebellion, robbery, and murder.

I found myself very much at a loss; the aga was a stranger there, and knew nothing of the localities; and I could not find a boy old enough to conduct me to the Well of Elisha. Some of the women knew where it was, but they would not go with me, though I asked them in all courtesy; and, taking my direction from them, and fixing my eyes on the naked top of the mountain of our Saviour's temptation, in about half an hour I reached the miraculous fountain where, at the request of the men of Jericho, Elisha, "cast salt into the spring and healed the water." It is enclosed in a large marble basin, and several streams, constantly running from it, refresh and fertilise the plains of Jericho. Riding on a short distance farther, I came to an aqueduct and the ruins of a Greek convent, at the base of the "exceeding high mountain" from whose top the devil showed our Saviour all the kingdoms of the world. The naked sides of the mountain are studded with doors, opening to the cells of anchorites and hermits, who there turned their backs upon temptation, and, amid desolation and solitude, passed their days in penance and prayer.

It was dark when I returned to Jericho. Before going away, the aga had taken me to his hut, and wished me to pass the night with him; but as two horses had already taken their places before me, and the hut was perfectly open, having merely a roof of branches, and nothing at all in front, I had looked round and selected another for my lodging-place, chiefly from the circumstance of its having a small boat set up on its side before it, so as to form a front wall.

That boat told a melancholy tale. It was the only one that had ever floated on the Dead Sea. About eight months before, Mr Costigan, an Irish traveller, who had been some years in the East, had projected a most in-

teresting journey, and, most unhappily for himself and the interests of science, died almost in the moment of its successful accomplishment. He had purchased his boat at Beyroot, and, with a Maltese sailor for his servant, in spite of many difficulties and impediments from the Arabs, had carried it across the country on a dromedary, and launched it on the Sea of Galilee; he had explored this most interesting water, and entering the Jordan, followed it down until he narrowly escaped with his life among the rocks and rapids of that ancient but unknown river; and then constantly obstructed by the Arabs, even the governor of Damascus refusing him any facilities, with great difficulty he succeeded in bringing his boat by land to the Dead Sea. In the middle of July he had embarked with his servant to make the tour of the sea, and eight days afterwards the old woman in whose tent I lodged had found him lying on the shore alone, gasping for breath. She had him carried to her hut, where he lay till the Rev. Mr Nicolaissen, the English missionary at Jerusalem, came for him, and the second day after his arrival in Jerusalem he died. With his dying breath he bore the same testimony to the kindness of woman under the burning sun of Syria that our countryman Ledyard did in the wilds of Siberia; for while lying upon the shores of the Dead Sea, the Arabs gathered round him only to gaze, and would have left him to die there if this old woman had not prevailed upon two of her sons to carry him to her hut.

That boat was interesting to me for another reason. Nothing, not even the thought of visiting Petra and the land of Idumea, affected me so strangely as the idea of making the tour of this sea; and notwithstanding the miserable state of my health, shattered by my journey in the desert, as soon as I heard, after my arrival at Jerusalem, that there was a boat at Jericho, I began to think of taking advantage of it. If I had succeeded in this, I should consider my tour the most perfect and complete ever made by any oriental traveller. I had hunted up the oars, sail, &c.; but on my return from Jaffa I was compelled to abandon all thoughts of making the attempt. Still, when I saw the boat, all my ardour revived; and never, in my lonely journeyings in the East, did I wish so earnestly for the comfort and support of a friend. With a companion, or even with a servant, who would encourage and support me, in spite of my health I should certainly have undertaken it; but Paul was particularly averse to the attempt; the boat was barely large enough for two; and I was compelled to give up the thought.

That evening I saw at Jericho what I never saw before. It was a beautiful moonlight night, and all the women were out of doors singing and dancing. The dance was altogether indescribable; consisting not of wanton movements, like those of the dancing girls in Egypt, but merely in joining hands and moving round in a circle, keeping time to the music of their own voices. I had never seen so gay and joyous a scene among the women in the East; and though their fathers, and brothers, and husbands, and lovers, were away among the mountains, I did not feel disposed to judge them harshly. It was so rare, in that unhappy country, to see any thing like gaiety of heart, that if they had been dancing over the graves of their husbands, I should have been inclined to join them. And they did not shun us as the Moslem women generally do; they talked with us with their faces uncovered; and I remember a young Arab girl, not more than sixteen, who had a child in her arms, and who told me that its father had fled to the mountains; and she put the child in my arms while she joined in the dance. In fact, my situation began to be peculiar; the aga had gone off to look for some one who would accompany me to the Dead Sea; and among perhaps more than a hundred women, that night Paul, and I, and my muleteers, were the only men in Jericho. In justice to the poor Arab women, however, I would remove from them any imputation of want of feeling or hardness of heart; for I have no doubt the young girl who left her child in my arms loved its father

as warmly as if they were all clad in purple and fine raiment every day.

I would have been better satisfied, however, if that night they had ceased their merriment at an earlier hour; for long after I had lain down on my stony bed, their song and laugh prevented my sleeping; and when they had retired, other noises followed: the lowing of cattle, the bleating of sheep and goats, the stamping of horses, the crying of children, and the loud barking of the watch-dog; and, finally, the fierce assault of the voracious insects that always swarm in an Arab's hut, drove me from my bed and out of doors. The cool air refreshed and revived me, and I walked by the light of a splendid moon among the miserable huts of the village, hunted and barked at by the watching wolf-dog, and perhaps exciting the apprehensions of the unprotected women.

I leaned against a high fence of brush enclosing some of the huts, and mused upon the wonderful events of which this miserable place had been the scene, until my eyes began to close; when, opening a place among the bushes, I drew my cloak around me and crawled in, and soon fell fast asleep. Once during the night I was worried and almost dragged out of my burrowing-place by the dogs, but I kicked them away, and slept on. At daylight the aga was pulling me by the shoulder, armed to the teeth, and ready to escort me. I shook myself and my toilet was made; and before the laughers, and singers, and dancers of the previous night, had waked from their slumbers, we were mounted and on our way to the Jordan.

#### CHAPTER XXXII.

The River Jordan.—The Dead Sea.—Force of Example.—Buoyancy of the Dead Sea.—A Perilous Ascent.—A Navigator of the Dead Sea.—Story of the Voyage.—The Convent of Santa Saba.

Moving directly from the ruined village, we soon left the fertile plains of Jericho, and entered the barren valley of the Jordan. It was washed and torn by the mountain torrents, full of gullies and large sand-hills; and in about an hour and a half we were standing on the banks of the river, at the most hallowed spot on the margin of that sacred stream, where, 1800 years ago, John baptised the Redeemer of the world; and where, year after year, thousands of pilgrims throw themselves into the river, with the blind belief that, by bathing in its waters, they wash away their sins. As a pious pilgrim, it would have been my duty, perhaps, to do the same; but the reader will please remember that it was the last day of March; that I had slept in a bush; that my limbs were stiff; and that it was not yet six o'clock in the morning, and that I had not breakfasted. Sitting down, then, on the bank, I made my morning meal, and drank as devoutly of its water as any pilgrim who ever stood by Jordan.

I afterwards followed the river close along its bank till it emptied into the Dead Sea, and nowhere found any spot that, for beauty of scenery, could be compared with this consecrated bathing-place of the pilgrims. The bank here is about ten or twelve feet high; a clear, level table of land, covered with rich grass, and large bushes on the edge overhanging the river. Judging by the eye, the river is here about thirty paces broad; the current is very rapid, and the pilgrim, in bathing, is obliged to hold on by the bushes, in order to prevent himself being carried away. Here, it is said, the wild beast still has his haunt; and the traveller sometimes, when the river is rising, may realise the expression, "He shall come up like a lion out of the swelling of Jordan." Opposite, the bank is low, and the bushes grow down to the water's edge. Immediately below this, the river narrows to ten paces; and there is not another spot on the line of the Jordan which can attract the eye of the traveller. It is a small, broken, and muddy stream, running between banks of barren sand, without bloom or verdure; and if it were not for the associations connected with it, a man would turn from it as the most uninteresting of rivers. In one

place I saw an Arab wading across; and the river there, so far as I could judge, had not fallen more than two feet. I followed it as closely as the cracks and gullies would allow, cutting off none of the bends. For the last two or three miles it runs between perpendicular banks of sand, from five to ten feet high, and its pure waters are already corrupted by the pestiferous influence of the bituminous lake. On the left it stops even with the shore; but on the right the bank runs out to a low, sandy point, round which a quantity of driftwood is collected; and here, with a gentle ripple of its waters, the Jordan is lost in the Dead Sea.

I followed it almost to the very point, until my horse's feet sank above his fetlocks in the wet sand. It was the old opinion, and was counted among the wonders of the lake Asphaltites, that the river passed through without mingling with the waters of the lake; and Pococke says, "I thought I saw the stream of a different colour;" but Pococke did not follow the river down to the extreme point. I did; and could see most distinctly the very spot where the waters mingled. Instead of the river keeping its way through, its current was rather stopped at once by the denser water of the lake; and, in fact, for two or three miles above its mouth, the Jordan is impregnated with the salt and bituminous matter of the lake.

Almost at the moment of my turning from the Jordan to the Dead Sea, notwithstanding the long-credited accounts that no bird could fly over without dropping dead upon its surface, I saw a flock of gulls floating quietly on its bosom; and when I roused them with a stone, they flew down the lake, skimming its surface until they had carried themselves out of sight. From the point on which I stood, near its eastern shore, the sea was spread out before me, motionless as a lake of molten lead, bounded on either side by ranges of high and barren mountains, and on its southern extremity by the great desert valley of El Ghor; constantly receiving the waters of the Jordan, but, unlike other waters, sending no tribute to the sea. Pliny, Diodorus Siculus, and Josephus, describe it as more than sixty miles long; but Mr Banks and his companions, by observation from elevated heights, make it not more than thirty; and as the ancients were better acquainted with it than modern geographers, it has been supposed that the lake has contracted in its dimensions, and that part of the valley of El Ghor was once covered by its waters.

Moving on slowly from the point of the Jordan, the shores low and sandy, strewed with brush and driftwood, and rising in a slope to the sandy plain above, I rode along nearly the whole head of the lake with my horse's feet in the water, and twice picked up a large piece of bitumen, almost like common pitch, supposed to be thrown up from the bottom of the lake. The sand is not bright like that of an Atlantic or Mediterranean beach, but of a dirty, dark brown. The water is exceedingly clear and transparent, but its taste and smell are a compound of all that is bad.

It was now the last day of March, and even before we left the plains of the Jordan the sun had been intensely hot; without a branch or leaf to break its force, it poured upon the dreary waste around the Dead Sea with a scorching and withering heat. It was on this shore that the Knight of the Leopard encountered the Saracen Emir; and in the sandy plain above is the beautiful scene of the Diamond of the Desert, in the opening of Scott's Crusaders. The general features of the scenery along the northern shore of the Dead Sea are admirably described. The Diamond of the Desert is, of course, the creation of the author's fancy; and the only actual error is in placing the wilderness of Engaddi, which Scott has confounded with the mountains of Quarantania, but which is really half way down the borders of the sea.

It was two o'clock when my guards, having conducted me along the head of the sea, proposed returning to Jericho. I had already had some difficulty with them. Twice disappointed in my purposed exploration of this sea; once in my wish, conceived on the top of Mount

Hor, to strike it at its southern extremity, and coast along its borders; and then in the still more attractive project of exploring it in a boat. Instead of returning to Jericho, my desire was to go down the borders of the sea, and turn up among the mountains to the convent of Santa Saba. At Jerusalem I could not hire horses for this convent, because, as they said, it was a dangerous route; and I took them for Jericho, hoping in some way or other still to accomplish my object. By accident, an Arab from Santa Saba had come to Jericho during the night; and in the morning I told the aga and his companion that I would not have them as my escort at all, unless they would go with me to the convent. They at first objected, but afterwards promised to go as far as I wanted them; and now they again made objections. I thought it was merely to enhance the value of their services; but in a few moments they told me they would not go any farther; that the order of the governor was to protect me to the Dead Sea, and back to Jericho. The worst of it was, that my muleteers refused to go without the guard; and although we had a guide with us who told us there was no danger, though we had not met a single Arab since we left Jericho, and though we could see many miles down the lake, and plainly distinguish the wild track up the bare side of the mountain to the open country above, they were "afraid of the bad Arabs." I was determined, however, not to go back to Jericho. I had no idea of sleeping in the bushes again; and spurring my horse, I told Paul to follow me, and they might do as they pleased. The aga and his companion bade me farewell; and, dashing over the arid plain, were soon hidden from view by hillocks of sand. I continued along the shore; and after a few moments' consultation, my Arabs quietly followed me.

Since early in the morning, I had had the sea constantly before my eyes. While riding along the northern shore, the general aspect was very much the same; but as soon as I turned the head, and began to move along its side, the mountains every moment assumed a different aspect, although every where wild, rugged, and barren. At three o'clock we were approaching a place where the mountain rises precipitously from the lake, leaving no room for a passage at its foot; my eyes were fixed upon the lake, my thoughts upon its mysterious properties. The ancients believed that living bodies, and even heavy metals, would not sink in it; and Pliny and Strabo have written of its extraordinary buoyancy. Before I left Jerusalem, I had resolved not to bathe in it, on account of my health; and I had sustained my resolution during the whole of my day's ride along its shore; but, on the point of turning up among the mountains, I could resist no longer. My clothes seemed to come off of their own accord; and before Paul had time to ask me what I was going to do, I was floating on its waters. Paul and the Arabs followed; and after splashing about for a while, we lay like a parcel of corks upon its surface.

From my own experience, I can almost corroborate the most extravagant accounts of the ancients. I know, in reference to my own specific gravity, that in the Atlantic or Mediterranean I cannot float without some little movement of the hands; and even then my body is almost totally submerged; but here, when I threw myself upon my back, my body was half out of water. It was an exertion even for my lank Arabs to keep themselves under. When I struck out in swimming, it was exceedingly awkward; for my legs were constantly rising to the surface, and even above the water. I could have lain there and read with perfect ease. In fact, I could have slept, and it would have been a much easier bed than the bushes at Jericho. It was ludicrous to see one of the horses. As soon as his body touched the water, he was afloat, and turned over on his side; he struggled with all his force to preserve his equilibrium; but the moment he stopped moving, he turned over on his side again, and almost on his back, kicking his feet out of water, and snorting with terror. The worst of my bath was, after it was over, my skin was

covered with a thick, glutinous substance, which it required another ablution to get rid of; and after I had wiped myself dry, my body burnt and smarted as if I had been turned round before a roasting fire. My face and ears were encrusted with salt; my hairs stood out, "each particular hair on end;" and my eyes were irritated and inflamed, so that I felt the effects of it for several days. In spite of all this, however, revived and refreshed by my bath, I mounted my horse a new man.

Modern science has solved all the mystery about this water. It has been satisfactorily analysed, and its specific gravity ascertained to be 1.211, a degree of density unknown in any other, the specific gravity of fresh water being 1.000; and it has been found to hold in solution the following proportions of salt to 100 grains of water:—

|                            | Grains. |
|----------------------------|---------|
| Muriate of lime, - - -     | 3.920   |
| Muriate of magnesia, - - - | 10.246  |
| Muriate of soda, - - -     | 10.360  |
| Sulphate of lime, - - -    | 0.054   |
|                            | 24.580  |

Except the ruined city of Petra, I never felt so unwilling to leave any place. I was unsatisfied. I had a longing desire to explore every part of that unknown water; to spend days upon its surface; to coast along its shores; to sound its mysterious depths, and search for the ruins of the guilty cities. And why not? If we believe our Bible, that bituminous lake covers the once fertile vale of Siddim, and the ruins of Sodom and Gomorrah; and why may we not see them? The ruins of Thebes still cover for miles the banks of the Nile; the pyramids stand towering as when they were built, and no man knows their builders; and the traveller may still trace, by "the great river, the Euphrates," the ruins of the Tower of Babel. Besides, that water does not destroy; it preserves all that it touches; the wood that falls into it becomes petrified by its action; and I can see no good reason why it should hide for ever from man's eyes the monuments of that fearful anger which the crimes of the guilty had so righteously provoked.

Except to the summit of Mount Hor, I never had so desperate a climb as up the barren mountain on the borders of the Dead Sea. We had not found any water fit to drink since we left the Jordan, and turned up a little before we reached the place we had intended, the guide telling us that here we would find a spring. We were soon obliged to dismount; and even our sure-footed horses, trained as they were to climbing mountains, slipped, faltered, and completely failed. Our guide told us that he had never ascended with horses before; and, looking forward, the attempt seemed utterly impossible; but the noble animals climbed with the intelligence of men, holding on with their fore-feet as if they were hands, and the Arabs above pulling them by the mane, or pushing from below. One of them, in climbing an almost perpendicular height, fell over backward. I thought he was killed; and my Arabs, irritated by toil, thirst, and the danger to their horses, sprang upon the guide, and I believe would have killed him if Paul and I had not interfered. Taking off the enormous saddle, we all joined above and below, and hoisted and pushed him up almost bodily.

It was nearly dark when we reached the top of the mountain, and I sat down for a moment to take a last look at the Dead Sea. From this distance, its aspect fully justified its name. It was calm, motionless, and seemingly dead; there was no wave or ripple on its surface, nor was it hurrying on, like other waters, to pay its tribute to the ocean; the mountains around it were also dead; no trees or shrubs, not a blade of grass, grew on their naked sides; and, as in the days of Moses, "Brimstone and salt, it is not sown, nor beareth, nor any grass growth thereon."

One thing had especially attracted my attention in

ascending the mountain: on attaining a particular point, we had a clear view of the whole sea, and at the extreme end we saw distinctly what Paul and I both at once called an island. M. Seetzen, one of the earliest modern travellers who visited this sea, imagined that he had discovered a large island in the same direction; and though no one believed in its reality, I had then seen no satisfactory explanation of the appearance. I could not be deceived in what I saw. There never was any thing that looked more like an island, and I afterwards received an explanation which to me at least was perfectly satisfactory. It comes from one who ought to know, from the only man who ever made the tour of that sea, and lived to tell of it; and, relying upon the interesting nature of the subject, I make no apology for introducing it here.

When the unhappy Costigan was found by the Arabs on the shore of the Dead Sea, the spirit of the enterprising Irishman was fast fleeing away. He lived two days after he was carried to the convent at Jerusalem, but he never once referred to his unhappy voyage. He had long been a traveller in the East, and long preparing for this voyage; had read every book that treated of the mysterious water, and was thoroughly prepared with all the knowledge necessary for exploring it to advantage. Unfortunately for the interests of science, he had always been in the habit of trusting greatly to his memory; and, after his death, the missionaries in Jerusalem found no regular diary or journal, but merely brief notes written on the margins of books, so irregular and confused that they could make nothing of them; and, either from indifference, or because they had no confidence in him, they allowed Costigan's servant to go without asking him any questions. I took some pains to trace out this man; and afterwards, while lying at Beyroot, suffering from a malady which abruptly put an end to my travels in the East, Paul hunted him out and brought him to me. He was a little, dried-up Maltese sailor; had rowed around that sea without knowing why, except that he was paid for it; and what he told me bore the stamp of truth, for he did not seem to think that he had done any thing extraordinary. He knew as little about it as any man could know who had been over the same water; and yet, after all, perhaps he knew as much as any one else could learn. He seemed, however, to have observed the coast and the soundings with the eye of a sailor. They were eight days in accomplishing the whole tour of the lake, sleeping every night on shore except once, when, afraid of some suspicious Arabs whom they saw on the mountains, they slept on board, beyond the reach of gunshot from the land. He told me that they had moved in a zigzag direction, crossing and recrossing the lake several times; that every day they sounded, frequently with a line of 175 brachia (about six feet each); that they found the bottom rocky and of very unequal depth, sometimes ranging thirty, forty, eighty, twenty brachia, all within a few boats' length; that sometimes the lead brought up sand, like that of the mountains on each side; that they failed in finding bottom but once, and in that place there were large bubbles all around for thirty paces, rising probably from a spring; that in one place they found on the bank a hot sulphur spring; that at the southern extremity Mr Costigan looked for the River of Dogs, but did not find it; that in four different places they found ruins, and could clearly distinguish large hewn stones, which seemed to have been used for buildings; and in one place they saw ruins which Mr Costigan said were the ruins of Gomorrah. Now, I have no doubt that Mr Costigan talked with him as they went along,

\*I would suggest whether this irregularity does not tend to show the fallacy of the opinion, that the cities of the plain were destroyed by a volcanic eruption, and that the lake covers the crater of an extinct volcano. I have seen the craters of Vesuvius, Solfatara, Etna, and Monte Rosso, and all present the same form of a mountain excavated in the form of a cone, without any of the irregularities found in the bottom of this sea.

and told him what he told me; and that Mr Costigan had persuaded himself that he did see the ruins of the guilty city. He may have been deceived, and probably was; but it must have been the most intensely interesting illusion that ever any man had. But of the island, or what Paul and I had imagined to be such:—He said that they too had noticed it particularly; and when they came towards the southern extremity of the lake, found that it was an optical deception, caused by a tongue of high land, that put out for a long distance from the middle of the southern extremity; and, being much higher than the valley beyond it, intercepted the view in the manner we had both noticed. This tongue of land, he said, was composed of solid salt; tending to confirm the assertion of Strabo, to which I referred in my journey through Idumea, that in the great valley south of the Dead Sea there were formerly large cities built entirely of salt. The reader will take this for what it is worth; it is at least new, and it comes from the only man living who has explored the lake.

He told me some other particulars; that the boat, when empty, floated a palm higher out of the water than on the Mediterranean; that Costigan lay on the water, and picked a fowl, and tried to induce him to come in; that it was in the month of July, and from nine to five dreadfully hot, and every night a north wind blew, and the waves were worse than in the Gulf of Lyons; and in reference to their peculiar exposures, and the circumstances that hurried poor Costigan to his unhappy fate, he said that they had suffered exceedingly from the heat, the first five days Costigan taking his turn at the oars; that on the sixth day their water was exhausted, and Costigan gave out; that on the seventh day they were obliged to drink the water of the sea, and on the eighth they were near the head of the lake, and he himself exhausted, and unable any longer to pull an oar. There he made coffee from the water of the sea; and a favourable wind springing up, for the first time they hoisted their sail, and in a few hours reached the head of the lake; that, feeble as he was, he set off for Jericho, and, in the meantime, the unhappy Costigan was found by the Arabs on the shore a dying man, and, by the intercession of the old woman, carried to Jericho. I ought to add, that the next time he came to me, like Goose Gibbie, he had tried whether the money I gave him was good, and recollected a great many things he had forgotten before.

The reader cannot feel the same interest in that sea which I did, and therefore I will not detain him longer. In three hours, crossing a rich and fertile country, where flowers were blooming, and Arab shepherds were pasturing their flocks of sheep and goats, we had descended the bed of a ravine, where the Kedron passes from Jerusalem to the Dead Sea, at the foot of the mountains of Santa Saba. It was night when we arrived; and groping our way by the uncertain light of the moon, we arrived at the door of the convent, a lofty and gigantic structure, rising in stories or terraces, one above the other, against the sides of the mountain, to its very top; and then crowned with turrets, that from the base where I stood, seemed, like the tower at which the wickedness of man was confounded, striving to reach to heaven.

We "knocked and it was opened to us;" ascended two or three flights of steps, climbed up a ladder, crawled through a small door, only large enough to admit one at a time, and found ourselves in an antechamber, surrounded by more than 100 Greek pilgrims. A monk conducted us up two or three flights of steps to the chamber of the superior, where we took coffee. In a few moments we followed him again up two or three more flights of steps to a neat little room, with a divan and a large pile of coverlets.

I thought of the bush in which I had lodged the night before, spread out a few of the coverlets, crawled in among them, and in a few moments the Dead Sea, and the Holy Land, and every other land and sea, were nothing to me.

## CHAPTER XXXIII.

Convent of Santa Saba.—A strange Picture.—Celebration of Good Friday.—Palm Sunday.—A Struggle for Life.—The Grave of a Friend.—A Convert.—Burial of a Missionary.

I SLEPT till nine o'clock the next morning. The first thing I did after breakfast was to mount to the tower at the top of the convent. This is the largest Greek convent in the Holy Land; and I remarked that it was in a good state of repair, and that large and expensive improvements were then in progress. The tower commanded a view of the whole convent, built in terraces, in a sort of amphitheatre, in the side of the mountain. All around, particularly in the mountain opposite, were ranges of grottoes, formerly the residences of anchorites and hermits, admirably situated for cherishing pious thoughts, and leading a holy life. An old white-bearded monk, leaning on his staff, was toiling up its sides, leading a long procession of pilgrims, probably to some very holy place; and below me, apparently growing out of the rock, was a large palm-tree, planted, as they say, by Santa Saba himself in the fourth century. The cemetery is about half way down, in a vault under an open area. The flat stone that covered the entrance was fastened down with cement. The monk told me that the bodies of the dead were laid on stone benches, where lime was thrown over them; and as soon as decomposition had taken place, the bones were removed, and thrown upon a pile in another part of the cemetery.

The chapel, like all the other Greek chapels, was full of gaudy and ridiculous ornaments and paintings; and, among the latter, there was one that attracted the particular admiration and reverence of the pilgrims. At the top of the picture sat the father, surrounded by angels, and patriarchs, and good men; and on his right was a range of two-story houses, St Peter standing before them with the keys in his hand. Below the father was a large, powerful man, with a huge pair of scales in his hand, weighing sinners as they came up, and billeting on each the weight of his sins; below him were a number of naked figures, in a sitting posture, with their arms spread out, and their legs enclosed in long boxes extended horizontally. On the left a stream of fire was coming down from the father, and collecting in the mouth of a huge nondescript sea-monster, while in front stood a great half-naked figure, pitching in the sinners just as the fireman on board a steam-boat pitches in the long sticks of wood, and the damned were kicking about in the flames. On the right was Elias doing battle with Antichrist; and below was a representation of the last day, and the graves giving up their dead, in almost every conceivable variety of form and situation.

In another chapel, dedicated to John of Damascus, who formerly lived there, behind an iron grating in a grotto of the rock was a large pile of skulls and bones, the remains of 14,000 hermits who dwelt among the mountains, and were slain by the Turks.

The superior had been waiting some time to accompany me to Jerusalem. Will the reader believe it? This man had lived twenty years in the convent, and had never been to the Dead Sea! I was so disgusted with him that I rode on and left him; and following the Valley of the Kedron, meeting on the way hundreds of Greek pilgrims, in three hours I was again in Jerusalem.

The next night being Good Friday, the monks of the Latin Convent performed the ceremony of the crucifixion. The doors were open at an early hour for a short time, and then closed for the night, so that we were obliged to be there two or three hours before the ceremony began. Most of the pilgrims had prepared against the tediousness of waiting by bringing with them their beds, mats, and coverlets; and all around the floor of the church, men, women, and children, were taking an intermediate nap. The proceedings commenced in the chapel of the Latin Convent, where

priests, monks, pilgrims, Paul, and myself, all assembled, every one holding in his hand a long lighted candle. The superior, with his gold mitre and black velvet cloak trimmed with gold, my friend the Sicilian priest, and some other dignitaries of the church, were present, very richly dressed. On a large cross was the figure of a man, representing the Saviour, the crown of thorns on his head, nails in his hands and feet, blood trickling from them, and a gaping wound in his side. Before setting out on the procession, the lights were extinguished; and, in total darkness, a monk commenced a sermon in Italian. After this the candles were relighted, banners and crucifixes raised, and the procession moved round the church towards Calvary. Stopping at the Pillar of Flagellation, at the prison where they say Christ was confined, where the crown of thorns was put upon his head, where his raiment was divided, &c., and giving a chant, and an address by one of the monks at each place, they wound round the church until they came to the staircase leading to Calvary, and, leaving their shoes below, mounted barefoot to the place of crucifixion. Here they first went to an altar on the right, where, as they have it, Christ was nailed to the cross; and laying the figure down on the floor, although they had been bearing it aloft for more than two hours, they now went through the ceremony of nailing it; and returning to the adjoining altar, passed the foot of the cross through the marble floor, and with the bleeding figure upon it, set it up in the hole in the natural rock, according to the tradition, in the very spot where, 1800 years ago, Christ was crucified. At the foot of the cross a monk preached a sermon in Italian, warm, earnest, and impassioned; frequently turning round, and with both hands extended, apostrophising the bleeding figure above him. In spite of my scepticism and incredulity, and my contempt for monkish tricks, I could not behold this scene unmoved. Every attendant upon the crucifixion was represented; for the Governor of Jerusalem was present, with a smile of scorn upon his handsome features, and Turkish and Mussulman soldiers breaking the stillness of the scene with loud laughs of derision; and I could almost imagine that I heard the unbelieving Jews, with gibes and sneers, crying out, "If he be the King of Israel, let him come down from the cross!"

After the body had remained some time suspended, two friars, personating Joseph of Arimathea and Nicodemus, approached the foot of the cross; and one of them on the right, with a long pair of pincers, took the crown of thorns from the head, waved it around slowly with a theatrically mournful air, kissed it, and laid it down on a table before him; he then drew long spikes from the hands and feet, and moving them around, one by one, slowly as before, kissed them, and laid them also on the table. I never saw any thing more affecting than this representation, bad as it was, of the bloody drama of the crucifixion; and as the monks drew out the long nails from the hands and feet, even the scoffing Mussulmans stopped their laugh of derision. I stood by the table while they laid the body upon it, and wrapped it in a clean linen cloth; followed them when they carried it down from Calvary to the stone of unction; stood by the head of the stone while they washed and anointed it, and prepared it for burial, and followed it to the door of the sepulchre. It was now near two o'clock; the ceremony was ended, the Mussulman soldiers had retired, and Paul and I returned to the convent. We had no lamp; and as, in all the Turkish cities, every one is obliged to carry a lamp at night, and, in fact, it is necessary for his own security, we walked through the narrow streets of Jerusalem bearing the same long candles with which we had figured in the procession of the crucifixion.

On Sunday morning, being Easter, or Palm Sunday, I visited, for the last time, the Church of the Holy Sepulchre. It was more crowded than I had ever yet seen it. The courtyard literally swarmed with vendors of amulets, crucifixes, and holy ornaments; and within the church were tables of oranges, figs, dates, &c. The

Arab baker was walking about, with a large tray on his head, crying his bread; and in each of the altars was a sort of shop, in which Greeks were making and selling chaplets and wreaths of palm-leaves. It was altogether a lively image of the scene when Christ went into the temple, and "cast out them that bought and sold, and overthrew the tables of the money-changers." The ceremonies of the day were in commemoration of that on which our Saviour entered into Jerusalem, riding upon an ass, when the multitude followed him, strewing their garments and branches of palm-trees in his path, and crying, "Hosannah to the Son of David!" When I entered, the monks of the Latin Convent were celebrating grand mass before the holy sepulchre; and, in the mean time, the Greeks were getting ready for their turn. Their chapel was crowded, and all along the corridors the monks were arranging the people in procession, and distributing banners, for which the young Greeks were scrambling; and in one place a monk, with a standard in his hand, which had just been handed down from above, with his back against the wall, was knocking and kicking away a crowd of young Greeks, struggling to obtain it for the procession.

As soon as the Latins had finished, the Arab soldiers, whom I always found regular attendants at these scenes, as if they knew what was coming when the Greeks began, addressed them with loud shouts of "Yellah, yellah—come on, come on." A large banner was stationed at the door of the sepulchre; and the rush of the pilgrims to prostrate themselves before it, and to touch it with their palm-branches, was tremendous. A tall young Greek, with a large turban on his head, while his left hand supported the banner, was laying about him with his right as if he were really defending the sepulchre itself from the hands of the infidels. The procession advanced under a loud chant, preceded by a body of Turkish officers to clear the way; then came the priests, wearing their richest dresses, their mitres and caps richly ornamented with precious stones, and carrying aloft sacred banners, and one of them sprinkling holy water. Wherever he came, the rush was terrible; the Greeks became excited to a sort of phrensy in their eagerness to catch a drop; and one strapping fellow, bursting through the rear ranks, thrust his face over my shoulder, and bawled out "Papa, papa," in such an agonising voice, that the "papa" aimed at him a copious discharge, of which my face received the principal benefit. When the largest banner came round, the struggle to touch it with the palm-branches was inconceivable. A Turkish officer had, until this time, covered me with his body, and, by dint of shouting, kicking, and striking furiously about him, saved me till the procession passed by; but after this the rush became dreadful. I could feel my ribs yielding under the pressure, and was really alarmed when a sudden and mighty surge of the struggling mass hurried me into the stock in trade of a merchant of dates and oranges. Instead of picking up his goods, the fellow grappled at me; but I got out of his clutches as well as I could; and, setting up for myself, kicked, thumped, and scuffled until I made my way to the door; and that was my last visit to the Church of the Holy Sepulchre.

I had regretted that I could not stay for the great Greek jugglery, the drawing down fire from heaven, when every pilgrim considers himself bound to light his taper at the sacred flame; and those who light first are considered the most fortunate and the most favoured in the sight of God. I could imagine the wild and frantic struggling among more than 10,000 bigots and fanatics for the first rays of the heavenly light; but from what I saw that day, I felt that it would be putting life and limb in peril to be among them. Two years before, a horrible catastrophe had happened at the enactment of this ceremony. The air of the church had become so contaminated by the exhalations from the bodies of the thousands crowded within it, that respiration became difficult; terror, confusion, and a rush for the door, ensued; Ibrahim Pacha was carried out senseless, over the heads of the people, by a strong body of his soldiers;

and between 200 and 300 pilgrims were trodden down and trampled to death. Their bodies were laid out next morning in the court of the church; and so degraded is the character of these Christian pilgrims, that, as I was told by Mr Nicolaisen, the English missionary to the Jews, who was looking among them for a servant of his own, the friends and relatives of the slain carried them away in triumph, as martyrs in the cause of Christ.

My last visit in Jerusalem was to Mount Zion. I believe I have not mentioned that on this hill stands the tomb, or the supposed tomb, of David. It is covered by a mosque; the tomb is walled in, and, as the Arab door-keeper told me, even the eyes of the pacha are not permitted to look within the holy place. Here, too, is the conaeulum, or chamber where our Saviour ate his last supper with his disciples; in the Armenian chapel is the real stone that was rolled from the door of the sepulchre; and here also is the house of Caiaphas, the high-priest, with a tree marking the spot where the cock crew when Peter denied his master.

But there was one spot on Mount Zion far more interesting to me than all these, or even than anything in Jerusalem. It was the grave of my early friend, whom I had tracked in his wanderings from the Cataracts of the Nile, through the wilderness of Sinai, to his last resting-place in Jerusalem. Years had rolled away since I bade him farewell in the streets of our native city. I had heard of him in the gay circles of Paris as about to wed with one of the proudest names in France; again, as a wanderer in the East, and then as dead in Palestine. But a few short years had passed away, and what changes! My old school-mates, the companions of my youth and opening manhood, where were they? Gone, scattered, dispersed, and dead; one of them was sleeping in the cold earth under my feet. He had left his home, and become a wanderer in strange lands, and had come to the Holy Land to die, and I was now bending over his grave. Where were the friends that should have gathered around him in the awful hour of death? Who closed his dying eyes? Who received his parting words for his friends at home? Who buried him on Mount Zion? Once I had been present there at a scene which almost made me weep; the burial of an Armenian pilgrim. He was brought for burial in the clothes in which he had died; the grave was too small, and had to be enlarged; the priest stood at the head of the grave under a heavy shower of rain, and, as he offered me his snuff-box, grumbled at being obliged to wait; and when the grave was enlarged, and the body thrown in, and the wet dirt cast upon it, he mumbled a short prayer, and then all hurried away. And this was by the grave of my friend; and I could not but ask myself who had buried him, and who had mourned over his grave. The inscription on his tombstone afforded but vague answers to my questions, and they were of a painful character. It ran thus:—

D. O. M.  
Hic jacet  
B\*\*\*\*\* ex America.

Regionibus  
Lugduni Gallie: Consul Hierosolomis tactus intrinsecus sponte  
Erroribus Lutheri et Calvinii abjectis,  
Catholicam religionem professus svnanche correptus  
E vita decessit IV. nonas Augusti, MDCCCXXX., ætatis sue  
XXV.  
Amici merentes postere  
Orate pro eo.

He had died at the convent, and died alone. His travelling companion had accidentally remained at Jaffa, had not heard of his sickness, and did not arrive in Jerusalem until poor B— was in his grave. It was necessary to be wary in my inquiries; for the Catholics here are ever on the watch for souls, and with great ostentation had blazoned his conversion upon his tomb. The first time I inquired about him, a young monk told me that he remembered him well as on the day of his arrival, a fine, handsome young man, full of health and spirit, and that he immediately commenced talking about religion, and three days afterwards they said

mass, and took the sacrament together in the chapel of the convent. He told me the story so glibly, that I was confident of its falsity, even without referring to its improbability. I had known B—— well. I knew that, like most young men with us, though entertaining the deepest respect and reverence for holy things, in the pride of youth and health he had lived as if there was no grave; and I could imagine that, stretched upon his bed of death in the dreary cell of the convent, with "no eye to pity and no arm to save," surrounded by Catholic monks, and probably enfeebled in mind by disease, he had, perhaps, laid hold of the only hope of salvation offered him; and when I stood over his grave, and thought of the many thorns in his pillow in that awful hour—the distracting thoughts of home, of the mother whose name had been the last on his lips; the shuddering consciousness that, if he died a Protestant, his bones would be denied the rites of burial, I pitied, I grieved for, but I could not blame him. But when suspicion was aroused by the manner of the monk, I resolved to inquire further; and if his tale should prove untrue, to tear with my own hands the libellous stone from my friend's grave, and hurl it down Mount Zion. I afterwards saw the monk who had shrived him, and was told that the young man with whom I had conversed was a prater and a fool; that he himself had never heard B—— speak of religion until after his return from the Dead Sea with the hand of death upon him; that he had administered the sacrament to him but three days before his death, when all hope of life was past, and that even yet it might be a question whether he did really renounce his faith, for the solemn abjuration was made in a language he but imperfectly understood; and he never spoke afterwards, except, in the wildness of delirium, to murmur the name of "mother."

I have said that in his dying moments his feelings were harrowed by the thought that his body would be denied a Christian burial. Mr Whiting, who accompanied me on my first visit to his grave, told me that the Catholics would not have allowed him a resting place in consecrated ground; and, leading me a short distance to the grave of a friend and fellow missionary who had died since he had been at Jerusalem, described to me what he had seen of the unchristian spirit of the Christians of the holy city. Refused by the Latins, the friends of Dr Dodge had asked permission of the Greeks to lay his body for a little while in their burying-ground; and, negotiating with the dragoman of the convent, they thought that permission had been granted; but while they were in the act of performing the funeral service, a messenger came in to tell them that the grave had been filled up. They protracted the service till the delay excited the attention of his unhappy widow, and they were obliged to tell her that they had no place where they could lay the head of her young husband. A reluctant permission was at length granted, and they buried him by the light of torches; and although there had been no graves in that part of the ground before, the Greeks had buried all around, to prevent any application for permission to lay by his side the body of another heretic.

#### CHAPTER XXXIV.

Pilgrimage to the Jordan.—Pilgrim's Certificate.—The Tomb of Samuel.—Departure from Jerusalem.—Last View of the Dead Sea.—Village of Einbroot.—Departure from Judea.—Mounts Gerizim and Ebal.—An Antique Manuscript.—"Paas" in Samaria.

THE next day I left Jerusalem; but before leaving it, I was witness to another striking scene, which I shall never forget; the departure of the pilgrims, fifteen or twenty thousand in number, for the Jordan. At an early hour I was on horseback, outside St Stephen's Gate. It was such a morning as that on which I started for the Dead Sea, clear, bright, and beautiful; the streets of the city were deserted, and the whole popu-

lation were outside the walls, sitting under the shadow of the temple, among the tombs of the Turkish burying-ground; the women in their long white dresses, with their faces covered, and the men in large flowing robes, of gay and varied colours, and turbans of every fashion, many of them green, the proud token of the pilgrimage to Mecca, with pipes, and swords, and glittering arms; the whole Valley of Jehoshaphat was filled with moving beings, in every variety of gay apparel, as if the great day of resurrection had already come, and the tenants of the dreary tombs had burst the fetters of the grave, and come forth into new life and beauty.

I had received an invitation from the governor to ride in his suite; and while waiting for him at the gate, the terrible Abougos, with his retainers, came out and beckoned me to join him. I followed him over the Brook Kedron and the Valley of Jehoshaphat to the Garden of Gethsemane, where I stopped, and, giving my horse to an Arab boy, I stepped over the low fence, and, seating myself on the jutting root of the tree marked by the knives of pilgrims as that under which our Saviour was betrayed, looking over the heads of the Turkish women seated on the fence below, I saw the whole procession streaming from the gate, crossing the Valley of Jehoshaphat, and filing along the foot of the garden. They were on foot and on horseback, on donkeys, mules, dromedaries, and camels; and here and there were well-equipped caravans, with tents and provisions for the monks of the different convents. It would be impossible to give any idea of this strange and extraordinary procession: here might be seen a woman on horseback, with a child on each arm; there a large pannier on each side of a mule, with a man in one and a woman in the other; or a large frame on the high back of a camel, like a diminutive ark, carrying a whole family, with all their quilts, coverlets, cooking utensils, &c. Among them, riding alone on a raw-boned horse, was a beggarly Italian, in a worn and shabby European dress, with a fowling-piece and a game-bag, and every body made way for him; and there was a general laugh wherever he came. And now a body of Turkish horsemen, with drawn scimeters in their hands, rushed out of the gate, dashed down the valley, and up the sides of the mountains at full gallop, clearing the way for the governor; and then came the governor himself, under a salute from the fortress, on a horse of the best blood of Arabia, riding as if he were part of the noble animal, preceded by the music of the Turkish drum, and bowing with a nobility and dignity of manner known only in the East, and which I marked the more particularly, as he stopped opposite to me and beckoned to me to join him. Then came the pilgrims again, and I sat there till the last had gone by. Galloping back to the gate, I turned to look at them for the last time, a living, moving mass of thousands, thousands of miles from their homes, bound for the sacred Jordan, and strong in the faith that, bathing in its hallowed waters, they should wash away their sins.

In a few moments I was at the convent; and, sending Paul before me to the Damascus Gate, I went to take my leave of the superior. He told me that, though I was an American (the only Americans he had seen were missionaries, and he did not like them), he liked me; and bidding me a kind and affectionate farewell, he put into my hands a pilgrim's certificate, which follows in these words.—

#### FR. FRANCISCUS XAVERIUS A MELITA,

Ordinis minorum regularis observantiae S. P. N. Francisci; custodia melitensis lector theologus; ex-definito; sacrae congregationis propagandae fidei responsalis; missionum Aegypti et Cyprae praefectus; in partibus orientis commissarius apostolicus; sacri Montis Sion, et sanctissimi sepulchri D. N. Jesu Christi guardianus; totius Terrae Sanctae custos, visitator, et humilis in domino servus:

Illustrissimo Domino \*\*\*\*\* Americo libenter hoc praesens testimonium damus, et omnibus, ac singulis hoc praesentes nostras litteras lecturis, vel inspecturis notum, fidemque

facimus, Laudatum Illustrissimum Dominum Jerusalem pervenisse, et omnia principaliora loca, que in tota Palestina visitari solent, presertim Ssm. Sepulchrum Dom. N. Jesu Christi, Calvarie Montem, Præsepium Betlehemiticum, etc., visitasse. Et quod ita sit, attestacionem manu nostra subscribimus, et sigillo majori officii nostri munitam expediti mandamus.

Datis Jerusalem, ex hoc Venerabili Conventu Sancti Salvatoris, die 3 Aprilis, Anno Domini 18 trigesimo-sexto.

Fr. Franciscus Xavierus a Melita, Custos Terræ Sanctæ.

SEAL.

De Mandato Rendimi in Xpto Patris,

FR. PERPETUUS A SOLERIO,  
Secretarius Terræ Sanctæ.

Which, being interpreted, is as follows:—

BROTHER FRANCIS XAVIER, OF MALTA,

Brother Francis Xavier, of Malta, of the order of monks of the regular rule of our Father Saint Francis; theological reader of the order of Malta; expounder, missionary of the sacred congregation for propagating the faith; prefect of the missions of Egypt and Cyprus; apostolical commissary in the Eastern world; guardian of the holy Mount Zion, and of the most holy Sepulchre of our Lord Jesus Christ; keeper and visitor of all the Holy Land, and humble servant in the Lord:

To the most illustrious Lord \*\*\*\* \* \*\*\*\*\*, an American, we give this present testimonial; and to all and every one who shall read or inspect these our present letters, we do make known and certify that this celebrated and most illustrious lord has come through Jerusalem, and has visited all the principal places which are accustomed to be visited in all Palestine, especially the most Holy Sepulchre of our Lord Jesus Christ, the Mount of Calvary, the Convent at Bethlehem, &c.; and that it is so we subscribe this attestation with our hand, and cause it to be put forth fortified by the great seal of our office.

Given at Jerusalem, from this venerable convent of the Holy Saviour, on the 3d day of April, in the year of our Lord one thousand eight hundred and thirty six.

Brother Francis Xavier, of Malta, Guardian of the Holy Land.

SEAL.

Given by command, in the private office of the Father,

FRANCIS A SOLERIO,  
Perpetual Secretary of the Holy Land.

Whereby the reader will see, that whatever may be his fate hereafter, a pilgrimage to the holy city gives a man temporal honours, and has transformed a republican citizen of America into an "illustrissimus dominus."

With this evidence of my pilgrim character, I mounted my horse for the last time at the door of the convent. I lost my way in going to the Damascus Gate,

but a friendly Jew conducted me to it; a Jew was the first to welcome me to the Holy Land, and a Jew was the last to speed me on my way from the holy city of Jerusalem. Paul was waiting for me; and for half a mile we passed mounds of ruins, the walls of the old city having extended some distance beyond the Damascus Gate. In about three quarters of an hour, a little to the right, we came to what are called the Tombs of the Judges, excavations in the rock, one of them full of water. I have no satisfaction in the recollection of these tombs, for there I lost my old companion, the terror of evil dogs, my Nubian elub; which, since I bought it in Nubia, had seldom been out of my hand. In about three hours we were mounting Djebel Samyel, the highest mountain about Jerusalem, crowned with the ruins of Ramah, the birthplace and tomb of Samuel the seer. A few Arab huts are around the ruins; and a ruined mosque, the minaret of which has fallen, is the most prominent building on the mountain. We entered the mosque; at the farther end was a door locked, but with a key in it. I turned the key, and entered a dark chamber. By the light from the door I could see at the far end a dark, sombre-looking object, and groped my way to the tomb of Samuel; I kept my hands on it, and walked around it; and hearing some of the villagers at the door, I tore off a piece of the pall, as I had done from the tomb of Aaron, and hurried out. I stopped for a moment on the top of the mountain, and, looking back towards the holy city, saw for the last time the Mosque of Omar rising proudly over the ruins of the Temple of Solomon, the Church of the Holy Sepulchre, the walls of Jerusalem, and the Dead Sea. My first view of this latter had been from the tomb of Aaron; and I considered it a not uninteresting coincidence that I was now looking upon it for the last time from the tomb of Samuel.

In about an hour, riding over a rough road, we came to the village of Beer, supposed to be the Beer to which Jotham fled "for fear of his brother Abimelech." A ruined khan was at the entrance of the village, and near it a large fountain, at which the women were washing. About an hour beyond this, to the right, on a little elevation, are the ruins of Bethel, the ancient Bethel. It was here that the bears came out and tore in pieces the children that mocked the bald-headed prophet Elisha, and it was here that Jacob took "the stones of the place for his pillow, and dreamed, and beheld a ladder reaching to heaven, and the angels of God ascending and descending thereon." Though surrounded by stony mountains, it was prettily situated; I rode among the ruins without dismounting. The place was solitary and deserted, and not a human being appeared to dwell in it. At one end were the ruins of a church, and near it was a large fountain in a stone reservoir; a single cow was drinking at the fountain, and at the moment a boy was driving past a flock of goats to his village home in the mountains. He was a Christian, and called me Christian, and hadji or pilgrim, and gave me a wild flower, which he plucked from under my horse's feet. It was a beautiful afternoon, and all was so still and quiet that I felt strongly tempted to lie down and sleep where Jacob did; but I had given away my tent and camp equipage, and I reflected that while I was sure of the patriarch's pillow of stone, I had but little prospect of being blessed with the promise that softened it, "that the land on which he lay should be given to him and his seed, and that in him all the families of the earth should be blessed."

In about an hour we came to the village of Einbroot, prettily situated on an eminence, and commanding on all sides a view of fertile and well-cultivated valleys. We were looking for Einbroot; and as the village to which we had come lay a little off the road, we were not sure it was the place we wanted. A woman told us it was not, a man assured us that the sheik was not at home, and there seemed clearly a disposition to send us on farther; and this determined us to stop. We rode up to the village, and inquired for the sheik; the villagers gave us evasive answers, one saying that he

was away, and another that he was sick; but a little boy, pointing with his finger, told us that he was there, praying; and looking up, we saw him on the top of the house, on his knees, praying with all his might, and occasionally looking over his shoulder at us. By his not coming to welcome me, I saw that he did not wish me to stay; and after my scenes with the Bedouins in the desert, having a comparative contempt for dwellers in houses, I dismounted and sat down, determined to see who would get tired first. In the mean time the villagers gathered around as spectators of our contest, and the sheik, as if ashamed of himself, at length finished his prayers, and came down to receive me. He told me that he had no place for us, and showed me to a large room, fifty or sixty feet square, which seemed to be the common resort and sleeping-place of all who had no particular home. After the comforts of the convent at Jerusalem, I did not like the look of things in the beginning of my journey; but consoling myself with the reflection that it was only for one night, I spread my mat in a corner, and had just time to stroll around the village before dark.

The houses were built of rough stone, a single story in height, with mud roofs, many of them overgrown with grass, and now presenting, towards sundown, the singularly picturesque spectacle, which I had often noticed in Syria, of the inhabitants sitting out upon the terraces and roofs of their houses, or, perhaps, the still more striking picture of a single old white-bearded, patriarchal figure, sitting alone upon his housetop. One of these venerable personages called me up to his side; and I was well rewarded for my trouble, and could fully appreciate the satisfaction with which the old man, day after day, looked out upon the beautiful and well-cultivated valley, the terraces, and the smiling villages on the mountain side.

Several of the villagers were following us, and among them a fine old man, the brother of the sheik, and formerly sheik himself. He told me that, since the stormy times of Mohammed Ali, he had resigned the sheikdom, and comforted himself for the loss of station in the arms of a young wife; and before we parted we were on such good terms that he told me the reason of their unwillingness to receive us; namely, that they thought we were officers of Mohammed Ali, sent to spy out their condition, and ascertain the number of their men able to bear arms; but satisfied that we were merely travellers, and warned by my honest disclaimer of the imputed character, he invited me to his house, and both he, and the sheik, and all the villagers, seemed striving now to atone for the churlishness of their first reception.

The old man was as kind as a man could be; in fact, his kindness oppressed me; for having but one room in his house, he sent both his wives out of doors to sleep at a neighbour's. In vain I told him not to disarrange himself on my account; to make no stranger of me; to let them stay; and that it was nothing to me if the whole harem of the sultan was there; he was positive and decided. I catechised him about his wives, and he said that he had been a poor man all his life, and could never afford to keep more than one till lately; and now the companion of his youth and the sharer of his poverty was thrust away into a corner, while with all simplicity and honesty he showed me the best place in the house appropriated to his young bride. He talked as if it had been the hardest thing in the world that he had been obliged to content himself so long with his first wife. Thus it seems, that here, as with us, extravagance comes with wealth; and whereas with us, when a man grows rich he adds another pair of horses to his establishment, so the honest Mussulman indulges himself with another helpmate.

Two Turks and an Arab slept in the room with us; and before going to bed, that is, before lying down on the mud floor, and the first thing in the morning, they turned their faces to the tomb of the Prophet, knelt down and prayed. In the evening one of them had complained of a headache, and another, standing over

him and pressing his temples with the palms of his hands, repeated a verse of the Koran, and the headache went away. I asked him whether that was good for a sore throat; he told me that it was, but, after giving me a verse or two, said that his remedy could only have full effect upon true believers.

Early in the morning I set off, my host and the sheik and half the village gathering around me to bid me farewell, and invoke blessings upon me. I did not know the extent of the sacrifice my host had made for me until at the moment of parting, when I got a glimpse of his young wife.

We were now entering the region of Samaria, and, though the mountains were yet stony, a beautiful country was opening before us. We soon came into a smiling valley full of large olive-trees, and rode for some time in a pleasant shade. Every where we were meeting streams of pure water, tempting us perpetually to dismount after the sandy desert through which we had been so long travelling. We passed, too, several villages, among which I remember was the village of Cowara, beautifully situated on the side of the mountain, overlooking a fertile valley, and all the women of the village were in the field picking the tares from the grain.

I was now about entering one of the most interesting countries in the Holy Land, consecrated by the presence of our Saviour in the body, and by the exercise of his divine and miraculous powers. The Bible was again in my hand, and I read there that Jesus Christ had left "Judea and departed into Galilee; that he must needs pass through Samaria, and that he came to a city of Samaria called Sychar, near to the parcel of ground that Jacob gave to his son Joseph;" And "Jacob's well was there, and Jesus, being weary with his journey, sat down on the well, and it was about the sixth hour. And there cometh a woman of Samaria to draw water; and Jesus saith unto her, Give me to drink." It is with no irreverent feeling that I draw the parallel, but I was following in the very footsteps of the Saviour; I too had left "Judea, and had departed into Galilee;" I too "must needs go through Samaria;" and I too was now coming to the city of Samaria called Sychar, and, before entering the city, I would fain sit down on the well of Jacob, where our Saviour talked with the Samaritan woman.

At Cowara I took a guide to conduct me to this well. In about two hours we were winding along the side of Mount Gerizim, whose summit was covered with the white dome of the tomb of an Arab saint; and passing one well on the declivity of the mountain, going down to the valley at its base, we came to Jacob's well, or the Beer Samarea of the Arabs. I knew that there was a difference of opinion as to the precise site of this interesting monument; but when I found myself at the mouth of this well, I had no wish to look farther; I could feel and realise the whole scene; I could see our Saviour coming out from Judea, and travelling along this valley; I could see him, wearied with his journey, sitting down on this well to rest, and the Samaritan woman, as I saw them at every town in the Holy Land, coming out for water. I could imagine his looking up to Mount Gerizim, and predicting the ruin of the temple, and telling her that the hour was coming when neither on that mountain nor yet in Jerusalem would she worship the God of her fathers. A large column lay across the top of the well, and the mouth was filled up with huge stones. I could see the water through the crevices, but, even with the assistance of Paul and the Arabs, found it impossible to remove them. I plucked a wild flower growing in the mouth of the well, and passed on.

The ground which I was now treading is supposed to be the "parcel of ground" which Jacob bought of the sons of Hamor, the father of Shechem, for a hundred pieces of silver, and gave to his son Joseph. Turning the point of the mountain, we came to a rich valley, lying between the mountains of Gerizim and Ebal, Crossing this valley, on the sides of the mountains of Ebal is a long range of grottoes and tombs, and a little

before coming to them, in a large white building like a sheik's tomb, is the sepulchre of Joseph, as it is written, "the bones also of Joseph, which the children of Israel brought up with them out of Egypt, buried they in Shechem." I dismounted and entered the building, and it is not an uninteresting fact that I found there a white-bearded Israelite, kneeling at the tomb of the patriarch, and teaching a rosy-cheeked boy (his descendant of the fourth generation) the beautiful story of Joseph and his brethren.

It was late in the afternoon when I was moving up the valley of Naplous. The mountains of Gerizim and Ebal, the mountains of blessings and curses, were towering like lofty walls on either side of me; Mount Gerizim fertile, and Mount Ebal barren, as when God commanded Joshua to set up the stones in Mount Ebal, and pronounced on Mount Gerizim blessings upon the children of Israel, "if they would hearken diligently unto the voice of the Lord, to observe and do all his commandments,"\* and on Ebal the withering curses of disobedience. A beautiful stream, in two or three places filling large reservoirs, was running through the valley, and a shepherd sat on its bank, playing a reed pipe, with his flock feeding quietly around him. The shades of evening were gathering fast as I approached the town of Naplous, the Shechem or Sychem of the Old Testament, and the Sychar of the New. More than a dozen lepers were sitting outside the gate, their faces shining, pimpled, and bloated, covered with sores and pustules, their nostrils open and filled with ulcers, and their red eyes fixed and staring; with swollen feet they dragged their disgusting bodies towards me, and with hoarse voices extended their deformed and hideous hands for charity.

We rode up the principal street; and at the door of the palace I met the governor just mounting his horse, with a large retinue of officers and slaves around him. We exchanged our greetings on horseback. I showed him my firman, and he sent a janizary to conduct me to the house of a Samaritan, a writer to the government, where I was received, fed, and lodged, better than in any other place in the Holy Land, always excepting the abodes of those suffering martyrs, the Terra Santa monks.

I had just time to visit the Samaritan synagogue. Leaving my shoes at the door, with naked feet I entered a small room, about fifteen feet square, with nothing striking or interesting about it except what the Samaritans say is the oldest manuscript in the world, a copy of the Pentateuch, written by Abishua, the grandson of Aaron, three years after the death of Moses, or about 3500 years ago. The priest was a man of forty-five, and gave me but a poor idea of the character of the Samaritans, for he refused to show me the sacred scroll unless I would pay him first. He then brought down an old manuscript, which, very much to his astonishment, I told him was not the genuine record; giving him very plainly to understand that I was not to be bamboozled in the matter. I had been advised of this trick by the English clergyman whom I met in Jerusalem; and the priest, laughing at my detection of the cheat, while some of his hopeful flock who had followed me joined in the laugh, brought down the other, preserved in a tin case. It was written in some character I did not understand, said to be the Samaritan, tattered and worn, and bearing the marks of extreme age; and though I knew nothing about it, I admitted it to be the genuine manuscript; and they all laughed when I told the priest what a rogue he was for trying to deceive me; and this priest they believe to be of the tribe of Levi, of the seed of Aaron. If I had left Naplous then, I should probably have repeated the words that our Saviour applied to them in his day, "No good thing can come out of Samaria;" but I spent a long evening, and had an interesting conversation with my host and his brother, and in their kindness, sincerity, and honesty, forgot the petty duplicity of the Levite.

Much curiosity has existed in Europe among the

\* Deuteronomy, xxviii. 1.

learned with regard to this singular people, and several of the most eminent men of their day, in London and Paris, have had correspondence with them, but without any satisfactory result. The descendants of the Israelites who remained and were not carried into captivity, on the rebuilding of the second temple were denied the privilege of sharing the labour and expense of its reconstruction at Jerusalem; and in mortification and revenge, they built a temple on Mount Gerizim, and ever since a deadly hatred has existed between their descendants the Samaritans and the Jews. Gibbon, speaking of them in the time of Justinian, says, "The Samaritans of Palestine were a motley race, an ambiguous sect, rejected as Jews by the pagans, by the Jews as schismatics, and by the Christians as idolaters. The abomination of the cross had already been planted on their holy mount of Gerizim, but the persecution of Justinian offered only the alternative of baptism or rebellion. They chose the latter; under the standard of a desperate leader, they rose in arms and retaliated their wrongs on the lives, the property, and the temples of a defenceless people. The Samaritans were finally subdued by the regular forces of the East; 20,000 were slain, 20,000 were sold by the Arabs to the infidels of Persia and India, and the remains of that unhappy nation atoned for the crime of treason by the sin of hypocrisy." About sixty families are all now remaining, and these few relics of a once powerful people still dwell in their ancient capital, at the base of Mount Gerizim, under the shadow of their fallen temple.

The brother of my host was particularly fond of talking about them. He was very old, and the most deformed man I ever saw who lived to attain a great age. His legs were long, and all his limbs were those of a tall man, but he was so hump-backed that in sitting he rested upon his hump. He asked me many questions about the Samaritans in England (of America he had no knowledge), and seemed determined to believe that there were many in that country, and told me that I might say to them, wherever I found them, that there they believed in one omnipotent and eternal God, the five Books of Moses and a future Messiah, and the day of the Messiah's coming to be near at hand; that they practised circumcision, went three times a-year up to Mount Gerizim, "the everlasting mountain," to worship and offer sacrifice, and once a-year pitched their tents and left their virgins alone on the mount for seven days, expecting that one of them would conceive and bring forth a son, who should be the Messiah; that they allowed two wives, and in case of barrenness four; that the women were not permitted to enter the synagogue, except once a-year during fast, but on no account were they permitted to touch the sacred scroll; and that although the Jews and Samaritans had dealings in the market-places, &c., they hated each other now as much as their fathers did before them.

I asked him about Jacob's well; he said he knew the place, and that he knew our Saviour, or Jesus Christ, as he familiarly called him, very well; he was Joseph the carpenter's son, of Nazareth; but that the story which the Christians had about the woman at the well was all a fiction; that Christ did not convert her; but that, on the contrary, she laughed at him, and even refused to give him water to drink.

The information I received from these old men is more than I have ever seen in print about this reduced and singular people, and I give it for what it may be worth. I cannot help mentioning a little circumstance, which serves to illustrate the proverb that boys will be boys all the world over. While I was exploring the mysteries of the Samaritan creed, it being the season of Easter, a fine chubby little fellow came to me with a couple of eggs dyed yellow, and trying them on his teeth, just as we used to do in my boyish days (did we learn it from them or they from us?) gave me a choice; and, though it may seem a trifling incident to the reader, it was not an uninteresting circumstance to me, this celebration of my "paas" in the ancient Sychem, cracking eggs with a Samaritan boy.

CHAPTER XXXV.

Sebaste.—Ruins of the Palace of Herod.—Mount Tabor.—Nazareth.—Scriptural Localities.—Tiberias.—An English Sportsman.—Bethsaida and Chorazin.—Capernaum.—Zaffad.—Arrival at Acre.

At about eight o'clock in the morning we left Naplous; the lepers were lying at the gate as before; not permitted to enter the walls of the city, but living apart and perpetuating among themselves their loathsome race. The valley of Naplous was, if possible, more beautiful by morning than by evening light, shaded by groves of figs, olives, almonds, and apricots in full bloom, and bounded by lofty mountains, with a clear and beautiful stream winding and murmuring through its centre. Until I came to this place, I had frequently said to myself that I would not give the estate of a wealthy gentleman in Genesee for the whole kingdom of David; but there was a rare and extraordinary beauty here, even in the hands of the Arab Fellahs. Men and women were stealing among the trees, in gaily-coloured apparel, and, instead of the turban or toubouch, the men wore a long red cap, with the tassel hanging jauntily like that of a Neapolitan. For more than an hour we followed the course of the stream, and nothing could be more beautifully picturesque than the little mills on its banks; low, completely embosomed among trees, and with their roofs covered with grass, and sometimes the agreeable sound of a waterfall was the first intimation we had of their presence. There was something exceedingly rural and poetic in their appearance. I went down to one of them, more than usually beautiful, hoping to be greeted by some lovely "maid of the mill;" but, as if it were determined that every thing like illusion in the East should be destroyed for my especial benefit, the sight of one chamber, filled with sacks of grain, sheep and goats, and all kinds of filth, and a young girl sitting in the door, with the head of an old woman in her lap, occupied as is constantly seen in every miserable town in Italy, drove me away perfectly disgusted.

Leaving the valley, we turned up to the right, and, crossing among the mountains, in two hours came in sight of the ruins of Sebaste, the ancient Samaria, standing upon a singularly bold and insulated mountain, crowned with ruins. The capital of the ten tribes of Israel, where Ahab built his palace of ivory; where, in the days of Jereboam, her citizens sat in the lap of luxury, saying to their masters "come and let us drink," destroyed by the Assyrians, but rebuilt and restored to more than its original splendour by Herod, now lies in the state foretold by the prophet Amos: "Her inhabitants and their posterity are taken away." The ancient Samaritans are all gone, and around the ruins of their palaces and temples are gathered the miserable huts of the Arab Fellahs. Climbing up the precipitous ascent of the hill, we came to the ruins of a church, or tower, or something else, built by our old friend the Lady Helena, and seen to great advantage from the valley below. The Lady Helena, however, did not put together all this stone and mortar for the picturesque alone; it was erected over, and in honour of, the prison where John the Baptist was beheaded, and his grave. I knew that this spot was guarded with jealous care by the Arabs, and that none but Mussulmans were permitted to see it; but this did not prevent my asking admission: and when the lame sheik said that none could enter without a special order from the pacha, Paul rated him soundly for thinking we would be such fools as to come without one; and, handing him our travelling firman, the sheik kissed the seal, and, utterly unable to determine for himself whether the order was to furnish me with horses or admit me to mosques, said he knew he was bound to obey that seal, and do whatever the bearer told him, and hobbled off to get the key.

Leaving our shoes at the door, in one corner of the enclosure, we entered a small mosque with whitewashed walls, hung with ostrich eggs, clean mats for the praying Mussulmans, a sort of pulpit, and the usual recess of the Kehla. In the centre of the stone floor was a hole

opening to the prison below, and, going outside, and descending a flight of steps, we came to the prison chamber, about eight paces square; the door, now broken and leaning against the wall, like the doors in the sepulchres of the kings at Jerusalem, was a slab cut from the solid stone, and turning on a pivot. On the opposite side were three small holes, opening to another chamber, which was the tomb of the Baptist. I looked in, but all was dark; the Mussulman told me that the body only was there; that the prophet was beheaded at the request of the wife of a king, and I forget where he said the head was. This may be the prison where the great forerunner of the Lord was beheaded, at least no man can say that it is not; and leaving it with the best disposition to believe, I ascended to the ruined palace of Herod, his persecutor and murderer. Thirty or forty columns were still standing, the monuments of the departed greatness of its former tenant. On one side, towards the north-east, where are the ruins of a gate, there is a double range of Ionic columns. I counted more than sixty, and, from the fragments I was constantly meeting, it would seem as if a double colonnade had extended all around.

The palace of Herod stands on a table of land, on the very summit of the hill, overlooking every part of the surrounding country; and such were the exceeding softness and beauty of the scene, even under the wildness and waste of Arab cultivation, that the city seemed smiling in the midst of her desolation. All around was a beautiful valley, watered by running streams, and covered by a rich carpet of grass, sprinkled with wild flowers of every hue, and beyond, stretched like an open book before me, a boundary of fruitful mountains, the vine and the olive rising in terraces to their very summits. There, day after day, the haughty Herod had sat in his royal palace; and looking out upon all these beauties, his heart had become hardened with prosperity; here, among these still towering columns, the proud monarch had made a supper "to his lords, and high captains, and chief estates of Galilee;" here the daughter of Herodias, Herod's brother's wife, "danced before him, and the proud king promised with an oath to give her whatever she should ask, even to the half of his kingdom." And while the feast and dance went on, the "head of John the Baptist was brought in a charger, and given to the damsel." And Herod has gone, and Herodias, Herod's brother's wife, has gone, and "the lords, and the high captains, and the chief estates of Galilee," are gone; but the ruins of the palace in which they feasted are still here; the mountains and valleys which beheld their revels are here; and oh! what a comment upon the vanity of worldly greatness, a Fellah was turning his plough around one of the columns. I was sitting on a broken capital under a fig-tree by its side, and I asked him what were the ruins that we saw; and while his oxen were quietly cropping the grass that grew among the fragments of the marble floor, he told me that they were the ruins of the palace of a king—he believed, of the Christians; and while pilgrims from every quarter of the world turn aside from their path to do homage in the prison of his beheaded victim, the Arab who was driving his plough among the columns of his palace, knew not the name of the haughty Herod. Even at this distance of time I look back with a feeling of uncommon interest upon my ramble among those ruins, talking with the Arab ploughman of the king who built it, leaning against a column which perhaps had often supported the haughty Herod, and looking out from this scene of desolation and ruin upon the most beautiful country in the Holy Land.

Descending from the ruined city, we continued our way along the valley. In about an hour we came to the village of Beteen, standing on the side of a mountain, overlooking a fertile valley: the women were in the fields, as I had seen them before, picking the tares from the wheat. Riding along through a succession of beautiful valleys, nearly all the way close to the banks of a running stream, and stopping under a fine shade of olives for our noonday meal, we came to Sanpoor,

standing on an insulated hill, commanding an extensive view of the country, and once a strongly fortified place, with a tower and walls, supposed to have been built during the time of the crusades, but now totally demolished and in ruins. About three years ago it was taken, after a six months' siege, by Abdallah Pacha, the great soldier of the sultan; the insurgent inhabitants were put to the sword, and their houses burnt and razed to the ground. A little beyond this, the continued falls of rain have formed a small lake. In an hour and a half we passed the village of Abattia; and late in the afternoon we fell in with a party of Turkish travellers, one of whom was the "biggest in the round" of all the men I had seen in the East. His noble horse seemed to complain of his extraordinary burden. At about six o'clock we had left the beautiful country of Samaria, and were entering the little town of Jennin, or Janeen, standing on the borders of Galilee, at the commencement of the great plain of Jezreel.

Early in the morning, leaving the village of Janeen, we entered almost immediately the great plain of Jezreel. The holy places were now crowding upon me in rapid succession. I was on my way to Nazareth, the city of Joseph and Mary, where Christ spent nearly all his life; but I turned off the direct road to do homage on Mount Tabor, recognised as the scene of our Saviour's transfiguration. We passed two miserable villages, looking at a distance like little mounds or excrescences on the surface of the great plain; and, turning to the right, around the mountains of Samaria, saw afar off the lofty summit of Hermon, crowned with a sheik's tomb. On the right, towards the Sea of Galilee, was the village of Bisan, the Bethshan of the Bible, where the Philistines fastened the bodies of Saul and his three sons to the walls after they had fallen in Mount Gilboa.\*

Before us, and the most striking and imposing object on the whole of the great plain of Esdrael, was Mount Tabor. It stands perfectly isolated; rising alone from the plain in a rounded tapering form, like a truncated cone, to the height of 3000 feet, covered with trees, grass, and wild flowers, from the base to its summit, and presenting the combination so rarely found in natural scenery of the bold and the beautiful. At twelve o'clock we were at the miserable village of Deborah, at the foot of the mountain, supposed to be the place where Deborah the prophetess, who then judged Israel, and Barak and "10,000 men after him, descended upon Sisera, and discomfited him and all his chariots, even 900 chariots of iron, and all the people that were with him." The men and boys had all gone out to their daily labour, and we tried to persuade a woman to guide us to the top of the mountain, but she turned away with contempt; and having had some practice in climbing, we moved around its sides until we found a regular path, and ascended nearly to the top without dismounting. The path wound around the mountain, and gave us a view from all its different sides, every step presenting something new, and more and more beautiful, until all was completely forgotten and lost in the exceeding loveliness of the view from the summit. Stripped of every association, and considered merely as an elevation commanding a view of unknown valleys and mountains, I never saw a mountain which, for beauty of scene, better repaid the toil of ascending it; and I need not say what an interest was given to every feature when we saw in the valley beneath the large plain of Jezreel, the great battle-ground of nations; on the south the supposed range of Hermon, with whose dews the psalmist compares the "pleasantness of brethren dwelling together in unity;" beyond, the ruined village of Endor, where dwelt the witch who raised up the prophet Samuel; and near it the little city of Nain, where our Saviour raised from the dead the widow's son; on the east, the mountains of Gilboa, "where Saul, and his armour-bearer, and his three sons, fell upon their swords, to save themselves

from falling into the hands of the Philistines; beyond, the Sea of Galilee, or Lake of Genesareth, the theatre of our Saviour's miracles, where in the fourth watch of the night he appeared to his terrified disciples, walking on the face of the waters; and to the north, on a lofty eminence, high above the top of Tabor, the city of Saphet, supposed to be the ancient Bethulia, alluded to in the words "a city that is set on a hill cannot be hid."

But if the tradition be true, we need not go beyond the mountain itself, for it was on this high mountain that "Jesus Christ took Peter, and James, and John his brother, apart," and gave them a glimpse of his glory before his death, when "his face did shine as the sun, and his raiment was white as the light; and a voice out of the cloud was heard, saying, This is my beloved son, in whom I am well pleased." I stood on the very spot where this holy scene was enacted. Within the walls of an old fortress is a ruined grotto, with three altars built as Peter had proposed, one for Christ, one for Moses, and one for Elias; where, once a year, the monks of the convent, and all the Christians of Nazareth, ascending in solemn procession, offer adoration and praise to the Saviour of the world. The top of the mountain is an oval, about half a mile long, and encompassed by a wall built by Josephus when he was governor of Galilee; within this enclosure is a table of luxuriant grass and wild flowers, sending forth such an odour, and looking so clean and refreshing, that, when my horse lay down and rolled in it, I felt the spirit of boyhood coming over me again, and was strongly tempted to follow his example.

We descended and hurried on towards Nazareth. Winding along the valley, an accidental turn brought the mountain again full before me, alone, and strongly defined against the sky; the figure of a man could have been seen standing on the top as on a pedestal. I know not whether, in the splendid effort of Raphael that now adorns the Vatican, he had any idea of this particular mountain; but I remember that, looking back upon it at this time, it struck me that it was exactly the scene which the daring genius of the painter might have selected for the transfiguration of the Son of God.

In two hours and a half we were in the vale of Nazera, and approaching the city of Nazareth. The valley is fertile, surrounded by hills, and the city stands at the extreme end on the side of an elevation. The houses are white, and in the place of Christ's residence, as of his birth, the mosque with its minaret is the most conspicuous object, and next to that the convent. A little on this side is a Greek church, built, as the Greeks say, over the spot where the angel Gabriel appeared to the Virgin Mary, and announced to her the birth of a son, "of whose kingdom there should be no end." A little farther is a fountain, where the Virgin is said to have been in the habit of going for water; a procession of women, with large jars on their heads, was coming out from the city, and one of them, a Christian woman, gave us to drink; a comfortable-looking monk, taking his afternoon's promenade in the suburbs, was the first to greet us, and following him, we dismounted at the door of the convent—one of the largest in the Holy Land.

In the city where Joseph and Mary lived, and where our Saviour passed thirty years of his life, there is of course no lack of holy places; and as in the case of the Church of the Holy Sepulchre, as many of these places as possible have, with admirable economy, been brought under one roof. The Church of the Annunciation, within the walls of the convent, next to the Church of the Holy Sepulchre, is the finest in the Holy Land. There are two organs, and the walls and pillars are hung with red damask. Under the principal altar is the house of Joseph and Mary, consisting of several grottoes, kitchen, parlour, and bedroom. In front of the same altar are two granite columns, designating the spots where the angel and the Virgin stood at the time of the annunciation. One of them is broken off

\* Joshua, xvii. 11; 1 Samuel, xxxi. 12; Kings, iv. 12.

below, and the upper part hangs from the roof—the monks say by a miracle, but others by mortar; and all over Galilee the miraculous pillar is celebrated for its virtue in curing diseases. Outside the convent are the workshop where Joseph wrought at his carpenter's trade, and the synagogue, where Christ, by reading the book of Isaiah, and applying to himself the words of the prophet, so exasperated the Jews that they rose up and thrust him out of the city. A lamp was burning dimly at the altar, and an Arab Christian prostrating himself before it; and, lastly, I saw the table on which, say the monks, our Lord dined with his disciples both before and after the resurrection—a large flat stone about three feet high, and fifteen paces in circumference. I was about knocking off a piece as a memorial, when the friar checked me, and turning round a nail in one of the many holes in the surface, he worked off a little powder, laid it carefully in a paper, and gave it me.

In my humour there was no great interest in visiting these so-called holy places; but here was the city in which our Saviour had been brought up. I could walk in the same streets where he had walked, and look out upon the same hills and valleys; and a man of warm and impassioned piety might imagine that, in breathing the same atmosphere, he was drawing nearer to the person of the Saviour. I went back to the convent, joined the monks at vespers, listened to the solemn chant and the majestic tones of the organ, and went to bed.

Early in the morning, changing for the first time the horses with which I had come from Jerusalem, I took a Christian of Nazareth for my guide, and started for Tiberias and the Sea of Galilee. In about an hour we came to Cana of Galilee, where our Saviour performed his first miracle by turning water into wine. At the entrance of the village is a fountain, where the women were drawing water in large jars, and near it a Greek church, built over the house of the young man at whose wedding the miracle was performed. Here, too, are large stone jars, being, as the monks say, the identical vessels in which the water was changed. War, bloody and relentless war, has swept over the little Cana of Galilee; fire and sword have laid waste and destroyed the peaceful village in which Christ met the rejoicing wedding-party.

In about two hours, leaving Mount Hermon and Mount Tabor on our right, we passed through the field where the disciples plucked the corn on the Sabbath day; about half an hour farther on is the mountain of the Beatitude, where Christ preached the sermon on the mount. Whether the tradition be true or no, it was just the place where, in these primitive days, or even in the state of society which exists now in the Holy Land, such an event might have taken place; the preacher standing a little distance up the hill, and the multitude sitting down below him. Indeed, so strikingly similar in all its details is the state of society existing here now to that which existed in the time of our Saviour, that I remember, when standing on the ruins of a small church supposed to cover the precise spot where Christ preached that compendium of goodness and wisdom, it struck me that if I or any other man should preach new and strange things, the people would come out from the cities and villages to listen and dispute, as they did under the preaching of our Lord.

Half an hour farther on we came to a large stone, on which, tradition says, our Saviour sat when he blessed the five loaves and two fishes, and the immense multitude ate and were filled. These localities may be, and probably are, mere monkish conjectures; but one thing we know, that our Saviour and his disciples journeyed on this road; that he looked upon the same scenes, and that, in all probability, somewhere within the range of my eye these deeds and miracles were actually performed. At all events, before me, in full view, was the hallowed Lake of Genesareth. Here we cannot be wrong; Christ walked upon that sea, and stilled the raging of its waters, and preached the tidings of salvation to the cities on its banks. But where are those

cities now? Chorazin and Bethsaida, and thou, too, Capernaum, that was exalted unto heaven! The whole lake is spread out before me, almost from where the Jordan enters unto where that hallowed stream passes on to discharge its waters in the bituminous lake which covers the guilty cities; but there is no city, no habitation of man—all is still and quiet as the grave. But I am wrong; towards the southern extremity of the lake I see the city of Tabbereeah, the miserable relic of the ancient Tiberias, another of the proud cities of Herod, standing on the very shore of the sea, a mere speck in the distance, its walls and turrets, its mosques and minarets, telling that it is possessed by the persecutors and oppressors of the followers of Christ.

We descended the mountains, and passing under the walls of the city, continued on about half an hour to a large bath erected by Ibrahim Pacha over the hot springs of Emmaus, celebrated for their medicinal properties; and finding that we could pass the night there, left our baggage and returned to the city. The walls and circular towers, Moorish in their construction, gave it an imposing appearance; outside the gate was the tent of a harlot, that unhappy class of women not being permitted, by the Mussulman law, to enter the walls; within, all was in a most ruined and desolate condition; a great part being entirely vacant, and, where the space was occupied, the houses or huts were built far apart.

Tiberias was the third of the holy cities of the Jews; and here, as at Jerusalem and Hebron, the unhappy remnant of a fallen people still hover around the graves of their fathers, and, though degraded and trampled under foot, are still looking for the restoration of their temporal kingdom. There were two classes of Jews, Eastern and European, the latter being Muscovites, Poles, and Germans; all had come merely to lay their bones in the Holy Land, and were now supported by the charity of their brethren in Europe. There were two synagogues, and two schools or colleges; and it was an interesting sight to see them, old men tottering on the verge of the grave, and beardless boys studying in the same mysterious book what they believed to be the road to heaven.

I inquired for their rabbi, and they asked me whether I meant the Asiatic or European. I told them the greater of the two, and was conducted by a crowd to his house. I had no diffidence in those days, and invited myself to sit down and talk with him. He was an old man, and told me that they were all poor, living upon precarious charity; and that their brethren in America were so far off that they had forgotten the land of their fathers. Every thing looked so comfortable in his house, that I tried to get an invitation to stay all night; but the old rabbi was too cunning for me. It was a fête day, but my notes are so imperfect that I cannot make out whether it was their Sabbath. All were dressed in their best apparel, the women sitting in the doors or on the terraces, their heads adorned with large gold and silver ornaments, and their eyes sparkling like diamonds.

Returning, I noticed more particularly the ruins beyond the southern wall. They extend for more than a mile, and there is no doubt that this ground was covered by the ancient city. The plain runs back about half a mile to the foot of the mountain, and in the sides of the mountain are long ranges of tombs. It was from one of these tombs, said our guide, that the man possessed of devils rushed forth when our Saviour rebuked the unclean spirits, and made them enter into a herd of swine, which ran violently down a steep place into the sea, and were drowned.

Passing the bath, I walked on to a point where I could see the extreme end of the lake, forming near the other side into the Jordan. It was a beautiful evening, still and quiet as the most troubled spirit could wish. The sides of the mountains were green and verdant, but there were no trees, and no rustling of the wind among the branches; not a boat was upon the lake; and, except the city of Tiberias, which, enclosed within its walls, gave no signs of life, I was

the only living being on its shores; I almost felt myself alone in the world; and surely, if ever there was a spot where a man might be willing to live alone, it would be there. There was no desolation, but rather beauty in the loneliness; and when the sun was setting, I was bathing my feet in the waters of the hallowed lake, and fast falling into the belief that I could sit me down on its banks, "the world forgetting, by the world forgot;" but just then I saw filing under the walls of Tiberias a long procession of men. They were coming to the baths of Emmaus; and, in a few moments, I, that was musing as if I were alone in the world, was struggling with naked Arabs for a place in the bathing apartment.

A large bathing-house has been built over the hot springs by Ibrahim Pacha—a circular building, with a dome like the baths at Constantinople; and under the dome a large marble reservoir, twenty feet in diameter, and nearly six feet deep, into which the Arabs slipped off from the sides like turtles, darkening the white marble and the clear water with their swarthy skins. I could not bear the heat, which seemed to me scalding. A separate room, with a single bath, had been built expressly for the precious body of Ibrahim Pacha; and as he was not at hand to use it, I had it prepared for myself. Here was a theme for moulting! I had stood on the top of the pyramids, on Mount Sinai, and the shores of the Dead Sea; I had been in close contact with greatness in the tombs of Augustus, Agamemnon, and the Scipios; but what were these compared with bathing in the same tub with the great bulldog warrior of the East, the terrible Ibrahim Pacha? I spread my rug in an adjoining chamber; the long window opened directly upon the Sea of Galilee; for more than an hour my eyes were fixed upon its calm and silvery surface; and the last sounds that broke upon my ears were the murmurs of its waters.

Early in the morning we started. Stopping again at Tiberias, the soldier at the gate told us that a European had arrived during the night. I hunted him out, and found him to be an Englishman, as I afterwards learned, a merchant of Damascus, and a sportsman, equipped with shooting-jacket, gun, dog, &c. He was in a miserable hovel, and, having just risen, was sitting apart from the Arab family; his rug and coverlet were lying on the mud floor not yet rolled up; and he seemed in a most rueful mood, objurating all travel for pleasure, and whistling earnestly "There's no place like home." I knew his humour, for I had often felt it myself, and could hardly keep from laughing. He was not more than half dressed, and reminded me of the caricature of an Englishman standing in his nether garment, with a piece of cloth in one hand and a pair of scissors in the other, as not being resolved after what fashion to have his coat cut.

"I am an English gentleman, and naked I stand here,

Musing in my mind what raiment I shall wear;

For now I will wear this, and now I will wear that,

And now I will wear—I cannot tell what."

We spent half an hour together, and parted. He was an old stager, and did not travel for scenery, associations, and all that, but he could tell every place where he had bagged a bird, from Damascus to the Sea of Galilee.

Stopping for a moment at the only monument of antiquity, the church of St Peter, a long building, with a vaulted stone roof, built, as the monks say, over the place where the house of St Peter stood, and the corner stone laid by our Saviour; a burly monk was in the confessional, and a young Christian girl pouring into his greedy ears perhaps a story of unhappy love; we left for the last time the gate\* of the city, the tent of the harlot standing there still, and commenced our journey along the shore of the sea.

A short distance from Tiberias we crossed the point of a mountain running down into the lake, and in about

\*About six months after, this gate was swallowed up by an earthquake; the wall and the whole of that quarter of the city were thrown down and demolished, and a great portion of the inhabitants buried under the ruins.

an hour came to a small Mohammedan village, called Magdol, supposed to be the Magdala into which our Saviour came when he had sent away the multitude, after feeding them with the seven loaves and two fishes. It was along this shore that Jesus Christ began to preach the glad tidings of salvation to a ruined world; 1800 years ago, walking by this sea, he saw two brethren, "Simon Peter, and Andrew his brother, casting their nets into the sea, toiling all day and catching no fish; and he told them to thrust forth from the land; and their nets brake, and their ships sank with the multitude of fish; and he said unto them, Follow me, and I will make you fishers of men; and they forsook all and followed him."

We were now crossing a rich valley, through which several streams were running and emptying into the lake; and towards the other end, at some distance from the sea, we came to a small mound of crumbling bricks and stones, almost overgrown with grass; and this is all that remains of the city of Bethsaida, the city of Peter, and Andrew, and Philip. If we had diverged a hundred yards one way or the other, I should have passed without seeing it. A short distance off, among the hills that border the plain, alike in ruins, is her sister city Chorazin. Leaving the valley, and crossing a rude point of the mountain, which runs boldly to the lake, the road being so narrow that we were obliged to unload the baggage-horse, we descended to the plains of Genesareth, the richest and most fertile plain on the shores of the lake, and, perhaps, for a combination of natural advantages, soil, beauty of scenery, climate, and temperature, exceeded by no place in the world. A short distance across the plain we came to a little mill, set in motion by a large, clear, and beautiful stream, conveyed in two stone aqueducts. Four or five Arab families lived there, in huts made with palm leaves; the men lay stretched on the ground, lulled to sleep by the murmur of the falling waters.

From here to Talhoun, the supposed site of Capernaum, the rich plain of Genesareth was lying a wild and luxuriant waste, entirely uncultivated and neglected, except in one place, where an Arab was ploughing a small plot for tobacco. Approaching, the single Arab foot-path becomes lost, and the road which our Saviour had often followed upon his great errand of redemption was so overgrown with long grass, bushes, and weeds, that they rose above the back of my horse, and I found it easier to dismount and pick my way on foot.

The ruins of Capernaum extend more than a mile along the shore and back towards the mountain, but they were so overgrown with grass and bushes that it was difficult to move among them. Climbing upon a high wall, which, though ruined itself, seemed proud of its pre-eminence above the rest, I had a full view of the ruins of the city, of the plains of Genesareth, and the whole extent of the Sea of Galilee, from where the Jordan comes down from the mountains until it passes out and rolls on to the Dead Sea. It is about sixteen miles long, and six wide; at each end is the narrow valley of the Jordan; on the east a range of mountains, rising, not precipitously, but rolling back from the shore, green and verdant, but destitute of trees; on the west are mountains, in two places coming down to the lake; and the rest is a rich and beautiful, but wild and uncultivated, plain. It was by far the most imposing view I had enjoyed, and I am not sure that in all my journeying in the East I had a more interesting moment than when I sat among the ruins of Capernaum, looking out upon the Lake of Genesareth.

Travellers have often compared this lake with the Lake of Geneva. I could see very little resemblance; it is not so large, and wants the variety of scenery of the Lake of Geneva, and, above all, the lofty summit of Mont Blanc. The banks of the Lake of Geneva are crowded from one end to the other with villages and villas, and its surface is covered with boats, and all the hurry and bustle of a travelling population; this is, in the wildness of nature, all neglected and uncultivated; and, except the little town of Tiberias, not a habitation, not

even an Arab's hut, is seen upon its banks, not a solitary boat upon its waters. A single pelican was floating at my feet, and, like myself, he was alone. He was so near me that I could have hit him with a stone; he was the only thing I saw that had life, and he seemed looking at me with wonder, and asking me why I still lingered in the desolate city. I was looking upon the theatre of mighty miracles; it was here that, when a great tempest arose, and the ship was covered with waves, and his disciples cried out, "Save us, or we perish," Christ rose from his sleep, and rebuked the wind and the sea, "and there was a great calm;" and here too it was that in the fourth watch of the night he appeared to his terrified disciples, walking on the face of the sea, and crying out to them, "It is I, be not afraid;" and again the wind ceased, and there was a calm.

But this scene was not always so desolate. The shores of this lake were once covered with cities, in which Christ preached on the Sabbath day, healed the sick, gave sight to the blind, cleansed the lepers, cast out devils, and raised the dead. Bethsaida and Chorazin I had passed, and I was standing among the ruins of Capernaum, the city that was exalted to heaven in our Saviour's love; where Christ first raised his warning voice, saying, "Repent, for the kingdom of heaven is at hand;" and I could feel the fulfilment of his prophetic words, "Wo unto thee, Chorazin, wo unto thee, Bethsaida; it shall be more tolerable for Tyre and Sidon in the day of judgment than for you. And thou, Capernaum, which art exalted unto heaven, shall be brought down to hell, and it shall be more tolerable for the land of Sodom in the day of judgment than for thee." I am aware that lately there has been some dispute whether this be the site of Capernaum, but I had now passed along the whole western shore of the lake, and, if this be not Capernaum, my horse's hoofs must have trampled upon the city of our Saviour's love without my knowing where that city stood.

I thought to enhance the interest of this day's journey by making my noonday meal from the fish of the Lake of Genesareth; obliged to go back by the mills, and having on my way up seen a net drying on the shore, I had roused the sleeping Arabs, and they had promised to throw it for me; but when I returned, I found that like Simon Peter and the sons of Zebedee, "they had toiled all day, and had caught no fish."

Here we turned away from the consecrated lake, and fixed our eyes on the end of my day's journey, the towering city of Zaffad. But the interest of the day was not yet over. Ascending for about an hour from the shore of the lake, we came to the great caravan road from Jerusalem to Damascus, and a little off from this to a large khan; and within this khan, according to tradition, is the pit into which Joseph was thrown by his brethren before they sold him to the Ishmaelites. The khan, like all other caravanserais, is a large stone building, enclosing a hollow square, with small chambers around it for the accommodation of caravan travellers. The pit is a solid piece of mason-work, like a well; and, when I saw it, was nearly full of water. Both Mussulmans and Christians reverence this as a holy place; near it are a Mussulman mosque and a Christian chapel; and few travellers pass this way, whether Mussulmans or Christians, without prostrating themselves before the altar of Joseph the Just.

In all probability, the legend establishing this locality has no better foundation than most of the others in the Holy Land; but I cannot help remarking that I do not attach the importance assigned by others to the circumstance of its distance from Hebron, at that time Jacob's dwelling-place. We know that Joseph's brethren were feeding their father's flock at Shechem; and when Joseph came thither "wandering in the field, he inquired after his brethren, and a man told him, They are departed hence, for I heard them say, let us go to Dothan; and Joseph went after his brethren, and found them in Dothan." If there be any good reason for calling this place Dothan, to me it does not seem at all strange, that, in the pastoral state of society which existed then,

and still exists unchanged, Jacob's sons had driven their flocks to a pasture-ground two days farther on; and affording a striking illustration of the scene supposed to have taken place here, while we were loitering around the khan, a caravan of merchants from Damascus came up, on their way to Egypt; and the buying or selling of slaves, white or black, being still a part of the trade between these places, I have no doubt that, if I had offered Paul for sale, they would have bought him and carried him to Egypt, where, perhaps, he might have risen to be a grand vizier. From hence we continued mounting again, the city of Zaffad seeming to detach itself more and more, and to rise higher and higher above surrounding objects, and the atmosphere growing perceptibly colder; and at four o'clock we had reached the city.

Zaffad is the last of the four holy cities of the Jews. My intercourse with the Jews in the Holy Land had been so interesting, that I determined to prolong it to the last, and having heard a favourable report of a Jew, the English consular agent at Zaffad, I rode directly to his house. He was a very poor and a very amiable man. I went with him to the governor, showed my firman, and demanded permission to see the grotto of Jacob. The governor was sick, and told me that God had sent me there expressly to cure him. Since my successful experiment upon the governor of Hebron, I began to think doctoring governors was my forte, and, after feeling his pulse, and making him stick out his tongue, upon the principle that a governor was a governor, and what was good for one was good for another, I gave him an emetic which almost turned him inside out, and completely cured him. One thing I cannot help observing, not with a view of impeaching any thing that is written, but as illustrating the state of society in the East, that if a skillful physician, by the application of his medical science, should raise an Arab from what, without such application, would be his bed of death, the ignorant people would be very likely to believe it a miracle, and to follow him with that degree of faith which would give credence to the saving virtue of touching the "hem of his garment."

From the palace of the governor we ascended to the ruined fortress crowning the very top of the hill, and from one of the windows of the tower I looked down upon an extensive prospect of hills and valleys; the Lake of Genesareth seemed almost at my feet; the stately and majestic Tabor was far below me, and beyond was the great plain of Jezreel, stretching off to the mountains of Carmel and the shores of the Mediterranean. In all my wanderings in the most remote places, I had been constantly seeing what I may call the handwriting of Napoleon. In Italy, Poland, Germany, and the burnt and rebuilt capital of the czars, at the pyramids and cataracts of the Nile, and now, on this almost inaccessible height, the turrets of the fortress were battered by the French cannon.

We descended again to the Jews' quarter. Their houses were on the side of the hill, overlooking a beautiful valley. It was the last day of eating unleavened bread, and the whole Jewish population, in their best attire, were sitting on the terraces and on the tops of their houses, in gay, striking, and beautiful costumes, the women with their gold and silver ornaments on their heads and around their necks, enjoying the balmy mildness of a Syrian sunset; and when the shades of evening had driven them to their houses, I heard all around me, and for the last time in the Holy Land, rising in loud and solemn chants, the Songs of Solomon and the Psalms of David.

There are about 200 families of Israelites in Zaffad; they come there only to lay their bones in the land of their fathers; have no occupation or means of livelihood; spend all their time in reading the Bible and Talmud, and live upon the charity of their European brethren. The agent told me that during the late revolution they had been stripped of every thing; that, as at Hebron, they had suffered robbery, murder, and rapine; that the governor had allowed them to take

refuge in the fortress, where they remained, 3000 in number, without a mat to lie on or bread to put in their mouths; many of them had died of starvation, and the living remained beside the bodies of the dead till the whirlwind passed by: that, thinking himself save under his foreign protection, he had remained below, but that his hat with the consular cockade had been torn off and trampled under foot; and his wife, a lovely young woman sitting by our side, then not more than nineteen, had been thrown down, whipped, and he did not tell me so, but I inferred that far worse had befallen her; and the brutal Turk who committed the outrage still lived, and he met him in the streets every day.

During the evening a Christian from Nazareth came in, and it struck me as an interesting circumstance that I was introduced to him as a brother Nazarene.

A Jew welcomed me to the first of the holy cities, and a Jew accompanied me on my exit from the last. Both received me into their houses, and gave me the best that they had, and both refused to accept a price for their hospitality. I had a hard day's journey before me. My Jewish friend had told me that it would be necessary to make a very early start to arrive at Acre that night, but it so happened that I set off late. We had a ravine to cross, the worst I had met in Syria. Paul and I were some distance ahead, when we heard the shouting of our muleteer; our baggage mule had fallen, and caught on the brink of a precipice, where he was afraid to move until we came to his help; and this and the exceeding roughness of the road detained us so much, that when we reached the other side of the ravine, my guide told me that it would be utterly impossible to reach Acre that day. I would have returned, but I did not want to throw myself again upon the hospitality of my Jew friend. I was in a bad condition for roughing it; but at the risk of being obliged to sleep in some miserable Arab hut, or perhaps under the walls of Acre, I pushed on.

For two or three hours there was no improvement in the road; we were obliged to dismount several times, and could not do more than pick our way on a walk. We then came to the village of Rinah, situated in a fine olive-grove. The villagers told us it would be impossible to reach Acre before night, but a bribe to my guide induced him to lead off on a brisk trot. Of every man we met we asked the distance; at length we came to one who told us he thought we might do it. I could almost always tell beforehand the answer we should get; when we came to a lazy fellow, sprawling on the ground and basking in the sun, he invariably said no; and when we met an Arab, riding nimbly on his mule, or striding over the ground as if he had something to do and meant to do it, his answer was always yes; and so we were alternately cheered and discouraged. We watered our horses at the stream without dismounting. About mid-day Paul handed me a boiled fowl, holding on by one leg while I pulled at the other; the fowl came apart, and so we dined on horseback without stopping. I am not sure, but I do not think there was any thing particularly interesting on the road; once, riding over a fine, well-cultivated valley, we saw at a distance on the right two handsome villages, and standing alone, something which appeared to be a large white mosque or sheik's tomb.

At about four o'clock we came in sight of the Mediterranean, the great plain of Acre, the low circular shore extending to Caïpha and Mount Carmel; and before us, at a great distance, on an extreme point in the sea, the ancient Ptolemais, the St Jean d'Acre of Richard and the crusaders. Still we were not safe. The sun was settling away towards my distant home, when we reached the shore of the sea. I shall never forget my sensations at the moment when I gained that shore; after the Red Sea and the Dead Sea, and the Sea of Galilee, it seemed an old acquaintance, and I spurred my horse into the waters to greet it. But I had no time to dally, for as yet I was not secure. I joined the last of the loungers outside the walls; the heavy gates were swung to as I entered; and when I

pushed my jaded horse over the threshold of the gate, I felt as happy as the gallant leader of the crusaders when he planted the banner of England upon the walls of Acre. Soon in the peaceful cell of the convent, I forgot my toil and anxiety, as well as Richard and the holy wars. The night before I had slept by the quiet waters of Galilee, and now the last sounds that I heard were the rolling waves of the Mediterranean.

## CHAPTER XXXVI.

A Ride on Donkeyback.—Caïpha.—Adventure with a Consul.—Mount Carmel.—The Plain of Jezreel.—Convent of Mount Carmel.—Kindness of the Monks.—Curiosity Gratified.

I ROSE next morning much fatigued. My strength had been greatly impaired by sickness and exposure, and I intended to give myself a day of rest, instead of which I committed an act of folly. The night before I left Jerusalem, I had seen, at the house of my friend Mr Whiting, the poetical pilgrimage of M. de Lamartine; I had not time to read it through, and by chance opened it at the chapter containing the particulars of his visit to Caïpha; and the glowing account which he gave of the two sisters of the Sardinian consul had inflamed in some degree my imagination. I had found it one of the most annoying circumstances attendant upon travelling in the East, that, in spite of the poetical accounts of Eastern beauty, though I had seen Georgian and Circassian women, I had never yet met with any thing that to my mind was equal to the beauty of the European and American women. I had passed Caïpha, and it was a direct retrograde movement to go there; but early in the morning, as I was walking on the ramparts of Acre, I looked back towards the little city, and the beautiful creations of the poet rose before me in most ravishing colours. I was worn down. There was no physician in Acre; and, perhaps, to bask an hour in the sunshine of beauty might revive and restore me. Paul, too, was under the weather; ever since his fall from the dromedary he had wanted bleeding, and it might do him good. In short, I had been rambling for months among ruins and old cities, working as hard as if I were to be paid for it by the day; I had had enough of these things, and one glimpse of a beautiful girl was worth more to me at that moment than all the ruins of the Holy Land; but I would not admit to myself, much less to Paul, that I was making this retrograde movement merely to see a couple of pretty faces, and I ordered horses for Caïpha and Mount Carmel. Horses, however, were not to be had, and we were obliged to take donkeys, which I considered unlucky. For the first time since I left Jerusalem I brushed my tarbouch, my blue jacket, and grey pantaloons.

I started on donkeyback. Caïpha is distant a ride of about three hours and a half from Acre, all the way along the shore of the sea. About half an hour from Acre, we crossed the river Belus in a boat. It was on the banks of this stream that Elijah killed the 400 prophets of Baal, gathered unto Mount Carmel by the orders of Ahab. A dead level plain, fertile but uncultivated, stretched back for many miles into the interior, and in the front to the foot of Mount Carmel. We rode close along the shore, where the sand was every moment washed and hardened by the waves. The sea was calm, but the wrecks on the shore, of which we counted seventeen on our way to Caïpha, told us that the elements of storm and tempest might lurk under a fair and beautiful face; all which was apropos to my intemperate visit. On the way I thought it necessary to let Paul into part of my plans, and told him that I wanted to stop at the house of the Sardinian consul. Paul asked me whether I had any letter to him; I told him no; and by degrees disclosed to him the reason of my wanting to go there; and he surprised me by telling me that he knew the young ladies very well; and when I asked him how and when, he told me that he had assisted them in their cooking when he stopped there three years before with Mr Wellesley.

This was rather a damper ; but I reflected that Haidee, on her beautiful little island, prepared with her own hands the food for the shipwrecked, and revived at the thought.

We were now approaching Caïpha. The city was walled all around; without the walls was a Mohammedan burying-ground; and the gate, like the shields of Homer's heroes, was covered with a tough bull's hide. I rode directly to the consul's house; it was a miserable-looking place, and on the platform directly before the door stood a most unpoetical heap of dirt and rubbish; but I didn't mind that; the door was open, and I went in. The table was set for dinner, and I could not help remarking a few rather questionable spots on the table-cloth; but I didn't mind that; knives, forks, and plates were a spectacle to which I had long been unaccustomed, and my heart warmed even to the empty platters. I thought I had come at the witching moment, and I felt as sure of my dinner as if I had it already under my jacket. The consul was sitting on a settee, and I began the acquaintance by asking him if there was an American consul there. He told me no; at which I was very much surprised, as we had one at Jaffa, not so much of a place as Caïpha; and I invited myself to a seat beside the consul, and made myself agreeable. I soon found, however, that I was not so pleasant a fellow as I thought. The consul answered my questions, but his manner might be interpreted, "Don't you see you are keeping the dinner waiting?" I didn't mind that, however, but talked about the necessity of my government having a consul there to entertain American travellers, and suggested that at Jaffa the government had given the appointment to the then acting Sardinian consul; still my friend was impenetrable. I tried him upon several other topics, but with no great success. During this time the mother entered, evidently in dishabille, and occasionally I got a glimpse of a pair of fine black eyes peeping at me through the door. At last, when I found that he was bent on not asking me to dine, I rose suddenly, made a hundred apologies for my haste, shook him cordially by the hand, and, with most consummate impudence, told him that I would call again on my return from Mount Carmel. Paul rather crowed over me, for he had met and spoken to the young ladies, and in the same place where he had seen them before.

In about an hour we had reached the top of Mount Carmel; this celebrated mountain is the only great promontory upon the low coast of Palestine, and it is, beyond all comparison, the finest mountain in the Holy Land. The traveller at this day may realise fully the poetical description by the inspired writers, of the "excellency" of Mount Carmel. The pine, oak, olive, and laurel, grew above a beautiful carpet of grass and wild flowers, and from amid this luxuriance I looked out upon the plains of Acre, the little city stretching out on a low point, like a mere speck in the water, and beyond, the mountains of Lebanon; on the left, along the shore of the Mediterranean to the ruins of Cesarea, the once proud city of Herod and of Cornelius the centurion, where Paul made Felix tremble; in front, the dark blue sea, on whose bosom two transports, with Egyptian soldiers on board, were at that time stretching under easy sail from Acre to Alexandria; and behind, the great plain of Jezreel.

One word with regard to this great plain. I had travelled around, and about, and across it; had looked at it from hills and mountains, and I was now on the point of leaving it for ever. This plain, computed to be about fifteen miles square, is the "mighty plain," as it is called, of the ancients, and celebrated for more than 3000 years as the "great battle-ground of nations." From here Elijah girded up his loins, and ran before Ahab to the entrance of Jezreel; it was on this plain that Barak went down, and 10,000 men after him, and discomfited Sisera and all his chariots; it was here that Josiah, king of Judah, disguised himself, that he might fight with Necho, king of Egypt, and fell by the arrows of the Egyptian archers. The Assyrian and the Per-

sian, Jews and Gentiles, crusaders and Saracens, Egyptians and Turks, Arabs and Frenchmen, warriors of every nation, have poured out their blood on the plains of Esdraelon; and here, said a gentleman whom I met in Palestine skilled in the reading and interpretation of the prophecies, will be fought the great final battle with antichrist, when circumstances which are now supposed to be rapidly developing themselves shall bring together a mighty army of the followers of Christ, under the banner of the cross, to do battle in his name, and sweep from the earth his contemners and opposers.

The convent on Mount Carmel is worthy of the place where it stands, and, like the mountain itself, is the best in the Holy Land. The church, which is unfinished, is intended to be a very fine building, and the interior of the convent is really beautiful. I could hardly believe my own eyes when I saw, in rooms provided for travellers, French bedsteads with curtains, and French dressing-tables. The rules of their order forbid the Carmelite friars to eat meat; but they set me down to such a dinner, to say nothing of the wines of Mount Lebanon, that, so far as regarded the eating and drinking merely, I was glad I had not invited myself to dine with my friend the consul at Caïpha. From my seat at the table I looked out upon the distant sea; the monks were all gathered around me, kind, good men, happy to receive and talk with a stranger; and it is no extravagance to say, that, after having been buffeted about for months, I felt at the moment that I could be almost willing to remain with them for ever. I ought not to tell it, but the fact is, the extraordinary comfort of the convent, and the extraordinary beauty of the scene, drove away all the associations connected with this gathering-place of the prophets. I wanted nothing but what I saw before me. The monks told me that there was fine shooting on the mountain. I could throw myself into the clearest of waters, and bathe, or, with my little boat, could glide over to Caïpha or Acre. For an invalid in search of retirement, with every beauty that climate and natural scenery can offer, I know no place superior to the convent at Mount Carmel. It is one of the few places I ever saw where a man could be cheerful and happy in perfect seclusion. Books, the mountain, the sky, and the sea, would be companions enough. It would be the sweetest spot on earth for a very young couple to test the strength of their poetic dreams; and knocked about and buffeted as I had been, when the superior told me that, in spite of the inscription over the doors of their convents, "Clausura per le donna," I might build a house on the spot where I stood, and bring whom I pleased there, it instantly brought to my mind the beautiful birds of paradise of De Lamartine, and my engagements with my friend the consul at Caïpha. The whole of the fraternity accompanied me down the side of the mountain; and I beg to except them all, including the cook, from any thing I may have said bearing harshly upon the monastic character. The recollection of my engagement, however, began to hurry me. The friars were puffy and shortwinded; one by one they bade me good bye; and the cook, a most deserving brother, and unnaturally lean for his profession and position in the convent, was the only one who held out to the foot of the mountain. I crossed his hand with a piece of money; Paul kissed it; and, after we had started, turned his head and cried out to the holy cook, "Orate pro mihi!"—"Pray for me."

At Caïpha we found the consul in the street. I do not know whether he was expecting us or not; but, whether or no, I considered it my duty to apologise for having staid so long on the mountain, and accompanied him to his house. Unluckily, it was so late, that Paul said if we stopped we should be shut out from Acre; and when I looked at the sun and the distant city, I had great misgivings, but it was only for a moment. The sisters were now dressed up, and standing in a door as I passed. Their dresses were Asiatic, consisting, from the waist downward, of a variety of wrappers, the outermost of which was silk, hiding the most beautiful figures under a mere bundle of habits. I went into the

room, and took a glass of lemonade with my watch in my hand. I would not speak of her in the morning, but now, in full dress, the interesting mother, so glowingly described by M. de Lamartine, appeared in a costume a great deal beyond what is usually called low in the neck. I do not mention it as a reproach to her, for she was an Arab woman, and it was the custom of her country; and as to the young ladies—M. de Lamartine had never been in America.

I had intended this for a day of rest; but I had, if possible, a harder task than on the preceding day to reach the city before the gates were closed. We pushed our donkeys till they broke down, and then got off and whipped them on before us. It was like the Irishman working his passage by hauling the tow-line of the canal boat; if it was not for the name of the thing, we might as well have walked; and when I lay down that night in my cell in the convent, I prayed that age might temper enthusiasm; that even the imagination of M. de Lamartine might grow cool; and that old men would pay respect to their lawful wives, and not go in ecstasies about young girls.

#### CHAPTER XXXVII.

St Jean d'Acra.—Extortions of the Pacha.—Tyra.—Questionable Company.—Lady Esther Stanhope.—Departure from the Holy Land.—Conclusion.

I SHALL say but little of Acra. The age of chivalry is gone for ever, but there is a green spot in every man's memory, a feeble but undying spark of romance in every heart; and that man's feelings are not to be envied who could walk on the ramparts of St Jean d'Acra without calling up Richard and Saladin, the crusaders and the Saracens; and when the interval of centuries is forgotten, and the imagination is revelling in the scenes of days long passed away, his illusion rises to the vividness of reality as he sees dashing by him a gallant array of Turkish horsemen, with turbans and glittering sabres, as when they sallied forth to drive back from the walls the chivalry of Europe. Near the city is a mount which is still called Richard Cœur de Lion, and from which Napoleon, pointing to the city, said to Murat, "The fate of the East depends upon yonder petty town." Constantinople and the Indies, a new empire in the East, and a change in the face of the whole world! Eight times he led his veteran soldiers to the assault; eleven times he stood the desperate sallies of the Mameluke sabres. British soldiers under Sir Sydney Smith came to the aid of the besieged; the ruins of a breached wall served as a breastwork, the muzzles of British and French muskets touched each other, and the spearheads of their standards were locked together. The bravest of his officers were killed, and the bodies of the dead soldiers lying around putrid under the burning sun. The pacha (Djezzar the Butcher) sat on the floor of his palace, surrounded by a heap of gory heads, distributing money to all who brought in the heads of Frenchmen; and he who was destined to overturn every throne in Europe was foiled under the walls of Acra. Three years ago it sustained, under Abdallah Pacha, a long and bloody siege from Ibrahim Pacha, and when it fell into his hands, was given up to pillage and the flames. It has since been rebuilt, fortified with skill and science, and is now almost impregnable; full of the elite of the Egyptian army, under Colonel Sève (formerly aid to Marshal Ney), now Suliman Pacha, and constantly stored with five years' provisions. The pacha has lately been building fine hospitals for his soldiers, and an Italian apothecary, licensed to kill *secundum artem*, is let loose upon the sick at the low rate of a hundred dollars per annum.

I was so much pleased with the old Arab muleteer who went with me to Mount Carmel, that I hired his donkeys again for another journey. He was an old Egyptian from Damietta; four of his children had been taken for soldiers, and he and his old wife and three donkeys followed them about wherever they went. He

had had two wives and sixteen children, and these were all that were left. They were all now stationed at Acra, and when we started, two of them, not on duty at the time, were with the old man at the convent, arranging the baggage while he was taking his coffee and pipe; they accompanied us to the gate, received the old man's benediction, and returned.

A short distance from the gate we met a Turkish grandee, with his officers, slaves, and attendants. He had formerly been a collector of taxes under Abdallah Pacha, and would have done well as an office-holder under a civilised government, for he had abandoned the falling fortunes of his master in time to slip into the same office under his successor.

Looking back, Acra appeared to much better advantage than from the other side, and the mosque and minaret of Abdallah Pacha were particularly conspicuous. We rode for some distance by the side of an aqueduct, which conveys water from the mountains twenty miles distant to the city of Acra. In the plain towards Acra two upright pillars, in which the water rose and descended, formed part of the aqueduct. Our road lay across a plain, and several times we picked up musket balls and fragments of bombs, left there by the French and Napoleon. We passed two palaces of Abdallah Pacha, where the haughty Turk had revelled with his fifty or a hundred wives in all the luxuries of the East. The plain was very extensive, naturally rich, but almost entirely uncultivated. Over an extent of several miles we would perhaps see a single Arab turning up what on the great plain appeared to be merely a few yards; and the oppressive nature of the government is manifest from the fact that, while the whole of this rich plain lies open to any one who chooses to till it, hundreds prefer to drag out a half-starved existence within the walls of Acra; for the fruit of their labour is not their own, and another will reap where they sow; the tax-gatherer comes and looks at the products, and takes not a fifth, or a sixth, nor any other fixed proportion, but as much as the pacha needs; and the question is not how much he shall take, but how little he shall leave. Taxation, or rather extortion, for it is wrong to call it by so mild a name, from cantars of olives down to single eggs, grinds the Arab to the dust; and yet, said the old man, even this is better than our lot under the sultan; even this we could bear, if the pacha would only spare us our children.

Along this plain we passed a large house, in a garden of oranges, lemons, almonds, and figs, with a row of cypress-trees along the road, formerly the residence of the treasurer of Abdallah Pacha. He himself had been a great tyrant and oppressor, and had fallen into the hands of a greater, and now wanders, with both his eyes out, a beggar in the streets of Cairo.

In about five hours we came upon the sea, on a bold point projecting out like Carmel, the white promontory of Pliny, the ancient Scala of the Syrians. On this point stood an old khan, and we sat down under the shadow of the wall for our noonday lunch. From here, too, the view was exceedingly fine. On the left were Acra and Mount Carmel; on the right the Turkish city of Sour, the ancient Tyre; and, in front, the horizon was darkened by the island of Cyprus. Almost at my feet was the wreck of a schooner, driven on the rocks only the night before, her shivered sails still flying from the masts, and the luckless mariners were alongside in a small boat bringing ashore the remnant of the cargo. Near me, and, like me, looking out upon the movements of the shipwrecked sailors, and apparently bemoaning his own unhappy lot, was a long, awkward, dangling young man, on his way to Acra; sent by the sheik of his village to work in Ibrahim Pacha's factory for three rolls of bread a-day. I asked him why he did not run away, but where could he go? If he went to a strange village, he would immediately be delivered up on the never-failing demand for soldiers. There was no help for him. He did not know that there were other lands, where men were free; and if he had known it, the curse of poverty rested upon him, and bound him where

he was. I had seen misery in Italy, Greece, Turkey, Russia, and gallant, but conquered and enslaved Poland, but I saw it refined and perfected under the iron despotism of Mohammed Ali.

From hence the road continued, for about two hours, over a rocky precipice overhanging the sea, and so narrow that as I sat on my horse, I could look down the steep and naked sides into the clear water below. In one place were the ruins of an old wall, probably, when the city before me was in its glory, defending the precipice. In the narrowest place we met a caravan of camels, and from here descended into a sandy plain, and passing small rivulets and ruins of castles or fortresses, came to a fine stream, on the banks of which were soldiers' barracks; the horses, with their gay accoutrements, were tied near the doors of the tents, constantly saddled and bridled, and strains of military music were swelling from a band among the trees.

Near this are what are called Solomon's cisterns, supposed to have been built by King Solomon in payment for the materials furnished by Hiram, king of Tyre, towards the building of the temple. Circumstances, however, abundantly prove that these cisterns, and the aqueduct connecting them with Tyre, have been built since the time of Alexander the Great.

On the extreme end of a long, low, sandy isthmus, which seems to have crawled out as far as it could, stands the fallen city of Tyre, seeming, at a distance, to rest on the bosom of the sea. A Turkish soldier was stationed at the gate. I entered under an arch, so low that it was necessary to stoop on the back of my horse, and passed through dark and narrow streets, sheltered by mats stretched over the bazaars from the scorching heat of a Syrian sun. A single fishing-boat was lying in the harbour of "the crowning city, whose merchants were princes, whose traffickers were the honourable of the earth!"

I left the gate of Tyre between as honest a man and as great a rogue as the sun ever shone upon. The honest man was my old Arab, whom I kept with me in spite of his bad donkey; and the rogue was a limping, sore-eyed Arab, in an old and ragged suit of regimentals, whom I hired for two days to relieve the old man in whipping the donkeys. He was a dismissed soldier, turned out of Ibrahim Pacha's army as of no use whatever, than which there could not be a stronger certificate of worthlessness. He told me, however, that he had once been a man of property, and, like honest Dogberry, had had his losses; he had been worth sixty piasters (nearly three dollars), with which he had come to live in the city; and been induced to embark in enterprises that had turned out unfortunately, and he had lost his all.

On my arrival at Sidon I drove immediately to the Arab consular agent, to consult him about paying a visit to Lady Esther Stanhope. He told me that I must send a note to her ladyship, requesting permission to present myself, and wait her pleasure for an answer; that sometimes she was rather capricious, and that the English consul from Beyroot had been obliged to wait two days. The state of my health would not permit my waiting any where upon an uncertainty. I was but one day from Beyroot, where I looked for rest and medical attendance; but I did not like to go past, and I made my application perhaps with more regard to my own convenience and feelings than the respect due

to those of the lady. My baggage, with my writing materials, had not yet arrived. I had no time to lose; the Arab agent gave me the best he had; and writing a note about as "big as a book" on a piece of coarse Arab paper with a reed pen, and sealing it with a huge Arab wafer, I gave it to a messenger, and, tumbling him out of the house, told him he must bring me an answer before daylight the next morning. He probably reached Lady Stanhope's residence about nine or ten o'clock in the evening; and I have no doubt he tumbled in, just as he had been tumbled out at Sidon, and, demanding an immediate answer, he got one forthwith, "Her ladyship's compliments," &c.; in short, somewhat like that which a city lady gives from the head of the stairs, "I'm not at home." I have since read M. de Lamartine's account of his visit to her ladyship, by which it appears that her ladyship had regard to the phraseology of a note. Mine, as near as I can recollect it, was as follows:—"Mr S., a young American, on the point of leaving the Holy Land, would regret exceedingly being obliged to do so without first having paid his respects to the Lady Esther Stanhope. If the Lady Esther Stanhope will allow him that honour, Mr S. will present himself to-morrow, at any hour her ladyship will name." If the reader will compare this note with the letter of M. de Lamartine, he will almost wonder that my poor messenger, demanding, too, an immediate answer, was not kicked out of doors. My horses were at the door, either for Beyroot or her ladyship's residence; and when obliged to turn away from the latter, I comforted myself with a good gallop to the former. Her ladyship was exceedingly lucky, by the way, in not having received me; for that night I broke down at Beyroot; my travels in the East were abruptly terminated; and after lying ten days under the attendance of an old Italian quack, with a blue frock coat and great frog buttons, who frightened me to death every time he approached my bedside, I got on board the first vessel bound for sea, and sailed for Alexandria. At Beyroot I received a letter from the friend who had taken me on board his boat at Thebes, advising me of the sickness of his lady, and that he had prevailed upon the English doctor at Beyroot to accompany him to Damascus and Baalbeck; here, too, I heard of the death of Mr Lowell, a gentleman from Boston, who had preceded me in many parts of my tour in the East; and who had every where left behind him such a name that it was a pleasure for an American to follow in his steps; and here, too, I heard of the great fire, which, by the time it reached this distant land, had laid the whole of my native city in ruins. In the midst of my troubles, however, I had three things that gave me pleasure. I met here my two friends with whom I had mounted the cataracts of the Nile, one of whom I hope one day to see in my own country; I received from the Austrian consul an assurance that the passport of my Jew friend at Hebron should be made out, and delivered forthwith to his friend there. For ten days I lay on the deck of a little Austrian schooner, watching the movements of a pair of turtle doves; and on the morning of the eleventh I was again off the coast of Egypt, and entering the harbour of Alexandria. Here I introduced myself to the reader; and here, if he have not fallen from me by the way, I take my leave of him, with thanks for his patient courtesies.

## NOTE.

By the arrival in America of my friend Mr Gliddon of Cairo, of whom mention has been several times made in the foregoing pages, the author has received the following notice of the Egyptian Society. The objects of the society are sufficiently explained in the notice; and they are such as cannot fail to recommend themselves to all who feel any interest in Egypt, and the East generally. The author is personally acquainted with many of the members, particularly with Mr Walne, Hon. Sec., who, besides being a gentleman of high literary and professional attainments, has devoted much attention, and with great success, to the study of hieroglyphics and Egyptian antiquities; and the author feels great satisfaction in being permitted to say that any individual, or literary or scientific institution, may, without further introduction, correspond with Dr Walne in relation to any of the objects set forth in the notice.

## NOTICE OF THE EGYPTIAN SOCIETY.

The impulse of modern discovery has excited a general and increasing interest respecting the antiquities of Egypt, while the unusual facilities of access both from India and Europe, coupled with the internal tranquillity of the country, are more than ever calculated to induce travellers to visit the Valley of the Nile, and examine personally the extraordinary monuments with which its banks abound.

By the munificence of his highness the viceroy, Cairo will, it is presumed, possess, at no distant period, a museum that, in Egyptian antiquities, may be expected to rival all existing collections. But the stranger visiting the capital, removed from those conveniences to which he has been accustomed in European cities, has particularly to regret the absence of a public library of reference, so essential to his researches.

The want of an institution that should at once offer this desirable resource, serve as a point of union for social intercourse, and be a medium for obtaining additional information relative to Egypt and the adjacent countries, has long been felt: and it is a desire of supplying this deficiency that has suggested the formation of the Egyptian Society.

The objections of the association are:—

*First*, To form a rendezvous for travellers, with the view of associating literary and scientific men who may from time to time visit Egypt.

*Second*, To collect and record information relative to Egypt, and to those parts of Africa and Asia which are connected with or tributary to this country.

*Third*, To facilitate research, by enabling travellers to avail themselves of such information as may be in the power of the society to obtain, and by offering them the advantage of a library of reference containing the most valuable works on the East. The Egyptian Society is open to gentlemen of all nations, and is composed of Members, Honorary Members, and associate Members.

*Members*.—The Members (the number of whom is at present limited to twenty) are the trustees of the institution, direct the disposal of the funds, and have the general government of the society. To be eligible as a Member, a gentleman must have been at least one year an Associate Member, and be recommended in writing by three Members. The election must take place at a general meeting, and be by ballot, one black ball to exclude.

Members pay an annual subscription of one guinea; but those elected after the 25th March, 1837, will pay in addition an admission fee of one guinea.

The contribution of ten guineas at once constitutes a Life Member.

*Honorary Members*.—Honorary Members will be elected only

from literary and scientific men, who have particularly distinguished themselves in relation to Egypt, or from gentlemen who have especially promoted the objects and interests of the society.

*Associate Members*.—With the exception of taking a part in the government of the society, Associate Members enjoy the same privileges as the Members.

To be eligible as an Associate Member, a gentleman, if not usually resident in, must at least have visited Egypt, and have passed two months either in this country, or in those parts of Africa and Asia which are immediately connected with or tributary to it. It is necessary that he be recommended in writing by two Members: the election must take place at a general meeting, and be by ballot, two black balls to exclude. Associate Members pay an annual subscription of one guinea. The contribution of five guineas at once constitutes a Life Associate Member.

*Honorary Officers*.—The President, Treasurer, Secretary, and council of management, are annually elected from the Members.

The funds arising from subscriptions and donations will be applied, as far as possible, to the formation of a library, to which the Members and Associate Members can always have free access, and to which travellers can be introduced, till such time as they become eligible to join the society. Rooms have been opened, the association possesses the nucleus of a library, and the members have every reason to hope that, by their own exertions, and with the assistance of those who take an interest in the institution, they will soon succeed in forming a collection that, while it includes many interesting volumes on the East in general, may contain the works of all the ancient and modern authors who have made Egypt the subject of their observations.

ALFRED T. WALNE, Hon. Sec.

Cairo, July 9, 1836.

Since the above was in type, the author has been favoured with a communication from the Egyptian Society, by which it appears that the objects of the society have been duly appreciated, and that it is now established upon a foundation calculated to render it eminently useful to those who may visit Egypt for the purpose of antiquarian, literary, or scientific research; but the particular favour which the author has to acknowledge now, is the interesting information that Colonel Vyse (before referred to as engaged in exploring the pyramids) has discovered no less than three new chambers over the king's chamber in the great pyramid, which he calls by the names of Wellington, Nelson, and Lady —. The last is remarkable as containing the following cartouche.

Rossellini, a learned Italian, now editing a second edition of Champollion's works, who found this cartouche in one of the tombs, reads it "Seamphis." This establishes the fact that the pyramids were not built anterior to the use of hieroglyphics, and also that Suphis or Saophis, was the builder, as stated by Manetho, according to Mr Wilkinson's table, about 2120 years B. C. The particulars of this interesting discovery, and the details connected with the present exploring of the pyramids, will probably soon be given to the public through Mr Wilkinson.

END OF INCIDENTS OF TRAVEL IN EGYPT, &c.

PEOPLE'S EDITION.

# LIFE AND TRAVELS OF MUNGO PARK.

## EARLY LIFE.

MUNGO PARK was born, on the 10th September 1771, at Fowlshiels, a farm held by his father on the estate of the Duke of Buccleugh in Selkirkshire, and situated not far from Selkirk, a small burgh town in the south of Scotland. The elder Park, who bore the same name which his son afterwards rendered so illustrious, had a family of thirteen children, of whom the subject of this memoir was the seventh in order of birth. The mother of this numerous offspring was named Hislop, and was a woman of remarkable sense and prudence. Her husband died, after a long and exemplary career, in the year 1792.

The early education of Mungo Park was received in his father's house of Fowlshiels, where a private tutor was for some years employed. The legends of border daring and chivalry, with which his ear was in these juvenile days familiar, and of which he retained in after times a vivid impression, may have had some influence in instilling into his young mind that love of adventure which modified so strongly the tenor of his life. After acquiring the ordinary rudiments of education at home, mingled with the traditional lore alluded to, Mungo was removed to the grammar school of Selkirk, at which he remained for several years, and distinguished himself above all his boyish compeers by his application and success in his studies. At this, as at every other period of his life, he was noted for the modest gravity, and even reserve, of his manners and disposition. He was fond of reading and solitude, and used to indulge these propensities conjointly, by long companionless rambles on the banks of his native Yarrow. In Mungo Park's reserve of temperament, however, no suspiciousness or hauteur was ever observed to mingle; and, with all his quiet thoughtfulness, occasional gleams of spirit and ambition were seen to burst forth, indicative of the latent fire that burned beneath his cold and composed exterior.

Though intended originally for the church, Mungo, on reaching the age of fifteen, showed a decided preference for the medical profession, and was apprenticed, in consequence, to Mr Thomas Anderson, a respectable surgeon in Selkirk. After spending three years under this gentleman's charge, Park, in the autumn of 1789, went to Edinburgh, and began the usual course of professional study at the University of that city.\* Upon the whole, little is known respecting his college life, excepting that he showed, during his three years' attendance on the medical classes, a marked predilection for botanical pursuits. Fortunately, his brother-in-law, Mr James Dickson, was a person peculiarly qualified to assist Park in his prosecution of the science in question, the knowledge of which proved afterwards so useful. Though filling originally the situation of a labouring

\* He not only proved a diligent student in the way of his profession, but evinced, at various times, a very considerable degree of literary taste. We have been informed that on one occasion he was a candidate for a medal, offered for the best poem on the comparative merits of Allan Ramsay and Robert Fergusson. The prize was awarded by the votes of a society, and Mungo stood second by the decision. But the winner's personal popularity, it was very generally admitted, was the cause of his success—Park's being much the better poem, in the estimation of those most capable of judging. Such a circumstance as this is scarcely worthy of notice, except in so far as it testifies to the general ability displayed in youth by the subject of this memoir.

gardener, Mr Dickson had raised himself into considerable distinction as a botanist, both in Edinburgh and London, to which latter city he had gone in the humble capacity alluded to. When resident there, his professional skill and enthusiasm had procured for him the notice of Sir Joseph Banks; and this circumstance enabled Mr Dickson to do his young relative a still greater favour than even the furtherance given to his studies in natural history. After Park had completed his term of attendance at the University, and had procured his surgical diploma, he went to London, in the hope of obtaining some employment either at home or abroad. A recommendation which he bore with him from Mr Dickson to Sir Joseph Banks, procured the young surgeon the object of his wish. By Sir Joseph's interest, Park received, shortly after his application, the appointment of assistant medical officer on board of the Worcester East Indiaman—in which vessel he sailed for the East Indies in the month of February 1792. Having made a voyage to Bencoolen, in the island of Sumatra, he returned to England in the following year. Park brought with him many proofs of the ardour with which he had pursued, during his absence, his favourite scientific studies. To Sir Joseph Banks he presented some rare and valuable specimens of plants which he had discovered abroad; and he communicated to the Linnean Society a paper, describing several hitherto unobserved fishes of the Indian seas. This contribution was afterwards published in the society's Transactions. These, and various other observations of importance, made by Park on his voyage, confirmed him in the favour and friendship of Sir Joseph Banks, and led to habits of frequent intercourse between them, as well as to the introduction of the young Scotsman into the society of all the eminent scientific men of the day in the metropolis. This was, doubtless, of great influence in arousing Park's thirst for distinction, and directing his mind to loftier objects than any within the scope of his professional pursuits. Nor did any length of time elapse, after his return to England in 1793, ere these ambitious views assumed a definite form and aim; and this was brought about chiefly by certain circumstances which had taken place in the scientific world shortly before this period.

A number of distinguished individuals in Britain, some years prior to Mungo Park's Indian voyage, had formed themselves into an association for the purpose of promoting discoveries in Africa, the interior of which remained almost entirely a blank in modern geography. Indeed, the knowledge of the civilised world upon the subject of the African continent, was actually more extended and more accurate two thousand years back, than it was towards the close of the eighteenth century. This stigma the founders of the African Association proposed to wipe away; and, as it proved, the hour, and the man for the task, soon came. Under the auspices of the society, Mungo Park undertook the task of penetrating into the interior of Africa. The great light which he threw upon this long obscure subject, will best appear from the records of his travels. Full justice, however, cannot be done to his exertions, unless some explanation be given of the actual state of our knowledge respecting African geography, previous to his entrance on the field of discovery.

Herodotus, the oldest historian of ancient Greece, and who flourished between two and three thousand

years ago, describes a large inland river of Africa, named the Niger, which flowed, according to his account, from *west to east*—that is, from the western coast into the centre of the country. Of the existence of this stream, Herodotus was made aware by the personal communications of some travellers belonging to the northern regions of the African continent, and who stated themselves to have seen the river in question. Several succeeding writers confirmed the relation of Herodotus; but the geographers of the middle ages, and particularly certain Arab writers, denied the existence of any large river in the interior of Africa, with such a course as that ascribed to the Niger. They admitted that a river of that name existed, but described it as flowing from *east to west*. As two large streams, the Gambia and Senegal, do really flow from the interior into the sea in this direction, at the part of Africa in question, it appeared an easy solution of the matter to regard the course, and even the existence, of the Niger as altogether a mistake, springing out of some confused notions relative to one or other of the two streams alluded to. This conclusion was, in reality, the one adopted by the majority of the geographers of the eighteenth century, though some of the most distinguished, such as D'Anville and Rennel, were inclined to put faith in the statement of Herodotus. The vast breadth of the African continent from west to east, more especially in its central latitudes, together with the absence of any visible outlet on the eastern coast, constituted the main argument against admitting the existence of a large inland river, with the course attributed to the Niger. The Nile was the only stream issuing from the interior of the continent, with such a mass of waters, and with such a course, as to permit the possibility of some one of its upper streams being regarded as the river called the Niger. Herodotus himself was of opinion that the Niger was identical with the Nile; and, upon the whole, this was the belief most generally entertained by those of the moderns who allowed the Niger's existence. But so many difficulties opposed this identification of the two rivers, that the greater number of the geographers of the eighteenth century preferred, as has been said, to regard the story of the Niger as altogether fabulous, or, at the least, as founded in mistake. Such was the uncertainty in which this matter was involved; and the same ignorance prevailed with respect to other particulars connected with the African continent. The character of the interior, its products, and its people, were all points wrapt in the profoundest mystery, and were the subject of frequent and earnest disputations.

Nor are these questions to be viewed in the light of mere objects of scientific curiosity; they were questions of the deepest general interest to humanity, and their solution of the highest consequence to the ultimate spread of civilisation over the earth. How much Mungo Park did to solve them, the sequel of this work will sufficiently show. The enlightened society under whose auspices he entered on the enterprise of African discovery, had sent out several travellers on the same mission, previous to their employment of him. John Ledyard, a man with some oddities in his character, but with high physical and mental endowments for the task, undertook, at the society's request, to penetrate into the interior of Africa, by way of Egypt. He died, however, at Cairo, ere his journey was well begun. Shortly after, Mr Lucas made a similar attempt, in a more westerly quarter of the north of Africa, but succeeded only in entering the interior to the distance of five days' journey southward of Tripoli. Another adventurer, Major Houghton, made the endeavour to accomplish the same enterprise by ascending the Gambia. After suffering severely from the natives (Moors), he died at Jarra, a town in the district of Ludamar, about half way between the coast and Lake Dabbie. His fate was unknown, until ascertained by Park.

All has now been said that seems necessary to explain the position of matters at the time when Mungo Park presented himself to the African Association, and offered his services to promote the great objects the body

had in view. No ordinary degree of boldness and ardour of spirit was necessary to prompt such an offer, after the unhappy end of Ledyard, and the disappearance of Major Houghton only two years before. Park's motives for making the offer are affectingly described by himself, in the first chapter of his travels. After some inquiries into his qualifications, the association readily agreed to make use of his services. From the strength, vigour, and hardihood of his frame, as well as from his mental qualities (though these were, as yet, but partially known), he was, indeed, as fit a man for their purpose as probably ever breathed.

It was not, however, until the summer of 1795, that all things were in readiness for Park's departure. With the exception of a brief sojourn with his relatives in Scotland, the interval was spent by him in London, chiefly in acquiring the knowledge, and making the preparations, necessary for the prosecution of his perilous enterprise. The association had determined upon the same route for him as that which Major Houghton had attempted—the ascent, to wit, of the Gambia, which seemed, undoubtedly, the shortest path to the regions to be explored. All instructions being received, and every preparation completed, in May 1795, Park took his leave of England. His own narrative, which follows in an entire form, will give the history of his adventures up to the period of his return from this his first journey.

## TRAVELS IN THE INTERIOR OF AFRICA.

### CHAPTER I.

The Author's Motives for undertaking the Voyage—His Instructions and Departure—Arrives at Jillifree, on the Gambia River—Proceeds to Vintain.—Some Account of the Feloops.—Proceeds up the River for Jonkakonda.—Arrives at Dr Laidley's.—Some Account of Pisanía, and the British Factory established at that place.—The Author's Employment during his stay at Pisanía—His Sickness and Recovery—The Country described—Prepares to set out for the Interior.

SOON after my return from the East Indies in 1793, having learned that the noblemen and gentlemen associated for the purpose of prosecuting discoveries in the interior of Africa, were desirous of engaging a person to explore that continent, by the way of the Gambia river, I took occasion, through means of the President of the Royal Society, to whom I had the honour to be known, of offering myself for that service. I had been informed, that a gentleman of the name of Houghton, a captain in the army, and formerly fort-major at Goree, had already sailed to the Gambia, under the direction of the association, and that there was reason to apprehend he had fallen a sacrifice to the climate, or perished in some contest with the natives. But this intelligence, instead of deterring me from my purpose, animated me to persist in the offer of my services with the greater solicitude. I had a passionate desire to examine into the productions of a country so little known, and to become experimentally acquainted with the modes of life, and character of the natives. I knew that I was able to bear fatigue; and I relied on my youth, and the strength of my constitution, to preserve me from the effects of the climate. The salary which the committee allowed was sufficiently large, and I made no stipulation for future reward. If I should perish in my journey, I was willing that my hopes and expectations should perish with me; and if I should succeed in rendering the geography of Africa more familiar to my countrymen, and in opening to their ambition and industry new sources of wealth, and new channels of commerce, I knew that I was in the hands of men of honour, who would not fail to bestow that remuneration which my successful services should appear to them to merit. The committee of the association having made such inquiries as they thought necessary, declared themselves satisfied with the qualifications that I possessed, and accepted me for the service; and, with that liberality which on all occasions distinguishes their conduct, gave me every encourage-

ment which it was in their power to grant, or which I could with propriety ask.

It was at first proposed that I should accompany Mr James Willis, who was then recently appointed consul at Senegambia, and whose countenance in that capacity, it was thought, might have served and protected me; but government afterwards rescinded his appointment, and I lost that advantage. The kindness of the committee, however, supplied all that was necessary. Being favoured by the secretary of the association, the late Henry Beaufoy, Esq., with a recommendation to Dr John Laidley (a gentleman who had resided many years at an English factory on the banks of the Gambia), and furnished with a letter of credit on him for £200, I took my passage in the brig Endeavour—a small vessel trading to the Gambia for bees' wax and ivory, commanded by Captain Richard Wyatt—and I became impatient for my departure.

My instructions were very plain and concise. I was directed, on my arrival in Africa, "to pass on to the river Niger, either by the way of Bambouk, or by such other route as should be found most convenient—that I should ascertain the course, and, if possible, the rise and termination, of that river—that I should use my utmost exertions to visit the principal towns or cities in its neighbourhood, particularly Tombuctoo and Houssa—and that I should be afterwards at liberty to return to Europe, either by the way of the Gambia, or by such other route, as under all the then existing circumstances of my situation and prospects should appear to me to be most advisable."

We sailed from Portsmouth on the 22d day of May 1795. On the 4th of June, we saw the mountains over Mogadore, on the coast of Africa; and on the 21st of the same month, after a pleasant voyage of thirty days, we anchored at Jillifree, a town on the northern bank of the river Gambia, opposite to James's Island, where the English had formerly a small fort.

The kingdom of Barra, in which the town of Jillifree is situated, produces great plenty of the necessaries of life; but the chief trade of the inhabitants is in salt—which commodity they carry up the river in canoes as high as Barraconda, and bring down in return Indian corn, cotton cloths, elephants' teeth, small quantities of gold dust, &c. The number of canoes and people constantly employed in this trade, makes the king of Barra more formidable to Europeans than any other chieftain on the river; and this circumstance probably encouraged him to establish those exorbitant duties, which traders of all nations are obliged to pay at entry, amounting to nearly £20 on every vessel, great and small. These duties, or customs, are generally collected in person by the Alkaid, or Governor of Jillifree, and he is attended on these occasions by a numerous train of dependents, among whom are found many who, by their frequent intercourse with the English, have acquired a smattering of our language: but they are commonly very noisy, and very troublesome—begging for every thing they fancy with such earnestness and importunity, that traders, in order to get quit of them, are frequently obliged to grant their requests.

On the 23d we departed from Jillifree, and proceeded to Vintain, a town situated about two miles up a creek on the southern side of the river. This place is much resorted to by Europeans, on account of the great quantities of bees' wax which are brought hither for sale: the wax is collected in the woods by the Feloops, a wild and unsocial race of people. Their country, which is of considerable extent, abounds in rice; and the natives supply the traders, both on the Gambia and Cassamansa rivers, with that article, and also with goats and poultry, on very reasonable terms. The honey which they collect is chiefly used by themselves in making a strong intoxicating liquor, much the same as the mead which is produced from honey in Great Britain.

In their traffic with Europeans, the Feloops generally employ a factor, or agent of the Mandingo nation, who speaks a little English, and is acquainted with the trade of the river. This broker makes the bargain;

and, with the connivance of the European, receives a certain part only of the payment, which he gives to his employer as the whole; the remainder (which is very truly called the *cheating money*) he receives when the Feloop is gone, and appropriates to himself as a reward for his trouble.

The language of the Feloops is appropriate and peculiar; and as their trade is chiefly conducted, as hath been observed, by Mandingoes, the Europeans have no inducement to learn it.

The numerals are as follow:—

|                            |                         |
|----------------------------|-------------------------|
| One, Enory.                | Six, Footuck-Enory.     |
| Two, Sிக்கaba, or Cookaba. | Seven, Footuck-Cookaba. |
| Three, Sissaje.            | Eight, Footuck-Sissaje. |
| Four, Sibakeer.            | Nine, Footuck-Sibakeer. |
| Five, Footuck.             | Ten, Sibankonyen.       |

On the 26th we left Vintain, and continued our course up the river, anchoring whenever the tide failed us, and frequently towing the vessel with the boat. The river is deep and muddy; the banks are covered with impenetrable thickets of mangrove; and the whole of the adjacent country appears to be flat and swampy.

The Gambia abounds with fish, some species of which are excellent food; but none of them that I recollect are known in Europe. At the entrance from the sea, sharks are found in great abundance; and, higher up, alligators and the hippopotamus (or river horse) are very numerous. The latter might with more propriety be called the river-elephant, being of an enormous and unwieldy bulk, and his teeth furnish good ivory. This animal is amphibious, with short and thick legs, and cloven hoofs; it feeds on grass, and such shrubs as the banks of the river afford, boughs of trees, &c.—seldom venturing far from the water, in which it seeks refuge on hearing the approach of man. I have seen many, and always found them of a timid and inoffensive disposition.

In six days after leaving Vintain, we reached Jonkakonda, a place of considerable trade, where our vessel was to take in part of her lading. The next morning, the several European traders came from their different factories to receive their letters, and learn the nature and amount of the cargo; and the captain dispatched a messenger to Dr Laidley to inform him of my arrival. He came to Jonkakonda the morning following, when I delivered him Mr Beaufoy's letter, and he gave me a kind invitation to spend my time at his house until an opportunity should offer of prosecuting my journey. This invitation was too acceptable to be refused, and being furnished by the Doctor with a horse and guide, I set out from Jonkakonda at daybreak, on the 5th of July, and at eleven o'clock arrived at Pisanian, where I was accommodated with a room, and other conveniences, in the Doctor's house.

Pisanian is a small village in the king of Yany's dominions, established by British subjects as a factory for trade, and inhabited solely by them and their black servants. It is situated on the banks of the Gambia, sixteen miles above Jonkakonda. The white residents, at the time of my arrival there, consisted only of Dr Laidley, and two gentlemen who were brothers, of the name of Ainsley; but their domestics were numerous. They enjoyed perfect security under the king's protection, and being highly esteemed and respected by the natives at large, wanted no accommodation or comfort which the country could supply; and the greatest part of the trade in slaves, ivory, and gold, was in their hands.

Being now settled for some time at my ease, my first object was to learn the Mandingo tongue, being the language in almost general use throughout this part of Africa, and without which I was fully convinced that I never could acquire an extensive knowledge of the country or its inhabitants. In this pursuit I was greatly assisted by Dr Laidley, who, by a long residence in the country, and constant intercourse with the natives, had made himself completely master of it. Next to the language, my great object was to collect information concerning the countries I intended to visit. On this occasion I was referred to certain traders called slatees. These are free black merchants, of great con-

sideration in this part of Africa, who come down from the interior countries, chiefly with enslaved negroes for sale; but I soon discovered that very little dependence could be placed on the accounts which they gave; for they contradicted each other in the most important particulars, and all of them seemed extremely unwilling that I should prosecute my journey. These circumstances increased my anxiety to ascertain the truth from my own personal observations.

In researches of this kind, and in observing the manners and customs of the natives, in a country so little known to the nations of Europe, and furnished with so many striking and uncommon objects of nature, my time passed not unpleasantly; and I began to flatter myself that I had escaped the fever, or seasoning, to which Europeans, on their first arrival in hot climates, are generally subject. But on the 31st of July I imprudently exposed myself to the night dew, in observing an eclipse of the moon, with a view to determine the longitude of the place: the next day I found myself attacked with a smart fever and delirium; and such an illness followed, as confined me to the house during the greatest part of August. My recovery was very slow; but I embraced every short interval of convalescence to walk out, and make myself acquainted with the productions of the country. In one of those excursions, having rambled farther than usual, in a hot day, I brought on a return of my fever, and on the 10th of September I was again confined to my bed. The fever, however, was not so violent as before; and in the course of three weeks I was able, when the weather would permit, to renew my botanical excursions; and when it rained, I amused myself with drawing plants, &c. in my chamber. The care and attention of Dr Laidley contributed greatly to alleviate my sufferings; his company and conversation beguiled the tedious hours during that gloomy season, when the rain falls in torrents, when suffocating heats oppress by day, and when the night is spent by the terrified traveller in listening to the croaking of frogs (of which the numbers are beyond imagination), the shrill cry of the jackall, and the deep howling of the hyena—a dismal concert, interrupted only by the roar of such tremendous thunder as no persons can form a conception of but those who have heard it.

The country itself being an immense level, and very generally covered with wood, presents a tiresome and gloomy uniformity to the eye; but although nature has denied to the inhabitants the beauties of romantic landscapes, she has bestowed on them, with a liberal hand, the more important blessings of fertility and abundance. A little attention to cultivation procures a sufficiency of corn; the fields afford a rich pasturage for cattle; and the natives are plentifully supplied with excellent fish, both from the Gambia river and the Walli creek.

The grains which are chiefly cultivated are—Indian corn, *sea mays*; two kinds of *holcus spicatus*, called by the natives *soono* and *sanio*; *holcus niger*, and *holcus bicolor*—the former of which they have named *bassi woolma*, and the latter *bassiqui*. These, together with rice, are raised in considerable quantities; besides which, the inhabitants in the vicinity of the towns and villages have gardens which produce onions, calavances, yams, cassavi, ground nuts, pompions, gourds, water melons, and some other esculent plants.

I observed likewise, near the towns, small patches of cotton and indigo. The former of these articles supplies them with clothing, and with the latter they dye their cloth of an excellent blue colour, in a manner that will hereafter be described.

In preparing their corn for food, the natives use a large wooden mortar called a *paloon*, in which they bruise the seed until it parts with the outer covering, or husk, which is then separated from the clean corn by exposing it to the wind, nearly in the same manner as wheat is cleared from the chaff in England. The corn thus freed from the husk, is returned to the mortar, and beaten into meal, which is dressed variously in different countries; but the most common preparation of it among the nations of the Gambia, is a sort of pudding, which

they call *kouskous*. It is made by first moistening the flour with water, and then stirring and shaking it about in a large calabash, or gourd, till it adheres together in small granules, resembling sago. It is then put into an earthen pot, whose bottom is perforated with a number of small holes; and this pot being placed upon another, the two vessels are luted together, either with a paste of meal and water, or with cow's dung, and placed upon the fire. In the lower vessel is commonly some animal food and water, the steam or vapour of which ascends through the perforations in the bottom of the upper vessel, and softens and prepares the *kouskous*, which is very much esteemed throughout all the countries that I visited. I am informed, that the same manner of preparing flour is very generally used on the Barbary coast, and that the dish so prepared is there called by the same name. It is therefore probable, that the negroes borrowed the practice from the Moors.

For gratifying a taste for variety, another sort of pudding, called *nealing*, is sometimes prepared from the meal of corn; and they have also adopted two or three different modes of dressing their rice. Of vegetable food, therefore, the natives have no deficiency; and although the common class of people are but sparingly supplied with animal food, yet this article is not wholly withheld from them.

Their domestic animals are nearly the same as in Europe. Swine are found in the woods, but their flesh is not esteemed: probably the marked abhorrence in which this animal is held by the votaries of Mahomet, has spread itself among the pagans. Poultry of all kinds, the turkey excepted, is every where to be had. The guinea fowl and red partridge abound in the fields; and the woods furnish a small species of antelope, of which the venison is highly and deservedly prized.

Of the other wild animals in the Mandingo countries, the most common are the hyena, the panther, and the elephant. Considering the use that is made of the latter in the East Indies, it may be thought extraordinary that the natives of Africa have not, in any part of this immense continent, acquired the skill of taming this powerful and docile creature, and applying his strength and faculties to the service of man. When I told some of the natives that this was actually done in the countries of the East, my auditors laughed me to scorn, and exclaimed, *tobaufo fonnio!*—"a white man's lie!" The negroes frequently find means to destroy the elephant by fire-arms; they hunt it principally for the sake of the teeth, which they transfer in barter to those who sell them again to the Europeans. The flesh they eat, and consider it as a great delicacy.

The usual beast of burden in all the negro territories, is the ass. The application of animal labour to the purposes of agriculture, is nowhere adopted; the plough, therefore, is wholly unknown. The chief implement used in husbandry is the hoe, which varies in form in different districts; and the labour is universally performed by slaves.

On the 6th of October, the waters of the Gambia were at the greatest height, being fifteen feet above the high water mark of the tide, after which they began to subside—at first slowly, but afterwards very rapidly, sometimes sinking more than a foot in twenty-four hours: by the beginning of November the river had sunk to its former level, and the tide ebbed and flowed as usual. When the river had subsided, and the atmosphere grew dry, I recovered apace, and began to think of my departure—for this is reckoned the most proper season for travelling; the natives had completed their harvest, and provisions were every where cheap and plentiful.

Dr Laidley was at this time employed in a trading voyage at Jonkakonda. I wrote to him to desire that he would use his interest with the slates, or slave merchants, to procure me the company and protection of the first cofle (or caravan) that might leave Gambia for the interior country; and, in the meantime, I requested him to purchase for me a horse and two asses. A few days afterwards the Doctor returned to Pisanía, and informed me that a cofle would certainly go for

the interior in the course of the dry season; but that, as many of the merchants belonging to it had not yet completed their assortment of goods, he could not say at what time they would set out.

As the characters and dispositions of the slatees, and people that composed the caravan, were entirely unknown to me—and as they seemed rather averse to my purpose, and unwilling to enter into any positive engagements on my account—and the time of their departure being withal very uncertain, I resolved, on farther deliberation, to avail myself of the dry season, and proceed without them.

Dr Laidley approved my determination, and promised me every assistance in his power, to enable me to prosecute my journey with comfort and safety.

This resolution having been formed, I made preparations accordingly. And now, being about to take leave of my hospitable friend (whose kindness and solicitude continued to the moment of my departure\*), and to quit, for many months, the countries bordering on the Gambia, it seems proper, before I proceed with my narrative, that I should, in this place, give some account of the negro nations which inhabit the several banks of this celebrated river, and the commercial intercourse that subsists between them and such of the nations of Europe as find their advantage in trading to this part of Africa. The observations which have occurred to me on both these subjects, will be found in the following chapter.

## CHAPTER II.

Description of the Feloops, the Jaloffs, the Foulahs, and Mandingoes.—Some Account of the Trade between the Nations of Europe, and the Natives of Africa, by the way of the Gambia, and between the Native Inhabitants of the Coast and the Nations of the Interior Countries—Their mode of Selling and Buying, &c.

THE natives of the countries bordering on the Gambia, though distributed into a great many distinct governments, may, I think, be divided into four great classes—the Feloops, the Jaloffs, the Foulahs, and the Mandingoes. Among all these nations, the religion of Mahomet has made, and continues to make, considerable progress; but in most of them, the body of the people, both free and enslaved, persevere in maintaining the blind but harmless superstitions of their ancestors, and are called by the Mahomedans *kafirs*, or infidels.

Of the Feloops, I have little to add to what has been observed concerning them in the former chapter. They are of a gloomy disposition, and are supposed never to forgive an injury. They are even said to transmit their quarrels as deadly feuds to their posterity—inso-much that a son considers it as incumbent on him, from a just sense of filial obligation, to become the avenger of his deceased father's wrongs. If a man loses his life in one of those sudden quarrels which perpetually occur at their feasts, when the whole party is intoxicated with mead, his son, or the eldest of his sons (if he has more than one), endeavours to procure his father's sandals, which he wears *once a-year*, on the anniversary of his father's death, until a fit opportunity offers of revenging his fate, when the object of his resentment seldom escapes his pursuit. This fierce and unrelenting disposition is, however, counterbalanced by many good qualities—they display the utmost gratitude and affection towards their benefactors—and the fidelity with which they preserve whatever is entrusted to them is remarkable. During the present war, they have more than once taken up arms to defend our merchant vessels from French privateers; and English property, of considerable value, has frequently been left at Vintain, for a long time, entirely under the care of the Feloops, who have uniformly manifested, on such

\* Dr Laidley, to my infinite regret, has since paid the debt of nature. He left Africa in the latter end of 1797, intending to return to Great Britain by way of the West Indies; and died soon after his arrival at Barbadoes.

occasions, the strictest honesty and punctuality. How greatly is it to be wished, that the minds of a people so determined and faithful, could be softened and civilised by the mild and benevolent spirit of Christianity!

The Jaloffs (or Yaloffs) are an active, powerful, and warlike race, inhabiting great part of that tract which lies between the river Senegal and the Mandingo states on the Gambia; yet they differ from the Mandingoes, not only in language, but likewise in complexion and features. The noses of the Jaloffs are not so much depressed, nor the lips so protuberant, as among the generality of Africans; and although their skin is of the deepest black, they are considered by the white traders as the most slightly negroes in this part of the continent.

They are divided into several independent states or kingdoms, which are frequently at war, either with their neighbours, or with each other. In their manners, superstitions, and government, however, they have a greater resemblance to the Mandingoes (of whom I shall presently speak) than to any other nation; but excel them in the manufacture of cotton cloth—spinning the wool to a finer thread, weaving it in a broader loom, and dyeing it of a better colour.

Their language is said to be copious and significant, and is often learnt by Europeans trading to Senegal. I cannot say much of it from my own knowledge, but have preserved their numerals, which are these:—

|                  |                            |
|------------------|----------------------------|
| One, Wean.       | Seven, Judom Yar.          |
| Two, Yar.        | Eight, Judom Yat.          |
| Three, Yat.      | Nine, Judom Yanet.         |
| Four, Yanef.     | Ten, Fook.                 |
| Five, Judom.     | Eleven, Fook aug Wean, &c. |
| Six, Judom Wean. |                            |

The Foulahs (or Pholeys), such of them at least as reside near the Gambia, are chiefly of a tawny complexion, with soft silky hair, and pleasing features. They are much attached to a pastoral life, and have introduced themselves into all the kingdoms on the windward coast as herdsmen and husbandmen, paying a tribute to the sovereign of the country for the lands which they hold. Not having many opportunities, however, during my residence at Pisania, of improving my acquaintance with these people, I defer entering at large into their character until a fitter occasion occurs, which will present itself when I come to Bondou.

The Mandingoes, of whom it remains to speak, constitute, in truth, the bulk of the inhabitants in all those districts of Africa which I visited; and their language, with a few exceptions, is universally understood, and very generally spoken, in that part of the continent. Their numerals are these:—

|               |                              |
|---------------|------------------------------|
| One, Killin.  | Seven, Oronglo.              |
| Two, Foola.   | Eight, Sie.                  |
| Three, Sabba. | Nine, Conunta.               |
| Four, Nani.   | Ten, Tang.                   |
| Five, Loolo.  | Eleven, Tan ning Killin, &c. |
| Six, Woro.    |                              |

They are called Mandingoes, I conceive, as having originally migrated from the interior state of Manding, of which some account will hereafter be given; but, contrary to the present constitution of their parent country, which is republican, it appeared to me that the government in all the Mandingo states near the Gambia is monarchical. The power of the sovereign is, however, by no means unlimited. In all affairs of importance, the king calls an assembly of the principal men, or elders, by whose councils he is directed, and without whose advice he can neither declare war nor conclude peace.

In every considerable town there is a chief magistrate, called the *alkaid*, whose office is hereditary, and whose business it is to preserve order, to levy duties on travellers, and to preside at all conferences in the exercise of local jurisdiction and the administration of justice. These courts are composed of the elders of the town (of free condition), and are termed *palavers*;

\* In the travels of Francis Moore, the reader will find a pretty copious vocabulary of the Mandingo language, which in general is correct.

and their proceedings are conducted in the open air, with sufficient solemnity. Both sides of a question are freely canvassed, witnesses are publicly examined, and the decisions which follow generally meet with the approbation of the surrounding audience.

As the negroes have no written language of their own, the general rule of decision is an appeal to *ancient custom*; but since the system of Mahomet has made so great progress among them, the converts to that faith have gradually introduced, with the religious tenets, many of the civil institutions of the prophet; and where the Koran is not found sufficiently explicit, recourse is had to a commentary called *Al Sharra*, containing, as I was told, a complete exposition or digest of the Mahomedan laws, both civil and criminal, properly arranged and illustrated.

This frequency of appeal to written laws, with which the pagan natives are necessarily unacquainted, has given rise in their palavers to (what I little expected to find in Africa) professional advocates, or expounders of the law, who are allowed to appear and to plead for plaintiff or defendant, much in the same manner as counsel in the law courts of Great Britain. They are Mahomedan negroes who have made, or affect to have made, the laws of the prophet their peculiar study; and if I may judge from their harangues, which I frequently attended, I believe, that in the forensic qualifications of prostration and cavil, and the arts of confounding and perplexing a cause, they are not always surpassed by the ablest pleaders in Europe. While I was at Pisania, a cause was heard which furnished the Mahomedan lawyers with an admirable opportunity of displaying their professional dexterity. The case was this:—An ass belonging to a Serawoolli negro (a native of an interior country near the river Senegal) had broke into a field of corn belonging to one of the Mandingo inhabitants, and destroyed great part of it. The Mandingo having caught the animal in his field, immediately drew his knife and cut its throat. The Serawoolli thereupon called a *palaver* (or in European terms, *brought an action*) to recover damages for the loss of his beast, on which he set a high value. The defendant confessed he had killed the ass, but pleaded a *set off*; insisting that the loss he had sustained by the ravage in his corn was equal to the sum demanded for the animal. To ascertain this fact was the point at issue, and the learned advocates contrived to puzzle the cause in such a manner, that after a hearing of three days, the court broke up without coming to any determination upon it; and a second palaver was, I suppose, thought necessary.

The Mandingoes, generally speaking, are of a mild, sociable, and obliging disposition. The men are commonly above the middle size, well shaped, strong, and capable of enduring great labour; the women are good natured, sprightly, and agreeable. The dress of both sexes is composed of cotton cloth, of their own manufacture—that of the men is a loose frock, not unlike a surplice, with drawers which reach half way down the leg; and they wear sandals on their feet, and white cotton caps on their heads. The women's dress consists of two pieces of cloth, each of which is about six feet long, and three broad; one of these they wrap round the waist, which, hanging down to the ankles, answers the purpose of a petticoat—the other is thrown negligently over the bosom and shoulders.

This account of their clothing is indeed nearly applicable to the natives of all the different countries in this part of Africa; a peculiar national mode is observable only in the head dresses of the women.

Thus, in the countries of the Gambia, the females wear a sort of bandage, which they call *jalla*. It is a narrow stripe of cotton cloth, wrapped many times round, immediately over the forehead. In Bondou, the head is encircled with strings of white beads, and a small plate of gold is worn in the middle of the forehead. In Kasson, the ladies decorate their heads, in a very tasteful and elegant manner, with white sea-shells. In Kaarta and Ludamar, the women raise their hair to a great height by the addition of a pad

(as the ladies did formerly in Great Britain), which they decorate with a species of coral, brought from the Red Sea by pilgrims returning from Mecca, and sold at a great price.

In the construction of their dwelling-houses, the Mandingoes also conform to the general practice of the African nations on this part of the continent, contenting themselves with small and incommodious hovels. A circular mud wall about four feet high, upon which is placed a conical roof, composed of the bamboo cane, and thatched with grass, forms alike the palace of the king and the hovel of the slave. Their household furniture is equally simple. A hurdle of canes placed upon upright sticks, about two feet from the ground, upon which is spread a mat or bullock's hide, answers the purpose of a bed; a water jar, some earthen pots for dressing their food, a few wooden bowls and calabashes, and one or two low stools, compose the rest.

As every man of free condition has a plurality of wives, it is found necessary (to prevent, I suppose, matrimonial disputes) that each of the ladies should be accommodated with a hut to herself; and all the huts belonging to the same family are surrounded by a fence, constructed of bamboo canes, split and formed into a sort of wicker-work. The whole inclosure is called a *sirk*, or *sork*. A number of these inclosures, with narrow passages between them, form what is called a town; but the huts are generally placed without any regularity, according to the caprice of the owner. The only rule that seems to be attended to, is placing the door towards the south-west, in order to admit the sea breeze.

In each town is a large stage called the *bantang*, which answers the purpose of a public hall or town-house; it is composed of interwoven canes, and is generally sheltered from the sun by being erected in the shade of some large tree. It is here that all public affairs are transacted and trials conducted; and here the lazy and indolent meet to smoke their pipes, and hear the news of the day. In most of the towns the Mahomedans have also a *missura*, or mosque, in which they assemble and offer up their daily prayers, according to the rules of the Koran.

In the account which I have thus given of the natives, the reader must bear in mind, that my observations apply chiefly to persons of *free condition*, who constitute, I suppose, not more than one-fourth part of the inhabitants at large; the other three-fourths are in a state of hopeless and hereditary slavery, and are employed in cultivating the land, in the care of cattle, and in servile offices of all kinds, much in the same manner as the slaves in the West Indies. I was told, however, that the Mandingo master can neither deprive his slave of life, nor sell him to a stranger, without first calling a palaver on his conduct—or, in other words, bringing him to a public trial; but this degree of protection is extended only to the native or domestic slave. Captives taken in war, and those unfortunate victims who are condemned to slavery for crimes or insolvency—and, in short, all those unhappy people who are brought down from the interior countries for sale—have no security whatever, but may be treated and disposed of in all respects as the owner thinks proper. It sometimes happens, indeed, when no ships are on the coast, that a humane and considerate master incorporates his purchased slaves among his domestics; and their offspring at least, if not the parents, become entitled to all the privileges of the native class.

The preceding remarks concerning the several nations that inhabit the banks of the Gambia, are all that I recollect as necessary to be made in this place, at the outset of my journey. With regard to the Mandingoes, however, many particulars are yet to be related, some of which are necessarily interwoven into the narrative of my progress, and others will be given in a summary, at the end of my work, together with all such observations as I have collected on the country and climate, which I could not with propriety insert in the regular detail of occurrences. What remains of the present chapter will therefore relate solely to the trade which

the nations of Christendom have found means to establish with the natives of Africa, by the channel of the Gambia, and the inland traffic which has arisen, in consequence of it, between the inhabitants of the coast and the nations of the interior countries.

The earliest European establishment on this celebrated river was a factory of the Portuguese, and to this must be ascribed the introduction of the numerous words of that language which are still in use among the negroes. The Dutch, French, and English, afterwards successively possessed themselves of settlements on the coast; but the trade of the Gambia became, and continued for many years, a sort of monopoly in the hands of the English. In the travels of Francis Moore is preserved an account of the Royal African Company's establishments in this river in the year 1730; at which time, James's factory alone consisted of a governor, deputy governor, and two other principal officers; eight factors, thirteen writers, twenty inferior attendants and tradesmen; a company of soldiers, and thirty-two negro servants—besides sloops, shallops, and boats, with their crews; and there were no less than eight subordinate factories in other parts of the river.

The trade with Europe, by being afterwards laid open, was almost annihilated—the share which the subjects of England at this time hold in it, supports not more than two or three annual ships; and I am informed that the gross value of British exports is under £20,000. The French and Danes still maintain a small share, and the Americans have lately sent a few vessels to the Gambia by way of experiment.

The commodities exported to the Gambia from Europe consist chiefly of fire-arms and ammunition, iron ware, spirituous liquors, tobacco, cotton caps, a small quantity of broad cloth, and a few articles of the manufacture of Manchester; a small assortment of India goods, with some glass beads, amber, and other trifles: for which are taken in exchange slaves, gold dust, ivory, bees' wax, and hides. Slaves are the chief article, but the whole number which at this time are annually exported from the Gambia by all nations, is supposed to be under one thousand.

Most of these unfortunate victims are brought to the coast in periodical caravans; many of them from very remote inland countries, for the language which they speak is not understood by the inhabitants of the maritime districts. In a subsequent part of my work, I shall give the best information I have been able to collect concerning the manner in which they are obtained.—On their arrival at the coast, if no immediate opportunity offers of selling them to advantage, they are distributed among the neighbouring villages, until a slave ship arrives, or until they can be sold to black traders, who sometimes purchase on speculation. In the meanwhile, the poor wretches are kept constantly fettered, two and two of them being chained together, and employed in the labours of the field; and, I am sorry to add, are very scantily fed, as well as harshly treated. The price of a slave varies according to the number of purchasers from Europe, and the arrival of caravans from the interior; but in general, I reckon that a young and healthy male, from sixteen to twenty-five years of age, may be estimated on the spot from £18 to £20 sterling.

The negro slave-merchants, as I have observed in the former chapter, are called *slates*; who, besides slaves, and the merchandise which they bring for sale to the whites, supply the inhabitants of the maritime districts with native iron, sweet smelling gums and frankincense, and a commodity called *sheatoulou*, which, literally translated, signifies *tree-butter*. This commodity is extracted, by means of boiling water, from the kernel of a nut, as will be more particularly described hereafter: it has the consistence and appearance of butter, and is in truth an admirable substitute for it. It forms an important article in the food of the natives, and serves also for every domestic purpose in which oil would otherwise be used. The demand for it is therefore very great.

In payment of these articles, the maritime states

supply the interior countries with salt—a scarce and valuable commodity, as I frequently and painfully experienced in the course of my journey. Considerable quantities of this article, however, are also supplied to the inland natives by the Moors, who obtain it from the salt-pits in the Great Desert, and receive in return corn, cotton cloth, and slaves.

In thus bartering one commodity for another, many inconveniences must necessarily have arisen at first from the want of coined money, or some other visible and determinate medium to settle the balance, or difference of value, between different articles—to remedy which, the natives of the interior make use of small shells called *koneries*, as will be shown hereafter. On the coast, the inhabitants have adopted a practice which I believe is peculiar to themselves.

In their early intercourse with Europeans, the article that attracted most notice was iron. Its utility, in forming the instruments of war and husbandry, made it preferable to all others, and iron soon became the measure by which the value of all other commodities was ascertained. Thus, a certain quantity of goods, of whatever denomination, appearing to be equal in value to a bar of iron, constituted, in the trader's phraseology, a bar of that particular merchandise. Twenty leaves of tobacco, for instance, were considered as a bar of tobacco; and a gallon of spirits (or rather half spirits and half water) as a bar of rum—a bar of one commodity being reckoned equal in value to a bar of another commodity.

As, however, it must unavoidably happen, that according to the plenty or scarcity of goods at market in proportion to the demand, the relative value would be subject to continual fluctuation, greater precision has been found necessary; and at this time, the current value of a single bar of any kind is fixed by the whites at two shillings sterling. Thus, a slave whose price is £15, is said to be worth 150 bars.

In transactions of this nature, it is obvious that the white trader has infinitely the advantage over the African, whom, therefore, it is difficult to satisfy; for, conscious of his own ignorance, he naturally becomes exceedingly suspicious and wavering; and indeed so very unsettled and jealous are the negroes in their dealings with the whites, that a bargain is never considered by the European as concluded, until the purchase money is paid, and the party has taken leave.

Having now brought together such general observations on the country and its inhabitants, as occurred to me during my residence in the vicinage of the Gambia, I shall detain the reader no longer with introductory matter, but proceed, in the next chapter, to a regular detail of the incidents which happened, and the reflections which arose in my mind, in the course of my painful and perilous journey, from its commencement until my return to the Gambia.

### CHAPTER III.

The Author sets out from Pisanah—His Attendants—Reaches Jindey.—Story related by a Mandingo Negro.—Proceeds to Medina, the capital of Woolli.—Interview with the King.—Saphies or Charms.—Proceeds to Kolor.—Description of Mumbo Jumbo.—Arrives at Koojar—Wrestling Match.—Crosses the Wilderness, and arrives at Tallika, in the Kingdom of Bondou.

On the 2d of December 1795, I took my departure from the hospitable mansion of Dr Laidley. I was fortunately provided with a negro servant, who spoke both the English and Mandingo tongues. His name was Johnson. He was a native of this part of Africa; and having in his youth been conveyed to Jamaica as a slave, he had been made free, and taken to England by his master, where he had resided many years; and at length found his way back to his native country. As he was known to Dr Laidley, the Doctor recommended him to me, and I hired him as my interpreter, at the rate of ten bars monthly, to be paid to himself, and five bars a-month to be paid to his wife during his absence. Dr Laidley furthermore provided me with a

negro boy of his own, named Demba—a sprightly youth, who, besides Mandingo, spoke the language of the Serawoolies, an inland people (of whom mention will hereafter be made), residing on the banks of the Senegal; and to induce him to behave well, the Doctor promised him his freedom on his return, in case I should report favourably of his fidelity and services. I was furnished with a horse for myself (a small, but very hardy and spirited beast, which cost me to the value of £7, 10s.), and two asses for my interpreter and servant. My baggage was light, consisting chiefly of provisions for two days; a small assortment of beads, amber, and tobacco, for the purchase of a fresh supply as I proceeded; a few changes of linen, and other necessary apparel; an umbrella, a pocket sextant, a magnetic compass, and a thermometer; together with two fowling pieces, two pair of pistols, and some other small articles.

A free man (a *bushreen* or Mahomedan), named Madiboo, who was travelling to the kingdom of Bambara, and two satees, or slave merchants, of the Serawooli nation, and of the same sect, who were going to Bondou, offered their services as far as they intended respectively to proceed; as did likewise a negro named Tami (also a Mahomedan), a native of Kasson, who had been employed some years by Dr Laidley as a blacksmith, and was returning to his native country with the savings of his labours. All these men travelled on foot, driving their asses before them.

Thus I had no less than six attendants, all of whom had been taught to regard me with great respect; and to consider that their safe return hereafter, to the countries on the Gambia, would depend on my preservation.

Dr Laidley himself, and Messrs Ainsley, with a number of their domestics, kindly determined to accompany me the two first days; and, I believe, they secretly thought they should never see me afterwards.

We reached Jindey the same day, having crossed the Walli creek, a branch of the Gambia, and rested at the house of a black woman, who had formerly been the paramour of a white trader named Hewett; and who, in consequence thereof, was called, by way of distinction, *seniora*. In the evening we walked out to see an adjoining village, belonging to a satee named Jemaffoo Mamadoo, the richest of all the Gambia traders. We found him at home; and he thought so highly of the honour done him by this visit, that he presented us with a fine bullock, which was immediately killed, and part of it dressed for our evening's repast.

The negroes do not go to supper till late; and in order to amuse ourselves while our beef was preparing, a Mandingo was desired to relate some diverting stories—in listening to which, and smoking tobacco, we spent three hours. These stories bear some resemblance to those in the Arabian Nights' Entertainments; but, in general, are of a more ludicrous cast. I shall here abridge one of them for the reader's amusement.

"Many years ago," said the relator, "the people of Doomasansa (a town on the Gambia) were much annoyed by a lion, that came every night and took away some of their cattle. By continuing his depredations, the people were at length so much enraged that a party of them resolved to go and hunt the monster. They accordingly proceeded in search of the common enemy, which they found concealed in a thicket; and immediately firing at him, were lucky enough to wound him in such a manner, that, in springing from the thicket towards the people, he fell down among the grass, and was unable to rise. The animal, however, manifested such appearance of vigour, that nobody cared to approach him singly; and a consultation was held concerning the most proper means of taking him alive—a circumstance, it was said, which, while it furnished undeniable proof of their prowess, would turn out to great advantage, it being resolved to convey him to the coast, and sell him to the Europeans. While some persons proposed one plan, and some another, an old man offered a scheme. This was to strip the roof of a house of its thatch, and to carry the bamboo frame

(the pieces of which are well secured together by thongs), and throw it over the lion. If, in approaching him, he should attempt to spring upon them, they had nothing to do but to let down the roof upon themselves, and fire at the lion through the rafters.

This proposition was approved and adopted. The thatch was taken from the roof of a hut, and the lion-hunters, supporting the fabric, marched courageously to the field of battle; each person carrying a gun in one hand, and bearing his share of the roof on the opposite shoulder. In this manner they approached the enemy; but the beast had by this time recovered his strength, and such was the fierceness of his countenance, that the hunters, instead of proceeding any farther, thought it prudent to provide for their own safety, by covering themselves with the roof. Unfortunately, the lion was too nimble for them; for, making a spring while the roof was setting down, both the beast and his pursuers were caught in the same cage, and the lion devoured them at his leisure, to the great astonishment and mortification of the people of Doomasansa—at which place it is even dangerous at this day to tell the story; for it is become the subject of laughter and derision in the neighbouring countries, and nothing will enrage an inhabitant of that town so much as desiring him to catch a lion alive."

About one o'clock in the afternoon of the 3d of December, I took my leave of Dr Laidley and Messrs Ainsley, and rode slowly into the woods. I had now before me a boundless forest, and a country, the inhabitants of which were strangers to civilised life, and to most of whom a white man was the object of curiosity or plunder. I reflected that I had parted from the last European I might probably behold, and perhaps quitted for ever the comforts of Christian society. Thoughts like these would necessarily cast a gloom over my mind; and I rode musing along for about three miles, when I was awakened from my reverie by a body of people, who came running up and stopped the asses, giving me to understand that I must go with them to Peckaba, to present myself to the king of Walli, or pay customs to them. I endeavoured to make them comprehend that the object of my journey not being traffic, I ought not to be subjected to a tax like the satees, and other merchants, who travel for gain; but I reasoned to no purpose. They said it was usual for travellers of all descriptions to make a present to the king of Walli, and without doing so I could not be permitted to proceed. As they were more numerous than my attendants, and withal very noisy, I thought it prudent to comply with their demand; and having presented them with four bars of tobacco, for the king's use, I was permitted to continue my journey, and at sunset reached a village near Kootacunda, where we rested for the night.

In the morning of December 4th, I passed Kootacunda, the last town of Walli, and stopped about an hour at a small adjoining village to pay customs to an officer of the king of Woolli; we rested the ensuing night at a village called Tabajang; and at noon the next day (December 5th) we reached Medina, the capital of the king of Woolli's dominions.

The kingdom of Woolli is bounded by Walli on the west, by the Gambia on the south, by the small river Walli on the north-west, by Bondou on the north-east, and on the east by the Simbani wilderness.

The country every where rises into gentle acclivities, which are generally covered with extensive woods, and the towns are situated in the intermediate valleys. Each town is surrounded by a tract of cultivated land, the produce of which, I presume, is found sufficient to supply the wants of the inhabitants; for the soil appeared to me to be every where fertile, except near the tops of the ridges, where the red ironstone and stunted shrubs sufficiently marked the boundaries between fertility and barrenness. The chief productions are cotton, tobacco, and esculent vegetables; all which are raised in the valleys, the rising grounds being appropriated to different sorts of corn.

The inhabitants are Mandingoes; and, like most of

the Mandingo nations, are divided into two great sects—the Mahomedans, who are called *bushreens*, and the pagans, who are called indiscriminately *kajirs* (unbelievers) and *sonakies* (i. e. men who drink strong liquors.) The pagan natives are by far the most numerous, and the government of the country is in their hands; for though the most respectable among the bushreens are frequently consulted in affairs of importance, yet they are never permitted to take any share in the executive government, which rests solely in the hands of the *mansa*, or sovereign, and great officers of the state. Of these, the first in point of rank is the presumptive heir of the crown, who is called the *farbanna*; next to him are the *alkaids*, or provincial governors, who are more frequently called *keamos*. Then follow the two grand divisions of freemen and slaves;\* of the former, the *slatees*, so frequently mentioned in the preceding pages, are considered as the principal: but, in all classes, great respect is paid to the authority of aged men.

On the death of the reigning monarch, his eldest son (if he has attained the age of manhood) succeeds to the regal authority. If there is no son, or if the son is under the age of discretion, a meeting of the great men is held, and the late monarch's nearest relation (commonly his brother) is called to the government, not as regent, or guardian to the infant son, but in full right, and to the exclusion of the minor. The charges of the government are defrayed by occasional tributes from the people, and by duties on goods transported across the country. Travellers, on going from the Gambia towards the interior, pay customs in European merchandise. On returning, they pay in iron and *sheatoulou*. These taxes are paid at every town.

Medina,† the capital of the kingdom, at which I was now arrived, is a place of considerable extent, and may contain from eight hundred to one thousand houses. It is fortified in the common African manner, by a surrounding high wall built of clay, and an outward fence of pointed stakes and prickly bushes; but the walls are neglected, and the outward fence has suffered considerably from the active hands of busy housewives, who pluck up the stakes for firewood. I obtained a lodging at one of the king's near relations, who apprised me, that at my introduction to the king, I must not presume to shake hands with him. "It was not usual," he said, "to allow this liberty to strangers." Thus instructed, I went in the afternoon to pay my respects to the sovereign, and ask permission to pass through his territories to Bondou. The king's name was Jatta. He was the same venerable old man of whom so favourable an account was transmitted by Major Houghton. I found him seated upon a mat before the door of his hut: a number of men and women were arranged on each side, who were singing and clapping their hands. I saluted him respectfully, and informed him of the purport of my visit. The king graciously replied, that he not only gave me leave to pass through his country, but would offer up his prayers for my safety. On this, one of my attendants, seemingly in return for the king's condescension, began to sing, or rather to roar, an Arabic song; at every pause of which, the king himself, and all the people present, struck their hands against their foreheads, and exclaimed, with devout and affecting solemnity, *Amen, amen*! The king told me furthermore, that I should have a guide the day following, who would conduct me safely to the frontier of his kingdom. I then took my leave, and in the evening sent the king an order upon Dr Laidley for three

gallons of rum, and received in return great store of provisions.

December 6th.—Early in the morning I went to the king a second time, to learn if the guide was ready. I found his majesty sitting upon a bullock's hide, warming himself before a large fire; for the Africans are sensible of the smallest variation in the temperature of the air, and frequently complain of cold when a European is oppressed with heat. He received me with a benevolent countenance, and tenderly entreated me to desist from my purpose of travelling into the interior; telling me that Major Houghton had been killed in his route, and that if I followed his footsteps, I should probably meet with his fate. He said that I must not judge of the people of the eastern country by those of Woolli: that the latter were acquainted with white men, and respected them, whereas the people of the east had never seen a white man, and would certainly destroy me. I thanked the king for his affectionate solicitude, but told him that I had considered the matter, and was determined, notwithstanding all dangers, to proceed. The king shook his head, but desisted from farther persuasion, and told me the guide should be ready in the afternoon.

About two o'clock, the guide appearing, I went and took my last farewell of the good old king, and in three hours reached Konjour, a small village, where we determined to rest for the night. Here I purchased a fine sheep for some beads, and my Serawoolli attendants killed it with all the ceremonies prescribed by their religion. Part of it was dressed for supper, after which a dispute arose between one of the Serawoolli negroes, and Johnson, my interpreter, about the sheep's horns. The former claimed the horns as his perquisite, for having acted the part of our butcher, and Johnson contested the claim. I settled the matter by giving a horn to each of them. This trifling incident is mentioned as introductory to what follows: for it appeared on inquiry that these horns were highly valued, as being easily convertible into portable sheaths, or cases, for containing and keeping secure certain charms or amulets called *saphies*, which the negroes constantly wear about them. These saphies are prayers, or rather sentences, from the Koran, which the Mahomedan priests write on scraps of paper, and sell to the simple natives, who consider them to possess very extraordinary virtues. Some of the negroes wear them to guard themselves against the bite of snakes or alligators; and on this occasion the saphie is commonly inclosed in a snake's or alligator's skin, and tied round the ankle. Others have recourse to them in time of war, to protect their persons against hostile weapons; but the common use to which these amulets are applied, is to prevent or cure bodily diseases—to preserve from hunger and thirst—and generally to conciliate the favour of superior powers, under all the circumstances and occurrences of life.\*

In this case, it is impossible not to admire the wonderful contagion of superstition; for, notwithstanding that the majority of the negroes are pagans, and absolutely reject the doctrines of Mahomet, I did not meet with a man, whether a bushreen or kafir, who was not fully persuaded of the powerful efficacy of these amulets. The truth is, that all the natives of this part of Africa consider the art of writing as bordering on magic; and it is not in the doctrines of the prophet, but in the arts of the magician, that their confidence is placed. It will hereafter be seen that I was myself lucky enough, in circumstances of distress, to turn the popular credulity in this respect to good account.

On the 7th I departed from Konjour, and slept at a village called Malla (or Mallaing); and on the 8th about noon I arrived at Kolor, a considerable town—near the entrance into which I observed, hanging upon a tree, a sort of masquerade habit, made of the bark of trees, which I was told, on inquiry, belonged to *Mumbo Jumbo*. This is a strange bugbear, common to all the Mandingo towns, and much employed by the pagan natives in

\* The term which signifies a man of free condition is *horeca*; that of a slave, *jong*.

† Medina in the Arabic signifies a city; the name is not uncommon among the negroes, and has probably been borrowed from the Mahomedans.

‡ It may seem from hence that the king was a Mahomedan; but I was assured to the contrary. He joined in prayer on this occasion probably from the mere dictates of his benevolent mind; considering, perhaps, that prayers to the Almighty, offered up with true devotion and sincerity, were equally acceptable, whether from bushreen or pagan.

\* I believe that similar charms or amulets, under the names of *domini*, *grigri*, *felich*, &c., &c., are common in all parts of Africa.

keeping their women in subjection; for as the kafirs are not restricted in the number of their wives, every one marries as many as he can conveniently maintain—and as it frequently happens that the ladies disagree among themselves, family quarrels sometimes rise to such a height, that the authority of the husband can no longer preserve peace in his household. In such cases, the interposition of Mumbo Jumbo is called in, and is always decisive.

This strange minister of justice (who is supposed to be either the husband himself, or some person instructed by him), disguised in the dress that has been mentioned, and armed with the rod of public authority, announces his coming (whenever his services are required) by loud and dismal screams in the woods near the town. He begins the pantomime at the approach of night; and as soon as it is dark, he enters the town, and proceeds to the bentang, at which all the inhabitants immediately assemble.

It may easily be supposed that this exhibition is not much relished by the women; for as the person in disguise is entirely unknown to them, every married female suspects that the visit may possibly be intended for herself; but they dare not refuse to appear when they are summoned; and the ceremony commences with songs and dances, which continue till midnight, about which time Mumbo fixes on the offender. This unfortunate victim being thereupon immediately seized, is stripped naked, tied to a post, and severely scourged with Mumbo's rod, amidst the shouts and derision of the whole assembly; and it is remarkable, that the rest of the women are the loudest in their exclamations on this occasion against their unhappy sister. Daylight puts an end to this indecent and unmanly revel.

December 9th.—As there was no water to be procured on the road, we travelled with great expedition until we reached Tambacunda; and departing from thence early the next morning, the 10th, we reached in the evening Kooniakary, a town of nearly the same magnitude as Kolor. About noon on the 11th we arrived at Koojar, the frontier town of Woooli, towards Bondou, from which it is separated by an intervening wilderness of two days' journey.

The guide appointed by the king of Woooli being now to return, I presented him with some amber for his trouble; and having been informed that it was not possible at all times to procure water in the wilderness, I made inquiry for men who would serve both as guides and water-bearers during my journey across it. Three negroes, elephant hunters, offered their services for these purposes, which I accepted, and paid them three bars each in advance; and the day being far spent, I determined to pass the night in my present quarters.

The inhabitants of Koojar, though not wholly unaccustomed to the sight of Europeans (most of them having occasionally visited the countries on the Gambia), beheld me with a mixture of curiosity and reverence, and in the evening invited me to see a *neobering*, or wrestling match, at the bentang. This is an exhibition very common in all the Mandingo countries. The spectators arranged themselves in a circle, leaving the intermediate space for the wrestlers, who were strong active young men, full of emulation, and accustomed, I suppose, from their infancy to this sort of exertion. Being stripped of their clothing, except a short pair of drawers, and having their skin anointed with oil, or *shea butter*, the combatants approached each other on all-fours, parrying with, and occasionally extending a hand for some time, till at length one of them sprang forward, and caught his rival by the knee. Great dexterity and judgment were now displayed, but the contest was decided by superior strength; and I think that few Europeans would have been able to cope with the conqueror. It must not be unobserved, that the combatants were animated by the music of a drum, by which their actions were in some measure regulated.

The wrestling was succeeded by a dance, in which many performers assisted, all of whom were provided with little bells, which were fastened to their legs and arms; and here, too, the drum regulated their motions.

It was beaten with a crooked stick, which the drummer held in his right hand, occasionally using his left to deaden the sound, and thus vary the music. The drum is likewise applied on these occasions to keep order among the spectators, by imitating the sound of certain Mandingo sentences: for example, when the wrestling match is about to begin, the drummer strikes what is understood to signify *ali ba see*—sit all down; upon which the spectators immediately seat themselves, and when the combatants are to begin, he strikes *amuta, amuta*—take hold, take hold!

In the course of the evening I was presented, by way of refreshment, with a liquor, which tasted so much like the strong beer of my native country (and very good beer too), as to induce me to inquire into its composition; and I learnt, with some degree of surprise, that it was actually made from corn which had been previously malted, much in the same manner as barley is malted in Great Britain—a root yielding a grateful bitter was used in lieu of hops, the name of which I have forgot; but the corn which yields the wort is the *holcus spicatus* of botanists.

Early in the morning (the 12th), I found that one of the elephant hunters had absconded with the money he had received from me in part of wages; and in order to prevent the other two from following his example, I made them instantly fill their calabashes (or gourds) with water; and as the sun rose, I entered the wilderness that separates the kingdoms of Woooli and Bondou.

We had not travelled more than a mile before my attendants insisted on stopping, that they might prepare a *saphie*, or charm, to insure us a safe journey. This was done by muttering a few sentences, and spitting upon a stone, which was thrown before us on the road. The same ceremony was repeated three times, after which the negroes proceeded with the greatest confidence; every one being firmly persuaded that the stone (like the scape-goat) had carried with it every thing that could induce superior powers to visit us with misfortune.

We continued our journey without stopping any more until noon, when we came to a large tree, called by the natives *neema taba*. It had a very singular appearance, being decorated with innumerable rags or scraps of cloth, which persons travelling across the wilderness had at different times tied to the branches—probably at first to inform the traveller that water was to be found near it; but the custom has been so greatly sanctioned by time, that nobody now presumes to pass without hanging up something. I followed the example, and suspended a handsome piece of cloth on one of the boughs; and being told that either a well, or pool of water, was at no great distance, I ordered the negroes to unload the asses, that we might give them corn, and regale ourselves with the provisions we had brought. In the meantime, I sent one of the elephant hunters to look for the well, intending, if water was to be obtained, to rest here for the night. A pool was found, but the water was thick and muddy, and the negro discovered near it the remains of a fire recently extinguished, and the fragments of provisions, which afforded a proof that it had been lately visited, either by travellers or banditti. The fears of my attendants supposed the latter; and believing that robbers lurked near us, I was persuaded to change my resolution of resting here all night, and proceed to another watering place, which I was assured we might reach early in the evening.

We departed accordingly, but it was eight o'clock at night before we came to the watering place; and being now sufficiently fatigued with so long a day's journey, we kindled a large fire, and lay down, surrounded by our cattle, on the bare ground, more than a gunshot from any bush—the negroes agreeing to keep watch by turns to prevent surprise.

I know not, indeed, that any danger was justly to be dreaded; but the negroes were unaccountably apprehensive of banditti, during the whole of the journey. As soon, therefore, as daylight appeared, we filled our *soofroos* (skins) and calabashes at the pool, and set out

for Tallika, the first town in Bondou, which we reached about eleven o'clock in the forenoon (the 13th of December). I cannot, however, take leave of Woולי, without observing that I was every where well received by the natives, and that the fatigues of the day were generally alleviated by a hearty welcome at night; and although the African mode of living was at first unpleasant to me, yet I found, at length, that custom surmounted trifling inconveniences, and made every thing palatable and easy.

#### CHAPTER IV.

Some Account of the Inhabitants of Tallika.—The Author proceeds for Fatteconda.—Incidents on the Road.—Crosses the Neriko, and arrives at Koorkarany.—Reaches the River Falemé.—Fishes on that River.—Proceeds along its Bank to Naye or Nayemow.—Crosses the Falemé, and arrives at Fatteconda.—Has an Interview with Almami, the Sovereign of Bondou.—Description of the King's Dwelling.—Has a second Interview with the King, who begs the Author's Coat.—Author visits the King's Wives.—Is permitted to depart on friendly terms.—Journey by Night.—Arrives at Joag.—Some Account of Bondou, and its Inhabitants the Foulahs.

TALLIKA, the frontier town of Bondou towards Woולי, is inhabited chiefly by Foulahs of the Mahomedan religion, who live in considerable affluence, partly by furnishing provisions to the coffles, or caravans, that pass through the town, and partly by the sale of ivory, obtained by hunting elephants; in which employment the young men are generally very successful. Here an officer belonging to the king of Bondou constantly resides, whose business it is to give timely information of the arrival of the caravans, which are taxed according to the number of loaded asses that arrive at Tallika.

I took up my residence at this officer's house, and agreed with him to accompany me to Fatteconda, the residence of the king, for which he was to receive five bars; and before my departure I wrote a few lines to Dr Laidley, and gave my letter to the master of a caravan bound for the Gambia. This caravan consisted of nine or ten people, with five asses loaded with ivory. The large teeth are conveyed in nets, two on each side of the ass—the small ones are wrapped up in skins, and secured with ropes.

December 14th.—We left Tallika, and rode on very peacefully for about two miles, when a violent quarrel arose between two of my fellow-travellers, one of whom was the blacksmith, in the course of which they bestowed some opprobrious terms upon each other; and it is worthy of remark, that an African will sooner forgive a blow than a term of reproach applied to his ancestors: "Strike me, but do not curse my mother," is a common expression even among the slaves. This sort of abuse, therefore, so enraged one of the disputants that he drew his cutlass upon the blacksmith, and would certainly have ended the dispute in a very serious manner, if the others had not laid hold of him, and wrested the cutlass from him. I was obliged to interfere, and put an end to this disagreeable business, by desiring the blacksmith to be silent, and telling the other, who I thought was in the wrong, that if he attempted in future to draw his cutlass, or molest any of my attendants, I should look upon him as a robber, and shoot him without farther ceremony. This threat had the desired effect, and we marched sullenly along till the afternoon, when we arrived at a number of small villages scattered over an open and fertile plain; at one of these, called Ganado, we took up our residence for the night: here an exchange of presents and a good supper terminated all animosities among my attendants—and the night was far advanced before any of us thought of going to sleep. We were amused by an itinerant *singing man*,\* who told a number of diverting stories, and played some sweet airs by blowing his breath upon

\* These are a sort of travelling bards and musicians, who sing extempore songs in praise of those who employ them. A fuller account of them will be given hereafter.

a bow-string, and striking it at the same time with a stick.

December 15th.—At day-break my fellow-travellers, the Serawoollies, took leave of me, with many prayers for my safety. About a mile from Ganado, we crossed a considerable branch of the Gambia, called Neriko. The banks were steep and covered with mimosas; and I observed in the mud a number of large muscles, but the natives do not eat them. About noon, the sun being exceedingly hot, we rested two hours in the shade of a tree, and purchased some milk and pounded corn from some Foulah herdsmen, and at sunset reached a town called Koorkarany, where the blacksmith had some relations; and here we rested two days.

Koorkarany is a Mahomedan town, surrounded by a high wall, and is provided with a mosque. Here I was shown a number of Arabic manuscripts, particularly a copy of the book before mentioned called *Al Shara*. The *maraboo*, or priest, in whose possession it was, read and explained to me in Mandingo many of the most remarkable passages; and in return I showed him Richardson's Arabic Grammar, which he very much admired.

On the evening of the second day (December 17th) we departed from Koorkarany. We were joined by a young man who was travelling to Fatteconda for salt; and as night set in we reached Dooggi, a small village about three miles from Koorkarany.

Provisions were here so cheap that I purchased a bullock for six small stones of amber; for I found my company increase or diminish according to the good fare they met with.

December 18th.—Early in the morning we departed from Dooggi, and being joined by a number of Foulahs and other people, made a formidable appearance; and were under no apprehension of being plundered in the woods. About eleven o'clock, one of the asses proving very refractory, the negroes took a curious method to make him tractable. They cut a forked stick, and putting the forked part into the ass's mouth, like the bit of a bridle, tied the two smaller parts together above his head, leaving the lower part of the stick of sufficient length to strike against the ground, if the ass should attempt to put his head down. After this, the ass walked along quietly and gravely enough, taking care, after some practice, to hold his head sufficiently high to prevent the stones or roots of trees from striking against the end of the stick, which experience had taught him would give a severe shock to his teeth. This contrivance produced a ludicrous appearance; but my fellow-travellers told me it was constantly adopted by the slates, and always proved effectual.

In the evening we arrived at a few scattered villages, surrounded with extensive cultivation; at one of which, called Buggil, we passed the night in a miserable hut, having no other bed than a bundle of corn stalks, and no provisions but what we brought with us. The wells here are dug with great ingenuity, and are very deep. I measured one of the bucket ropes, and found the depth of the well to be twenty-eight fathoms.

December 19th.—We departed from Buggil, and travelled along a dry, stoney height, covered with mimosas, till mid-day, when the land sloped towards the east, and we descended into a deep valley, in which I observed abundance of whinstone, and white quartz. Pursuing our course to the eastward, along this valley, in the bed of an exhausted river course, we came to a large village, where we intended to lodge. We found many of the natives, dressed in a thin French gauze, which they called *bygui*; this being a light airy dress, and well calculated to display the shape of their persons, is much esteemed by the ladies. The manners of these females, however, did not correspond with their dress—for they were rude and troublesome in the highest degree; they surrounded me in numbers, begging for amber, beads, &c.; and were so vehement in their solicitations, that I found it impossible to resist them. They tore my cloak, cut the buttons from my boy's clothes; and were proceeding to other outrages, when I mounted my horse and rode off, followed for half a mile by a body of these harpies.

In the evening we reached Soobrudooka, and as my company was numerous (being fourteen), I purchased a sheep and abundance of corn for supper; after which we lay down by the bundles, and passed an uncomfortable night in a heavy dew.

December 20th.—We departed from Soobrudooka, and at two o'clock reached a large village situated on the banks of the Falemé river, which is here rapid and rocky. The natives were employed in fishing in various ways. The large fish were taken in long baskets made of split cane, and placed in a strong current, which was created by walls of stone built across the stream, certain open places being left, through which the water rushed with great force. Some of these baskets were more than twenty feet long, and when once the fish had entered one of them, the force of the stream prevented it from returning. The small fish were taken in great numbers in hand-nets, which the natives weave of cotton, and use with great dexterity. The fish last mentioned are about the size of sprats, and are prepared for sale in different ways; the most common is by pounding them entire as they come from the stream, in a wooden mortar, and exposing them to dry in the sun, in large lumps like sugar loaves. It may be supposed that the smell is not very agreeable; but in the Moorish countries to the north of the Senegal, where fish is scarcely known, this preparation is esteemed as a luxury, and sold to considerable advantage. The manner of using it by the natives is, by dissolving a piece of this black loaf in boiling water, and mixing it with their *kouskous*.

I thought it very singular, at this season of the year, to find the banks of the Falemé every where covered with large and beautiful fields of corn; but, on examination, I found it was not the same species of grain as is commonly cultivated on the Gambia—it is called by the natives *manio*, and grows in the dry season, is very prolific, and is reaped in the month of January. It is the same which, from the depending position of the ear, is called by botanical writers *holcus cernuus*.

On returning to the village, after an excursion to the river side to inspect the fishery, an old Moorish sheereff came to bestow his blessing upon me, and beg some paper to write snaphies upon. This man had seen Major Houghton in the kingdom of Kaarta, and told me that he died in the country of the Moors. I gave him a few sheets of paper, and he levied a similar tribute from the blacksmith; for it is customary for young Mussulmen to make presents to the old ones, in order to obtain their blessing, which is pronounced in Arabic, and received with great humility.

About three in the afternoon we continued our course along the bank of the river to the northward, till eight o'clock, when we reached Nayemow; here the hospitable master of the town received us kindly, and presented us with a bullock. In return, I gave him some amber and beads.

December 21st.—In the morning, having agreed for a canoe to carry over my bundles, I crossed the river, which came up to my knees as I sat on my horse; but the water is so clear, that from the high bank the bottom is visible all the way over.

About noon we entered Fatteconda, the capital of Bondou, and in a little time received an invitation to the house of a respectable sateé: for as there are no public houses in Africa, it is customary for strangers to stand at the bentang, or some other place of public resort, till they are invited to a lodging by some of the inhabitants. We accepted the offer; and in an hour afterwards, a person came and told me that he was sent on purpose to conduct me to the king, who was very desirous of seeing me immediately, if I was not too much fatigued.

I took my interpreter with me, and followed the messenger till we got quite out of the town, and crossed some corn fields; when, suspecting some trick, I stopped, and asked the guide whither he was going. Upon which he pointed to a man sitting under a tree at some little distance, and told me that the king frequently gave audience in that retired manner, in order to avoid

a crowd of people; and that nobody but myself and my interpreter must approach him. When I advanced, the king desired me to come and sit by him upon the mat; and, after hearing my story, on which he made no observation, he asked if I wished to purchase any slaves or gold: being answered in the negative, he seemed rather surprised, but desired me to come to him in the evening, and he would give me some provisions.

This monarch was called Almani—a Moorish name, though I was told that he was not a Mahomedan, but a kafir or pagan. I had heard that he had acted towards Major Houghton with great unkindness, and caused him to be plundered. His behaviour therefore towards myself at this interview, though much more civil than I expected, was far from freeing me from uneasiness. I still apprehended some double dealing; and as I was now entirely in his power, I thought it best to smooth the way by a present: accordingly, I took with me in the evening one canister of gunpowder, some amber, tobacco, and my umbrella; and as I considered that my bundles would inevitably be searched, I concealed some few articles in the roof of the hut where I lodged, and I put on my new blue coat, in order to preserve it.

All the houses belonging to the king and his family are surrounded by a lofty mud wall, which converts the whole into a kind of citadel. The interior is subdivided into different courts. At the first place of entrance, I observed a man standing with a musket on his shoulder; and I found the way to the presence very intricate, leading through many passages, with sentinels placed at the different doors. When we came to the entrance of the court in which the king resides, both my guide and interpreter, according to custom, took off their sandals; and the former pronounced the king's name aloud, repeating it till he was answered from within. We found the monarch sitting upon a mat, and two attendants with him. I repeated what I had before told him concerning the object of my journey, and my reasons for passing through his country. He seemed, however, but half satisfied. The notion of travelling for curiosity was quite new to him. He thought it impossible, he said, that any man in his senses would undertake so dangerous a journey, merely to look at the country and its inhabitants. However, when I offered to show him the contents of my portmanteau, and every thing belonging to me, he was convinced; and it was evident that his suspicion had arisen from a belief that every white man must of necessity be a trader. When I had delivered my presents, he seemed well pleased, and was particularly delighted with the umbrella, which he repeatedly furled and unfurled, to the great admiration of himself and his two attendants, who could not for some time comprehend the use of this wonderful machine. After this I was about to take my leave, when the king, desiring me to stop a while, began a long preamble in favour of the whites, extolling their immense wealth and good dispositions. He next proceeded to an eulogium on my blue coat, of which the yellow buttons seemed particularly to catch his fancy; and he concluded by entreating me to present him with it—assuring me, for my consolation under the loss of it, that he would wear it on all public occasions, and inform every one who saw it of my great liberality towards him. The request of an African prince, in his own dominions, particularly when made to a stranger, comes little short of a command. It is only a way of obtaining by gentle means, what he can, if he pleases, take by force; and as it was against my interest to offend him by a refusal, I very quietly took off my coat, the only good one in my possession, and laid it at his feet.

In return for my compliance, he presented me with great plenty of provisions, and desired to see me again in the morning. I accordingly attended, and found him sitting upon his bed. He told me he was sick, and wished to have a little blood taken from him; but I had no sooner tied up his arm, and displayed the lancet, than his courage failed; and he begged me to postpone the operation till the afternoon, as he felt

himself, he said, much better than he had been, and thanked me kindly for my readiness to serve him. He then observed, that his women were very desirous to see me, and requested that I would favour them with a visit. An attendant was ordered to conduct me—and I had no sooner entered the court appropriated to the ladies, than the whole seraglio surrounded me—some begging for physic, some for amber; and all of them desirous of trying that great African specific, *blood-letting*. They were ten or twelve in number, most of them young and handsome, and wearing on their heads ornaments of gold, and beads of amber.

They rallied me with a good deal of gaiety on different subjects; particularly upon the whiteness of my skin, and the prominence of my nose. They insisted that both were artificial. The first, they said, was produced when I was an infant, by dipping me in milk; and they insisted that my nose had been pinched every day, till it had acquired its present unsightly and unnatural conformation. On my part, without disputing my own deformity, I paid them many compliments on African beauty. I praised the glossy jet of their skins, and the lovely depression of their noses; but they said that flattery, or (as they emphatically termed it) *honey-mouth*, was not esteemed in Bondou. In return, however, for my company or my compliments (to which, by the way, they seemed not so insensible as they affected to be), they presented me with a jar of honey and some fish, which were sent to my lodging; and I was desired to come again to the king a little before sunset.

I carried with me some beads and writing paper, it being usual to present some small offering on taking leave: in return for which, the king gave me five drachms of gold; observing, that it was but a trifle, and given out of pure friendship, but would be of use to me in travelling, for the purchase of provisions. He seconded this act of kindness by one still greater; politely telling me, that though it was customary to examine the baggage of every traveller passing through his country, yet, in the present instance, he would dispense with that ceremony; adding, I was at liberty to depart when I pleased.

Accordingly, on the morning of the 23d, we left Fatteconda, and about eleven o'clock came to a small village, where we determined to stop for the rest of the day.

In the afternoon my fellow-travellers informed me, that as this was the boundary between Bondou and Kajaaga, and dangerous for travellers, it would be necessary to continue our journey by night, until we should reach a more hospitable part of the country. I agreed to the proposal, and hired two people for guides through the woods; and as soon as the people of the village were gone to sleep (the moon shining bright), we set out. The stillness of the air, the howling of the wild beasts, and the deep solitude of the forest, made the scene solemn and impressive. Not a word was uttered by any of us but in a whisper; all were attentive, and every one anxious to show his sagacity by pointing out to me the wolves and hyenas, as they glided, like shadows, from one thicket to another. Towards morning, we arrived at a village called Kimmoo, where our guides awakened one of their acquaintances, and we stopped to give the asses some corn, and roast a few ground nuts for ourselves. At day-light we resumed our journey; and in the afternoon arrived at Joag, in the kingdom of Kajaaga.

Being now in a country, and among a people, differing in many respects from those that have as yet fallen under our observation, I shall, before I proceed farther, give some account of Bondou (the territory we have left), and its inhabitants the Foulahs, the description of whom I purposely reserved for this part of my work.

Bondou is bounded on the east by Bambouk, on the south-east and south by Tenda and the Simbani wilderness, on the south-west by Woolli, on the west by Foota Torra, and on the north by Kajaaga.

The country, like that of Woolli, is very generally covered with woods, but the land is more elevated, and,

towards the Falemé river, rises into considerable hills. In native fertility, the soil is not surpassed, I believe, by any part of Africa.

From the central situation of Bondou, between the Gambia and Senegal rivers, it is become a place of great resort, both for the slaves—who generally pass through it, in going from the coast to the interior countries—and for occasional traders, who frequently come hither from the inland countries to purchase salt.

These different branches of commerce are conducted principally by Mandingoes and Serawoolies who have settled in the country. These merchants likewise carry on a considerable trade with Gedumal, and other Moorish countries, bartering corn and blue cotton cloths for salt; which they again barter in Dentila, and other districts, for iron, shea-butter, and small quantities of gold-dust. They likewise sell a variety of sweet-smelling gums, packed up in small bags, containing each about a pound. These gums, being thrown on hot embers, produce a very pleasant odour, and are used by the Mandingoes for perfuming their huts and clothes.

The customs, or duties on travellers, are very heavy; in almost every town an ass-load pays a bar of European merchandise, and at Fatteconda, the residence of the king, one Indian baft, or a musket, and six bottles of gunpowder, are exacted as the common tribute. By means of these duties, the king of Bondou is well supplied with arms and ammunition—a circumstance which makes him formidable to the neighbouring states.

The inhabitants differ in their complexions and national manners from the Mandingoes and Serawoolies, with whom they are frequently at war. Some years ago the king of Bondou crossed the Falemé river with a numerous army; and, after a short and bloody campaign, totally defeated the forces of Sambou, king of Bambouk, who was obliged to sue for peace, and surrender to him all the towns along the eastern bank of the Falemé.

The Foulahs in general (as has been observed in a former chapter) are of a tawny complexion, with small features and soft silky hair; next to the Mandingoes, they are undoubtedly the most considerable of all the nations in this part of Africa. Their original country is said to be Fooladoo (which signifies the country of the Foulahs); but they possess at present many other kingdoms at a great distance from each other: their complexion, however, is not exactly the same in the different districts; in Bondou, and the other kingdoms which are situated in the vicinity of the Moorish territories, they are of a more yellow complexion than in the southern states.

The Foulahs of Bondou are naturally of a mild and gentle disposition, but the uncharitable maxims of the Koran have made them less hospitable to strangers, and more reserved in their behaviour, than the Mandingoes. They evidently consider all the negro natives as their inferiors; and, when talking of different nations, always rank themselves among the white people.

Their government differs from that of the Mandingoes chiefly in this, that they are more immediately under the influence of the Mahomedan laws; for all the chief men, the king excepted, and a large majority of the inhabitants of Bondou, are Mussulmen, and the authority and laws of the Prophet are every where looked upon as sacred and decisive. In the exercise of their faith, however, they are not very intolerant towards such of their countrymen as still retain their ancient superstitions. Religious persecution is not known among them, nor is it necessary; for the system of Mahomet is made to extend itself by means abundantly more efficacious. By establishing small schools in the different towns, where many of the pagan as well as Mahomedan children are taught to read the Koran, and instructed in the tenets of the Prophet, the Mahomedan priests fix a bias on the minds, and form the character, of their young disciples, which no accidents of life can ever afterwards remove or alter. Many of these little schools I visited in my progress through the country, and observed with pleasure the great docility and submissive deportment of the children, and heartily

wished they had had better instructors, and a purer religion.

With the Mahomedan faith is also introduced the Arabic language, with which most of the Foulahs have a slight acquaintance. Their native tongue abounds very much in liquids, but there is something unpleasant in the manner of pronouncing it. A stranger, on hearing the common conversation of two Foulahs, would imagine that they were scolding each other. Their numerals are these:—

|                |                   |
|----------------|-------------------|
| One, Go.       | Six, Jogo.        |
| Two, Deeddee.  | Seven, Jeedeedee. |
| Three, Tettee. | Eight, Je Tettee. |
| Four, Nee.     | Nine, Je Nee.     |
| Five, Jouee.   | Ten, Sappo.       |

The industry of the Foulahs, in the occupations of pasturage and agriculture, is every where remarkable. Even on the banks of the Gambia, the greater part of the corn is raised by them, and their herds and flocks are more numerous and in better condition than those of the Mandingoes; but in Bondou they are opulent in a high degree, and enjoy all the necessaries of life in the greatest profusion. They display great skill in the management of their cattle, making them extremely gentle by kindness and familiarity. On the approach of night, they are collected from the woods and secured in folds, called *korrees*, which are constructed in the neighbourhood of the different villages. In the middle of each korree is erected a small hut, wherein one or two of the herdsmen keep watch during the night, to prevent the cattle from being stolen, and to keep up the fires which are kindled round the korree to frighten away the wild beasts.

The cattle are milked in the mornings and evenings: the milk is excellent; but the quantity obtained from any one cow is by no means so great as in Europe. The Foulahs use the milk chiefly as an article of diet, and that not until it is quite sour. The cream which it affords is very thick, and is converted into butter by stirring it violently in a large calabash. This butter, when melted over a gentle fire, and freed from impurities, is preserved in small earthen pots, and forms a part in most of their dishes; it serves likewise to anoint their heads, and is bestowed very liberally on their faces and arms.

But although milk is plentiful, it is somewhat remarkable that the Foulahs, and indeed all the inhabitants of this part of Africa, are totally unacquainted with the art of making cheese. A firm attachment to the customs of their ancestors, makes them view with an eye of prejudice every thing that looks like innovation. The heat of the climate, and the great scarcity of salt, are held forth as unanswerable objections; and the whole process appears to them too long and troublesome to be attended with any solid advantage.

Besides the cattle, which constitute the chief wealth of the Foulahs, they possess some excellent horses, the breed of which seems to be a mixture of the Arabian with the original African.

## CHAPTER V.

Account of Kajaaga—Serawoolies—Their Manners and Language.—Account of Joag.—The Author is ill-treated, and robbed of half of his effects, by order of Batcheri, the King.—Charity of a Female Slave.—The Author is visited by Demba Sego, Nephew of the King of Kasson, who offers to conduct him in safety to that Kingdom.—Offer accepted.—The Author and his Protector, with a numerous Retinue, set out and reach Samee, on the Banks of the Senegal.—Proceed to Kayee, and, crossing the Senegal, arrive in the Kingdom of Kasson.

THE kingdom of Kajaaga, in which I was now arrived, is called by the French Gallam; but the name that I have adopted is universally used by the natives. This country is bounded on the south-east and south by Bambouk, on the west by Bondou and Poota-Torra, and on the north by the river Senegal.

The air and climate are, I believe, more pure and salubrious than at any of the settlements towards the coast; the face of the country is every where interspersed with a pleasing variety of hills and vallies; and the windings of the Senegal river, which descends from the rocky hills of the interior, make the scenery on its banks very picturesque and beautiful.

The inhabitants are called Serawoolies, or (as the French write it) *Seracolets*. Their complexion is a jet black: they are not to be distinguished in this respect from the Jaloffs.

The government is monarchical; and the regal authority, from what I experienced of it, seems to be sufficiently formidable. The people themselves, however, complain of no oppression, and seemed all very anxious to support the king in a contest he was going to enter into with the sovereign of Kasson. The Serawoolies are habitually a trading people; they formerly carried on a great commerce with the French in gold and slaves, and still maintain some traffic in slaves with the British factories on the Gambia. They are reckoned tolerably fair and just in their dealings, but are indefatigable in their exertions to acquire wealth, and they derive considerable profits by the sale of salt, and cotton cloth, in distant countries. When a Serawooli merchant returns home from a trading expedition, the neighbours immediately assemble to congratulate him upon his arrival. On these occasions the traveller displays his wealth and liberality, by making a few presents to his friends; but if he has been unsuccessful, his levee is soon over, and every one looks upon him as a man of no understanding, who could perform a long journey and (as they express it) "bring back nothing but the hair upon his head."

Their language abounds much in gutturals, and is not so harmonious as that spoken by the Foulahs: it is, however, well worth acquiring by those who travel through this part of the African continent—it being very generally understood in the kingdoms of Kasson, Kaarta, Ludamar, and the northern parts of Bambarra. In all these countries the Serawoolies are the chief traders. Their numerals are:—

|                |                        |
|----------------|------------------------|
| One, Bani.     | Seven, Nero.           |
| Two, Fillo.    | Eight, Sego.           |
| Three, Sicc.   | Nine, Kabbo.           |
| Four, Narrato. | Ten, Tamo.             |
| Five, Karrago. | Twenty, Tamo di Fillo. |
| Six, Toomo.    |                        |

We arrived at Joag, the frontier town of this kingdom, on the 24th of December, and took up our residence at the house of the chief man, who is here no longer known by the title of *alkaid*, but is called the *dooty*. He was a rigid Mahomedan, but distinguished for his hospitality. This town may be supposed, on a gross computation, to contain two thousand inhabitants. It is surrounded by a high wall, in which are a number of port-holes for musketry to fire through, in case of an attack. Every man's possession is likewise surrounded by a wall—the whole forming so many distinct citadels; and amongst a people unacquainted with the use of artillery, these walls answer all the purposes of stronger fortifications. To the westward of the town is a small river, on the banks of which the natives raise great plenty of tobacco and onions.

The same evening Madiboo the bushreen, who had accompanied me from Pisania, went to pay a visit to his father and mother, who dwelt at a neighbouring town, called Dramanet. He was joined by my other attendant the blacksmith; and as soon as it was dark, I was invited to see the sports of the inhabitants, it being their custom, on the arrival of strangers, to welcome them by diversions of different kinds. I found a great crowd surrounding a party who were dancing, by the light of some large fires, to the music of four drums, which were beat with great exactness and uniformity. The dances, however, consisted more in wanton gestures than in muscular exertion or graceful attitudes. The ladies vied with each other in displaying the most voluptuous movements imaginable.

December 25th.—About two o'clock in the morning

a number of horsemen came into the town, and, having awakened my landlord, talked to him for some time in the Serawoolli tongue; after which they dismounted, and came to the bentang, on which I had made my bed. One of them, thinking that I was asleep, attempted to steal the musket that lay by me on the mat; but, finding that he could not effect his purpose undiscovered, he desisted; and the strangers sat down by me till daylight.

I could now easily perceive, by the countenance of my interpreter, Johnson, that something very unpleasant was in agitation. I was likewise surprised to see Madiboo and the blacksmith so soon returned. On inquiring the reason, Madiboo informed me, that as they were dancing at Dramanet, ten horsemen belonging to Batcheri, king of the country, with his second son at their head, had arrived there, inquiring if the white man had passed; and on being told that I was at Joag, they rode off without stopping. Madiboo added, that on hearing this, he and the blacksmith hastened back to give me notice of their coming. Whilst I was listening to this narrative, the ten horsemen mentioned by Madiboo arrived; and, coming to the bentang, dismounted and seated themselves with those who had come before—the whole being about twenty in number, forming a circle round me, and each man holding his musket in his hand. I took this opportunity to observe to my landlord, that as I did not understand the Serawoolli tongue, I hoped, whatever the men had to say, they would speak in Mandingo. To this they agreed; and a short man, loaded with a remarkable number of saphies, opened the business in a very long harangue, informing me that I had entered the king's town without having first paid the duties, or giving any present to the king, and that, according to the laws of the country, my people, cattle, and baggage, were forfeited. He added, that they had received orders from the king to conduct me to Maana,\* the place of his residence; and if I refused to come with them, their orders were to bring me by force—upon his saying which, all of them rose up and asked me if I was ready. It would have been equally vain and imprudent in me to have resisted or irritated such a body of men; I therefore affected to comply with their commands, and begged them only to stop a little until I had given my horse a feed of corn, and settled matters with my landlord. The poor blacksmith, who was a native of Kasson, mistook this feigned compliance for a real intention, and, taking me away from the company, told me, that he had always behaved towards me as if I had been his father and master, and he hoped I would not entirely ruin him by going to Maana; adding, that as there was every reason to believe a war would soon take place between Kasson and Kajaaga, he should not only lose his little property, the savings of four years' industry, but should certainly be detained and sold as a slave, unless his friends had an opportunity of paying two slaves for his redemption. I saw this reasoning in its full force, and determined to do my utmost to preserve the blacksmith from so dreadful a fate. I therefore told the king's son that I was ready to go with him, upon condition that the blacksmith, who was an inhabitant of a distant kingdom, and entirely unconnected with me, should be allowed to stay at Joag till my return; to this they all objected, and insisted that as we had all acted contrary to the laws, we were all equally answerable for our conduct.

I now took my landlord aside, and giving him a small present of gunpowder, asked his advice in so critical a situation. He was decidedly of opinion that I ought not to go to the king: he was fully convinced, he said, that if the king should discover any thing valuable in my possession, he would not be over scrupulous about the means of obtaining it. This made me the more solicitous to conciliate matters with the king's people; and I began by observing, that what I had done did not proceed from any want of respect towards the king,

\* Maana is within a short distance of the ruins of Fort St Joseph, on the Senegal river, formerly a French factory.

nor from any wish to violate his laws, but wholly from my own inexperience and ignorance, being a stranger, totally unacquainted with the laws and customs of their country: I had indeed entered the king's frontier, without knowing that I was to pay the duties beforehand, but I was ready to pay them now; which I thought was all they could reasonably demand. I then tendered them, as a present to the king, the five drachms of gold which the king of Bondou had given me; this they accepted, but insisted on examining my baggage, which I opposed in vain. The bundles were opened; but the men were much disappointed in not finding in them so much gold and amber as they expected: they made up the deficiency, however, by taking whatever things they fancied; and after wrangling and debating with me till sunset, they departed, having first robbed me of half my goods. These proceedings dispirited my people, and our fortune was not strengthened by a very indifferent supper, after a long fast. Madiboo begged me to turn back; Johnson laughed at the thought of proceeding without money; and the blacksmith was afraid to be seen, or even to speak, lest any one should discover him to be a native of Kasson. In this disposition, we passed the night by the side of a dim fire, and our situation the next day was very perplexing: it was impossible to procure provisions without money, and I knew that if I produced any beads or amber, the king would immediately hear of it, and I should probably lose the few effects I had concealed. We therefore resolved to combat hunger for the day, and wait some favourable opportunity of purchasing or begging provisions.

Towards the evening, as I was sitting upon the bentang chewing straws, an old female slave, passing by with a basket upon her head, asked me if I had got my dinner. As I thought she only laughed at me, I gave her no answer; but my boy, who was sitting close by, answered for me, and told her that the king's people had robbed me of all my money. On hearing this, the good old woman, with a look of unaffected benevolence, immediately took the basket from her head, and showing me that it contained ground nuts, asked me if I could eat them; being answered in the affirmative, she presented me with a few handfuls, and walked away, before I had time to thank her for this seasonable supply. This trifling circumstance gave me peculiar satisfaction. I reflected with pleasure on the conduct of this poor untutored slave, who, without examining into my character or circumstances, listened implicitly to the dictates of her own heart. Experience had taught her that hunger was painful, and her own distresses made her commiserate those of others.

The old woman had scarcely left me, when I received information that a nephew of Demba Sego Jalla, the Mandingo king of Kasson, was coming to pay me a visit. He had been sent on an embassy to Batcheri, king of Kajaaga, to endeavour to settle the disputes which had arisen between his uncle and the latter; but, after debating the matter four days without success, he was now on his return—and hearing that a white man was at Joag, on his way to Kasson, curiosity brought him to see me. I represented to him my situation and distresses, when he frankly offered me his protection, and said he would be my guide to Kasson (provided I would set out the next morning), and be answerable for my safety. I readily and gratefully accepted his offer, and was ready, with my attendants, by daylight on the morning of the 27th of December.

My protector, whose name was Demba Sego, probably after his uncle, had a numerous retinue. Our company, at leaving Joag, consisted of thirty persons and six loaded asses; and we rode on cheerfully enough for some hours, without any remarkable occurrence, until we came to a species of tree, for which my interpreter, Johnson, had made frequent inquiry. On finding it, he desired us to stop; and, producing a white chicken, which he had purchased at Joag for the purpose, he tied it by the leg to one of the branches, and then told us we might now safely proceed, for that our journey would be prosperous. This circumstance is

mentioned merely to illustrate the disposition of the negroes, and to show the power of superstition over their minds; for although this man had resided seven years in England, it was evident that he still retained the prejudices and notions he had imbibed in his youth. He meant this ceremony, he told me, as an offering, or sacrifice, to the spirits of the woods, who were, he said, a powerful race of beings, of a white colour, with long flowing hair. I laughed at his folly, but could not condemn the piety of his motives.

At noon we had reached Gungadi, a large town, where we stopped about an hour, until some of the asses that had fallen behind came up. Here I observed a number of date trees, and a mosque built of clay, with six turrets, on the pinnacles of which were placed six ostrich eggs. A little before sunset we arrived at the town of Samee, on the banks of the Senegal, which is here a beautiful but shallow river, moving slowly over a bed of sand and gravel. The banks are high, and covered with verdure—the country is open and cultivated—and the rocky hills of Fellow and Bambouk add much to the beauty of the landscape.

December 28th.—We departed from Samee, and arrived in the afternoon at Kayee, a large village, part of which is situated on the north, and part on the south side of the river. A little above this place is a considerable cataract, where the river flows over a ledge of whinstone rock with great force: below this the river is remarkably black and deep; and here it was proposed to make our cattle swim over. After hallooing, and firing some muskets, the people on the Kasson side observed us, and brought over a canoe to carry our baggage. I did not, however, think it possible to get the cattle down the bank, which is here more than forty feet above the water; but the negroes seized the horses, and launched them, one at a time, down a sort of trench or gully, that was almost perpendicular, and seemed to have been worn smooth by this sort of use. After the terrified cattle had been plunged in this manner to the water's edge, every man got down as well as he could. The ferryman then taking hold of the most steady of the horses by a rope, led him into the water, and paddled the canoe a little from the brink; upon which a general attack commenced upon the other horses, who, finding themselves pelted and kicked on all sides, unanimously plunged into the river, and followed their companion. A few boys swam in after them; and, by laving water upon them when they attempted to return, urged them onwards; and we had the satisfaction, in about fifteen minutes, to see them all safe on the other side. It was a matter of greater difficulty to manage the asses; their natural stubbornness of disposition made them endure a great deal of pelting and shoving before they would venture into the water; and when they had reached the middle of the stream, four of them turned back, in spite of every exertion to get them forwards. Two hours were spent in getting the whole of them over; an hour more was employed in transporting the baggage; and it was near sunset before the canoe returned, when Demba Segó and myself embarked in this dangerous passage-boat, which the least motion was like to overset. The king's nephew thought this a proper time to have a peep into a tin box of mine, that stood in the fore part of the canoe; and in stretching out his hand for it, he unfortunately destroyed the equilibrium, and overset the canoe. Luckily we were not far advanced, and got back to the shore without much difficulty; from whence, after wringing the water from our clothes, we took a fresh departure, and were soon afterwards safely landed in Kasson.

CHAPTER VI.

Arrival at Teesee.—Interview with Tiggity Segó, the King's Brother.—The Author's Detention at Teesee.—Sets out for Koonlakary, the Capital of the Kingdom.—Arrival there.

We no sooner found ourselves safe in Kasson, than Demba Segó told me that we were now in his uncle's

dominions, and he hoped I would consider, being now out of danger, the obligation I owed to him, and make him a suitable return for the trouble he had taken on my account by a handsome present. This, as he knew how much had been pilfered from me at Joag, was rather an unexpected proposition, and I began to fear that I had not much improved my condition by crossing the water; but as it would have been folly to complain, I made no observation upon his conduct, and gave him seven bars of amber and some tobacco, with which he seemed to be content.

After a long day's journey, in the course of which I discovered a number of large loose nodules of white granite, we arrived at Teesee on the evening of December 29th, and were accommodated in Demba Segó's hut. The next morning he introduced me to his father, Tiggity Segó, brother to the king of Kasson, chief of Teesee. The old man viewed me with great earnestness, having never, he said, beheld but one white man before, whom by his description I immediately knew to be Major Houghton. I related to him, in answer to his inquiries, the motives that induced me to explore the country. But he seemed to doubt the truth of what I asserted, thinking, I believe, that I secretly meditated some project which I was afraid to avow. He told me, it would be necessary I should go to Kooniakary, the residence of the king, to pay my respects to that prince, but desired me to come to him again before I left Teesee.

In the afternoon one of his slaves eloped; and a general alarm being given, every person that had a horse rode into the woods, in the hopes of apprehending him, and Demba Segó begged the use of my horse for the same purpose. I readily consented; and in about an hour they all returned with the slave, who was severely flogged, and afterwards put in irons. On the day following (December 31st), Demba Segó was ordered to go with twenty horsemen to a town in Gedumah, to adjust some dispute with the Moors, a party of whom were supposed to have stolen three horses from Teesee. Demba Segó begged a second time the use of my horse, adding, that the sight of my bridle and saddle would give him consequence among the Moors. This request also I readily granted, and he promised to return at the end of three days. During his absence I amused myself with walking about the town, and conversing with the natives, who attended me every where with great kindness and curiosity, and supplied me with milk, eggs, and what other provisions I wanted, on very easy terms.

Teesee is a large unwall'd town, having no security against the attack of an enemy except a sort of citadel, in which Tiggity and his family constantly reside. This town, according to the report of the natives, was formerly inhabited only by a few Foulah shepherds, who lived in considerable affluence by means of the excellent meadows in the neighbourhood, in which they reared great herds of cattle. But their prosperity attracting the envy of some Mandingoes, the latter drove out the shepherds, and took possession of their lands.

The present inhabitants, though they possess both cattle and corn in abundance, are not over nice in articles of diet; rats, moles, squirrels, snakes, locusts, &c. are eaten without scruple by the highest and lowest. My people were one evening invited to a feast given by some of the townsmen, where, after making a hearty meal of what they thought fish and kouskous, one of them found a piece of hard skin in the dish, and brought it along with him, to show me what sort of fish they had been eating. On examining the skin, I found they had been feasting on a large snake. Another custom still more extraordinary, is, that no woman is allowed to eat an egg. This prohibition, whether arising from ancient superstition, or from the craftiness of some old bushreen who loved eggs himself, is rigidly adhered to, and nothing will more affront a woman of Teesee than to offer her an egg. The custom is the more singular, as the men eat eggs without scruple in the presence of their wives, and I never observed the same prohibition in any other of the Mandingo countries.

The third day after his son's departure, Tiggity Segó held a palaver on a very extraordinary occasion, which I attended; and the debates on both sides of the question displayed much ingenuity. The case was this:—A young man, a kafir, of considerable affluence, who had recently married a young and handsome wife, applied to a very devout bushreen, or Mussulman priest, of his acquaintance, to procure him saphies for his protection during the approaching war. The bushreen complied with the request; and in order, as he pretended, to render the saphies more efficacious, enjoined the young man to avoid any nuptial intercourse with his bride for the space of six weeks. Severe as the injunction was, the kafir strictly obeyed; and, without telling his wife the real cause, absented himself from her company. In the mean time it began to be whispered at Teesee that the bushreen, who always performed his evening devotions at the door of the kafir's hut, was more intimate with the young wife than he ought to be. At first, the good husband was unwilling to suspect the honour of his sanctified friend, and one whole month elapsed before any jealousy rose in his mind; but hearing the charge repeated, he at last interrogated his wife on the subject, who frankly confessed that the bushreen had seduced her. Hereupon the kafir put her into confinement, and called a palaver upon the bushreen's conduct. The fact was clearly proved against him; and he was sentenced to be sold into slavery, or to find two slaves for his redemption, according to the pleasure of the complainant. The injured husband, however, was unwilling to proceed against his friend to such extremity, and desired rather to have him publicly flogged before Tiggity Segó's gate. This was agreed to, and the sentence was immediately executed. The culprit was tied by the hands to a strong stake; and a long black rod being brought forth, the executioner, after flourishing it round his head for some time, applied it with such force and dexterity to the bushreen's back, as to make him roar until the woods resounded with his screams. The surrounding multitude, by their hooting and laughing, manifested how much they enjoyed the punishment of this old gallant; and it is worthy of remark, that the number of stripes was precisely the same as are enjoined by the Mosaic law, *forty, save one*.

As there appeared great probability that Teesee, from its being a frontier town, would be much exposed during the war to the predatory excursions of the Moors of Gedumah, Tiggity Segó had, before my arrival, sent round to the neighbouring villages, to beg or to purchase as much provisions as would afford subsistence to the inhabitants for one whole year, independently of the crop on the ground, which the Moors might destroy. This project was well received by the country people, and they fixed a day on which to bring all the provisions they could spare to Teesee; and as my horse was not yet returned, I went, in the afternoon of January 4th, 1796, to meet the escort with the provisions.

It was composed of about 400 men, marching in good order, with corn and ground nuts in large calabashes upon their heads. They were preceded by a strong guard of bowmen, and followed by eight musicians or singing men. As soon as they approached the town, the latter began a song, every verse of which was answered by the company, and succeeded by a few strokes on the large drums. In this manner they proceeded, amidst the acclamations of the populace, till they reached the house of Tiggity Segó, where the loads were deposited; and in the evening they all assembled under the bentang tree, and spent the night in dancing and merriment. Many of these strangers remained at Teesee for three days, during which time I was constantly attended by as many of them as could conveniently see me; one party giving way to another, as soon as curiosity was gratified.

On the 5th of January, an embassy of ten people belonging to Almami Abdulkader, king of Foota-Torra, a country to the west of Bondou, arrived at Teesee; and, desiring Tiggity Segó to call an assembly of the inhabitants, announced publicly their king's determination

to this effect:—"That unless all the people of Kasson would embrace the Mahomedan religion, and evince their conversion by saying eleven public prayers, he, the king of Foota-Torra, could not possibly stand neuter in the present contest, but would certainly join his arms to those of Kajaga." A message of this nature, from so powerful a prince, could not fail to create great alarm; and the inhabitants of Teesee, after a long consultation, agreed to conform to his good pleasure, humiliating as it was to them. Accordingly, one and all publicly offered up eleven prayers, which were considered a sufficient testimony of their having renounced paganism, and embraced the doctrines of the Prophet.

It was the 8th of January before Demba Segó returned with my horse; and being quite wearied out with the delay, I went immediately to inform his father that I should set out for Kooniakary early the next day. The old man made many frivolous objections; and at length gave me to understand, that I must not think of departing without first paying him the same duties he was entitled to receive from all travellers; besides which he expected, he said, some acknowledgment for his kindness towards me. Accordingly, on the morning of the 9th, my friend Demba, with a number of people, came to me, and said that they were sent by Tiggity Segó for my present, and wished to see what goods I had appropriated for that purpose. I knew that resistance was hopeless, and complaint unavailing; and being in some measure prepared, by the intimation I had received the night before, I quietly offered him seven bars of amber, and five of tobacco. After surveying these articles for some time very coolly, Demba laid them down, and told me, that this was not a present for a man of Tiggity Segó's consequence, who had it in his power to take whatever he pleased from me. He added, that if I did not consent to make him a larger offering, he would carry all my baggage to his father, and let him choose for himself. I had no time for reply; for Demba and his attendants immediately began to open my bundles, and spread the different articles upon the floor, where they underwent a more strict examination than they had done at Joag. Every thing that pleased them they took without scruple; and amongst other things, Demba seized the tin box which had so much attracted his attention in crossing the river. Upon collecting the scattered remains of my little fortune after these people had left me, I found that, as at Joag I had been plundered of half, so here, without even the shadow of accusation, I was deprived of half the remainder. The blacksmith himself, though a native of Kasson, had also been compelled to open his bundles, and take an oath that the different articles they contained were his own exclusive property. There was, however, no remedy—and having been under some obligation to Demba Segó for his attention towards me in the journey from Joag, I did not reproach him for his rapacity, but determined to quit Teesee, at all events, the next morning. In the meanwhile, in order to raise the drooping spirits of my attendants, I purchased a fat sheep, and had it dressed for our dinner.

Early in the morning of January 10th, therefore, I left Teesee, and about mid-day ascended a ridge, from whence we had a distant view of the hills round Kooniakary. In the evening we reached a small village, where we slept, and, departing from thence the next morning, crossed in a few hours a narrow but deep stream called Krieko, a branch of the Senegal. About two miles farther to the eastward, we passed a large town called Madina; and at two o'clock came in sight of Jumbo, the blacksmith's native town, from whence he had been absent more than four years. Soon after this, his brother, who had by some means been apprised of his coming, came out to meet him, accompanied by a singing man: he brought a horse for the blacksmith, that he might enter his native town in a dignified manner; and he desired each of us to put a good charge of powder into our guns. The singing man now led the way, followed by the two brothers; and we were presently joined by a number of people from the town, all of whom demonstrated great joy at seeing their old

acquaintance the blacksmith, by the most extravagant jumping and singing. On entering the town, the singing man began an extempore song in praise of the blacksmith, extolling his courage in having overcome so many difficulties; and concluding with a strict injunction to his friends to dress him plenty of victuals.

When we arrived at the blacksmith's place of residence, we dismounted, and fired our muskets. The meeting between him and his relations was very tender; for these rude children of nature, free from restraint, display their emotions in the strongest and most expressive manner. Amidst these transports, the blacksmith's aged mother was led forth, leaning upon a staff. Every one made way for her; and she stretched out her hand to bid her son welcome. Being totally blind, she stroked his hands, arms, and face, with great care, and seemed highly delighted that her latter days were blessed by his return, and that her ears once more heard the music of his voice. From this interview I was fully convinced, that whatever difference there is between the negro and European in the conformation of the nose and the colour of the skin, there is none in the genuine sympathies and characteristic feelings of our common nature.

During the tumult of these congratulations, I had seated myself apart by the side of one of the huts, being unwilling to interrupt the flow of filial and parental tenderness; and the attention of the company was so entirely taken up with the blacksmith, that I believe none of his friends had observed me. When all the people present had seated themselves, the blacksmith was desired by his father to give them some account of his adventures; and silence being commanded, he began—and, after repeatedly thanking God for the success that had attended him, related every material occurrence that had happened to him from his leaving Kasson to his arrival at the Gambia—his employment and success in those parts—and the dangers he had escaped in returning to his native country. In the latter part of his narration, he had frequently occasion to mention me; and after many strong expressions concerning my kindness to him, he pointed to the place where I sat, and exclaimed, *Afille ibi siring!* ("See him sitting there!") In a moment all eyes were turned upon me—I appeared like a being dropped from the clouds—every one was surprised that they had not observed me before; and a few women and children expressed great uneasiness at being so near a man of such an uncommon appearance. By degrees, however, their apprehensions subsided; and when the blacksmith assured them that I was perfectly inoffensive, and would hurt nobody, some of them ventured so far as to examine the texture of my clothes; but many of them were still very suspicious—and when by accident I happened to move myself, or look at the young children, their mothers would scamper off with them with the greatest precipitation. In a few hours, however, they all became reconciled to me.

With these worthy people I spent the remainder of that, and the whole of the ensuing day, in feasting and merriment—and the blacksmith declared he would not quit me during my stay at Kooniakary; for which place we set out early on the morning of the 14th of January, and arrived about the middle of the day at Soolo, a small village three miles to the south of it.

As this place was somewhat out of the direct road, it is necessary to observe, that I went thither to visit a slatee, or Gambia trader, of great note and reputation, named Salim Dauhari. He was well known to Dr Laidley, who had trusted him with effects to the value of five slaves, and had given me an order for the whole of the debt. We luckily found him at home, and he received me with great kindness and attention.

It is remarkable, however, that the king of Kasson was, by some means, immediately apprised of my motions; for I had been at Soolo but a few hours, before Sambo Sego, his second son, came thither with a party of horse, to inquire what had prevented me from proceeding to Kooniakary, and waiting immediately upon

the king, who, he said, was impatient to see me. Salim Dauhari made my apology, and promised to accompany me to Kooniakary the same evening. We accordingly departed from Soolo at sunset, and in about an hour entered Kooniakary. But as the king had gone to sleep, we deferred the interview till next morning, and slept at the hut of Sambo Sego.

My interview with the king, and the incidents which occurred to me in the kingdoms of Kasson and Kaarta, will be the subject of the ensuing chapter.

## CHAPTER VII.

The Author admitted to an Audience of the King of Kasson, whom he finds well disposed towards him.—Incidents during the Author's stay at Kooniakary.—Departs thence for Kemmo, the Capital of Kaarta.—Is received with great kindness by the King of Kaarta, who dissuades him from prosecuting his Journey, on Account of approaching Hostilities with the King of Bambarra.—The Author determines, notwithstanding, to proceed; and the usual Routes being obstructed, takes the Path to Ludamar, a Moorish Kingdom.—Is accommodated by the King with a Guide to Jarra, the Frontier Town of the Moorish Territories; and sets out for that Place, accompanied by three of the King's Sons, and two hundred Horsemen.

ABOUT eight o'clock in the morning of January 15th, 1796, we went to an audience of the king (Demba Sego Jalla); but the crowd of people to see me was so great, that I could scarcely get admittance. A passage being at length obtained, I made my bow to the monarch, whom we found sitting upon a mat, in a large hut. He appeared to be a man of about sixty years of age: his success in war, and the mildness of his behaviour in time of peace, had much endeared him to all his subjects. He surveyed me with great attention; and when Salim Dauhari explained to him the object of my journey, and my reasons for passing through his country, the good old king appeared not only perfectly satisfied, but promised me every assistance in his power. He informed me that he had seen Major Houghton, and presented him with a white horse; but that, after crossing the kingdom of Kaarta, he had lost his life among the Moors, in what manner he could not inform me. When this audience was ended, we returned to our lodging, and I made up a small present for the king out of the few effects that were left me; for I had not yet received any thing from Salim Dauhari. This present, though inconsiderable in itself, was well received by the king, who sent me in return a large white bullock. The sight of this animal quite delighted my attendants; not so much on account of its bulk, as from its being of a white colour, which is considered as a particular mark of favour. But although the king himself was well disposed towards me, and readily granted me permission to pass through his territories, I soon discovered that very great and unexpected obstacles were likely to impede my progress. Besides the war which was on the point of breaking out between Kasson and Kajaga, I was told that the next kingdom of Kaarta, through which my route lay, was involved in the issue; and was furthermore threatened with hostilities on the part of Bambarra. The king himself informed me of these circumstances, and advised me to stay in the neighbourhood of Kooniakary, till such time as he could procure proper information respecting Bambarra, which he expected to do in the course of four or five days, as he had already, he said, sent four messengers into Kaarta for that purpose. I readily submitted to this proposal, and went to Soolo, to stay there till the return of one of those messengers. This afforded me a favourable opportunity of receiving what money Salim Dauhari could spare me on Dr Laidley's account. I succeeded in receiving the value of three slaves, chiefly in gold dust; and being anxious to proceed as quickly as possible, I begged Dauhari to use his interest with the king to allow me a guide by the

way of Fooladoo, as I was informed that the war had already commenced between the kings of Bambarra and Kaarta. Daucari accordingly set out for Kooniakary on the morning of the 20th, and the same evening returned with the king's answer, which was to this purpose—that the king had, many years ago, made an agreement with Daisy, king of Kaarta, to send all merchants and travellers through his dominions; but that if I wished to take the route through Fooladoo, I had his permission so to do; though he could not, consistently with his agreement, lend me a guide. Having felt the want of regal protection in a former part of my journey, I was unwilling to hazard a repetition of the hardships I had then experienced, especially as the money I had received was probably the last supply that I should obtain; I therefore determined to wait for the return of the messengers from Kaarta.

In the interim, it began to be whispered abroad that I had received plenty of gold from Salim Daucari, and on the morning of the 23d Sambo Sege paid me a visit, with a party of horsemen. He insisted upon knowing the exact amount of the money I had obtained, declaring, that whatever the sum was, one-half of it must go to the king; besides which, he intimated that he expected a handsome present for himself, as being the king's son, and for his attendants, as being the king's relations. The reader will easily perceive, that if all these demands had been satisfied, I should not have been overburdened with money; but though it was very mortifying to me to comply with the demands of injustice, and so arbitrary an exaction, yet, thinking that it was highly dangerous to make a foolish resistance, and irritate the lion when within the reach of his paw, I prepared to submit; and if Salim Daucari had not interposed, all my endeavours to mitigate this oppressive claim would have been of no avail. Salim at last prevailed upon Sambo to accept sixteen bars of European merchandise, and some powder and ball, as a complete payment of every demand that could be made upon me in the kingdom of Kasson.

January 26th.—In the forenoon, I went to the top of a high hill to the southward of Soolo, where I had a most enchanting prospect of the country. The number of towns and villages, and the extensive cultivation around them, surpassed every thing I had yet seen in Africa. A gross calculation may be formed of the number of inhabitants in this delightful plain, by considering that the king of Kasson can raise four thousand fighting men by the sound of his war drum. In traversing the rocky eminences of this hill, which are almost destitute of vegetation, I observed a number of large holes in the crevices and fissures of the rocks, where the wolves and hyænas take refuge during the day. Some of these animals paid us a visit on the evening of the 27th; their approach was discovered by the dogs of the village; and on this occasion it is remarkable that the dogs did not bark, but howl in the most dismal manner. The inhabitants of the village no sooner heard them, than, knowing the cause, they armed themselves; and, providing bunches of dry grass, went in a body to the inclosure in the middle of the village where the cattle were kept. Here they lighted the bunches of grass, and, waving them to and fro, ran hooping and hallooing towards the hills. This manoeuvre had the desired effect of frightening the wolves away from the village; but, on examination, we found that they had killed five of the cattle, and torn and wounded many others.

February 1st.—The messengers arrived from Kaarta, and brought intelligence that the war had not yet commenced between Bambarra and Kaarta, and that I might probably pass through Kaarta before the Bambarra army invaded that country.

February 3d.—Early in the morning, two guides on horseback came from Kooniakary to conduct me to the frontiers of Kaarta. I accordingly took leave of Salim Daucari, and parted for the last time from my fellow-traveller the blacksmith, whose kind solicitude for my welfare had been so conspicuous, and about ten o'clock departed from Soolo. We travelled this day through a rocky and hilly country, along the banks of the river

Krieko; and at sunset came to the village of Soomo, where we slept.

February 4th.—We departed from Soomo, and continued our route along the banks of the Krieko, which are every where well cultivated, and swarm with inhabitants. At this time they were increased by the number of people that had flown thither from Kaarta, on account of the Bambarra war. In the afternoon we reached Kimo, a large village, the residence of Madi Konko, governor of the hilly country of Kasson, which is called Sorroma. From hence the guides appointed by the king of Kasson returned, to join in the expedition against Kajaaga; and I waited until the 6th, before I could prevail on Madi Konko to appoint me a guide to Kaarta.

February 7th.—Departing from Kimo, with Madi Konko's son as a guide, we continued our course along the banks of the Krieko until the afternoon, when we arrived at Kangee, a considerable town. The Krieko is here but a small rivulet; this beautiful stream takes its rise a little to the eastward of this town, and descends with a rapid and noisy current, until it reaches the bottom of the high hill called Tappa, where it becomes more placid, and winds gently through the lovely plains of Kooniakary; after which, having received an additional branch from the north, it is lost in the Senegal, somewhere near the falls of Felow.

February 8th.—This day we travelled over a rough stony country; and having passed Seimpo and a number of other villages, arrived in the afternoon at Lackarago, a small village which stands upon the ridge of hills that separates the kingdoms of Kasson and Kaarta. In the course of the day, we passed many hundreds of people flying from Kaarta with their families and effects.

February 9th.—Early in the morning, we departed from Lackarago, and a little to the eastward came to the brow of a hill, from whence we had an extensive view of the country. Towards the south-east were perceived some very distant hills, which our guide told us were the mountains of Fooladoo. We travelled with great difficulty down a stony and abrupt precipice, and continued our way in the bed of a dry river course, where the trees, meeting over head, made the place dark and cool. In a little time we reached the bottom of this romantic glen, and about ten o'clock emerged from between two rocky hills, and found ourselves on the level and sandy plains of Kaarta. At noon we arrived at a *korree*, or watering place, where, for a few strings of beads, I purchased as much milk and cornmeal as we could eat; indeed, provisions are here so cheap, and the shepherds live in such affluence, that they seldom ask any return for what refreshments a traveller receives from them. From this *korree*, we reached Feesurah at sunset, where we took up our lodging for the night.

February 10th.—We continued at Feesurah all this day, to have a few clothes washed, and learn more exactly the situation of affairs before we ventured towards the capital.

February 11th.—Our landlord, taking advantage of the unsettled state of the country, demanded so extravagant a sum for our lodging, that, suspecting he wished for an opportunity to quarrel with us, I refused to submit to his exorbitant demand; but my attendants were so much frightened at the reports of approaching war, that they refused to proceed any farther, unless I could settle matters with him, and induce him to accompany us to Kemmo, for our protection on the road. This I accomplished with some difficulty; and by a present of a blanket which I had brought with me to sleep in, and for which our landlord had conceived a very great liking, matters were at length amicably adjusted, and he mounted his horse and led the way. He was one of those negroes who, together with the ceremonial part of the Mahomedan religion, retain all their ancient superstitions, and even drink strong liquors. They are called Johars, or Jowars, and in this kingdom form a very numerous and powerful tribe. We had no sooner got into a dark and lonely part of the first wood, than he made a sign for us to stop, and, taking hold of a hollow piece of bamboo, that hung as an amulet round his neck,

whistled very loud three times. I confess I was somewhat startled, thinking it was a signal for some of his companions to come and attack us; but he assured me that it was done merely with a view to ascertain what success we were likely to meet with on our present journey. He then dismounted, laid his spear across the road, and having said a number of short prayers, concluded with three loud whistles; after which he listened for some time, as if in expectation of an answer, and receiving none, told us we might proceed without fear, for there was no danger. About noon we passed a number of large villages quite deserted, the inhabitants having fled into Kasson to avoid the horrors of war. We reached Karankalla at sunset: this formerly was a large town, but having been plundered by the Bambarans about four years ago, nearly one half of it is still in ruins.

February 12th.—At daylight we departed from Karankalla, and as it was but a short day's journey to Kemmo, we travelled slower than usual, and amused ourselves by collecting such eatable fruits as grew near the road-side. In this pursuit I had wandered a little from my people; and being uncertain whether they were before or behind me, I hastened to a rising ground to look about me. As I was proceeding towards this eminence, two negro horsemen, armed with muskets, came galloping from among the bushes: on seeing them I made a full stop; the horsemen did the same, and all three of us seemed equally surprised and confounded at this interview. As I approached them, their fears increased, and one of them, after casting upon me a look of horror, rode off at full speed; the other, in a panic of fear, put his hand over his eyes, and continued muttering prayers until his horse, seemingly without the rider's knowledge, conveyed him slowly after his companion. About a mile to the westward, they fell in with my attendants, to whom they related a frightful story: it seems their fears had dressed me in the flowing robes of a tremendous spirit, and one of them affirmed, that when I made my appearance, a cold blast of wind came pouring down upon him from the sky, like so much cold water. About noon we saw at a distance the capital of Kaarta, situated in the middle of an open plain—the country for two miles round being cleared of wood, by the great consumption of that article for building and fuel—and we entered the town about two o'clock in the afternoon.

We proceeded, without stopping, to the court before the king's residence; but I was so completely surrounded by the gazing multitude, that I did not attempt to dismount, but sent in the landlord and Madi Konko's son, to acquaint the king of my arrival. In a little time they returned, accompanied by a messenger from the king, signifying that he would see me in the evening; and in the meantime, the messenger had orders to procure me a lodging, and see that the crowd did not molest me. He conducted me into a court, at the door of which he stationed a man, with a stick in his hand to keep off the mob, and then showed me a large hut in which I was to lodge. I had scarcely seated myself in this spacious apartment, when the mob entered; it was found impossible to keep them out, and I was surrounded by as many as the hut could contain. When the first party, however, had seen me, and asked a few questions, they retired to make room for another company; and in this manner the hut was filled and emptied thirteen different times.

A little before sunset, the king sent to inform me that he was at leisure, and wished to see me. I followed the messenger through a number of courts surrounded with high walls, where I observed plenty of dry grass bundled up like hay, to fodder the horses, in case the town should be invested. On entering the court in which the king was sitting, I was astonished at the number of his attendants, and at the good order that seemed to prevail among them: they were all seated—the fighting men on the king's right hand, and the women and children on the left, leaving a space between them for my passage. The king, whose name was Daisy Koorabarri, was not to be distinguished from his sub-

jects by any superiority in point of dress; a bank of earth, about two feet high, upon which was spread a leopard's skin, constituted the only mark of royal dignity. When I had seated myself upon the ground before him, and related the various circumstances that had induced me to pass through his country, and my reasons for soliciting his protection, he appeared perfectly satisfied; but said it was not in his power at present to afford me much assistance, for that all sort of communication between Kaarta and Bambarra had been interrupted for some time past; and as Mansong, the king of Bambarra, with his army, had entered Fooladoo in his way to Kaarta, there was but little hope of my reaching Bambarra by any of the usual routes, inasmuch as, coming from an enemy's country, I should certainly be plundered, or taken for a spy. If his country had been at peace, he said, I might have remained with him until a more favourable opportunity offered; but, as matters stood at present, he did not wish me to continue in Kaarta, for fear some accident should befall me, in which case my countrymen might say that he had murdered a white man. He would therefore advise me to return into Kasson, and remain there until the war should terminate, which would probably happen in the course of three or four months, after which, if he was alive, he said, he would be glad to see me, and if he was dead, his sons would take care of me.

This advice was certainly well meant on the part of the king, and perhaps I was to blame in not following it; but I reflected that the hot months were approaching, and I dreaded the thoughts of spending the rainy season in the interior of Africa. These considerations, and the aversion I felt at the idea of returning without having made a greater progress in discovery, made me determine to go forwards; and though the king could not give me a guide to Bambarra, I begged that he would allow a man to accompany me as near the frontiers of his kingdom as was consistent with safety. Finding that I was determined to proceed, the king told me that one route still remained, but that, he said, was by no means free from danger—which was to go from Kaarta into the Moorish kingdom of Ludamar, from whence I might pass, by a circuitous route, into Bambarra. If I wished to follow this route, he would appoint people to conduct me to Jarra, the frontier town of Ludamar. He then inquired very particularly how I had been treated since I had left the Gambia, and asked, in a jocular way, how many slaves I expected to carry home with me on my return. He was about to proceed, when a man mounted on a fine Moorish horse, which was covered with sweat and foam, entered the court, and signifying that he had something of importance to communicate, the king immediately took up his sandals, which is the signal to strangers to retire. I accordingly took leave, but desired my boy to stay about the place, in order to learn something of the intelligence that this messenger had brought. In about an hour the boy returned, and informed me that the Bambarra army had left Fooladoo, and was on its march towards Kaarta; that the man I had seen, who had brought this intelligence, was one of the scouts, or watchmen, employed by the king, each of whom has his particular station (commonly on some rising ground), from whence he has the best view of the country, and watches the motions of the enemy.

In the evening the king sent me a fine sheep, which was very acceptable, as none of us had tasted victuals during the day. Whilst we were employed in dressing supper, evening prayers were announced—not by the call of the priest, as usual, but by beating on drums, and blowing through large elephants' teeth, hollowed out in such a manner as to resemble bugle horns. The sound is melodious, and, in my opinion, comes nearer to the human voice than any other artificial sound. As the main body of Daisy's army was, at this juncture, at Kemmo, the mosques were very much crowded; and I observed, that the disciples of Mahomet composed nearly one-half of the army of Kaarta.

February 13th.—At daylight I sent my horse-pistols

and holsters as a present to the king, and being very desirous to get away from a place which was likely soon to become the seat of war, I begged the messenger to inform the king that I wished to depart from Kenmoo as soon as he should find it convenient to appoint me a guide. In about an hour the king sent his messenger to thank me for the present, and eight horsemen to conduct me to Jarra. They told me that the king wished me to proceed to Jarra with all possible expedition, that they might return before any thing decisive should happen between the armies of Bambarra and Kaarta. We accordingly departed forthwith from Kemmo, accompanied by three of Daisy's sons, and about two hundred horsemen, who kindly undertook to see me a little way on my journey.

### CHAPTER VIII.

Journey from Kemmo to Funingkyed. — Some Account of the Lotus — A Youth Murdered by the Moors — Interesting Scene at his Death. — Author passes through Simbing. — Some Particulars concerning Major Houghton. — Author reaches Jarra — Situation of the surrounding States at the period of his Arrival there, and a brief Account of the War between Kaarta and Bambarra.

On the evening of the day of our departure from Kemmo (the king's eldest son and great part of the horsemen having returned), we reached a village called Marina, where we slept. During the night some thieves broke into the hut where I had deposited my baggage, and having cut open one of my bundles, stole a quantity of beads, part of my clothes, and some amber and gold, which happened to be in one of the pockets. I complained to my protectors, but without effect. The next day (February 14th) was far advanced before we departed from Marina, and we travelled slowly, on account of the excessive heat, until four o'clock in the afternoon, when two negroes were observed sitting among some thorny bushes, at a little distance from the road. The king's people, taking it for granted that they were runaway slaves, cocked their muskets, and rode at full speed in different directions through the bushes, in order to surround them, and prevent their escaping. The negroes, however, waited with great composure until we came within bowshot of them, when each of them took from his quiver a handful of arrows, and putting two between his teeth and one in his bow, waved to us with his hand to keep at a distance, upon which one of the king's people called out to the strangers to give some account of themselves. They said that "they were natives of Toorda, a neighbouring village, and had come to that place to gather *tomberongs*." These are small farinaceous berries, of a yellow colour and delicious taste, which I knew to be the fruit of the *rhamnus lotus* of Linnaeus. The negroes showed us two large baskets full, which they had collected in the course of the day. These berries are much esteemed by the natives, who convert them into a sort of bread, by exposing them for some days to the sun, and afterwards pounding them gently in a wooden mortar, until the farinaceous part of the berry is separated from the stone. This meal is then mixed with a little water, and formed into cakes, which, when dried in the sun, resemble in colour and flavour the sweetest gingerbread. The stones are afterwards put into a vessel of water, and shaken about so as to separate the meal which may still adhere to them: this communicates a sweet and agreeable taste to the water, and, with the addition of a little pounded millet, forms a pleasant gruel called *fondi*, which is the common breakfast in many parts of Ludamar, during the months of February and March. The fruit is collected by spreading a cloth upon the ground, and beating the branches with a stick.

The lotus is very common in all the kingdoms which I visited; but is found in the greatest plenty on the sandy soil of Kaarta, Ludamar, and the northern parts

of Bambarra, where it is one of the most common shrubs of the country. I had observed the same species at Gambia.

As this shrub is found in Tunis, and also in the negro kingdoms, and as it furnishes the natives of the latter with a food resembling bread, and also with a sweet liquor, which is much relished by them, there can be little doubt of its being the lotus mentioned by Pliny as the food of the Lybian Lotophagi. An army may very well have been fed with the bread I have tasted, made of the meal of the fruit, as is said by Pliny to have been done in Lybia; and as the taste of the bread is sweet and agreeable, it is not likely that the soldiers would complain of it.

We arrived in the evening at the village of Toorda; when all the rest of the king's people turned back except two, who remained with me as guides to Jarra.

February 15th. — I departed from Toorda, and about two o'clock came to a considerable town, called Funingkyed. As we approached the town, the inhabitants were much alarmed; for, as one of my guides wore a turban, they mistook us for some Moorish banditti. This misapprehension was soon cleared up, and we were well received by a Gambia sateer, who resides at this town, and at whose house we lodged.

February 16th. — We were informed that a number of people would go from this town to Jarra on the day following; and as the road was much infested by the Moors, we resolved to stay and accompany the travellers. In the meantime we were told, that a few days before our arrival, most of the bushreens and people of property in Funingkyed had gone to Jarra, to consult about removing their families and effects to that town, for fear of the approaching war; and that the Moors, in their absence, had stolen some of their cattle.

About two o'clock, as I was lying asleep upon a bullock's hide behind the door of the hut, I was awakened by the screams of women, and a general clamour and confusion among the inhabitants. At first I suspected that the Bambarrans had actually entered the town; but, observing my boy upon the top of one of the huts, I called to him to know what was the matter. He informed me that the Moors were come a second time to steal the cattle, and that they were now close to the town. I mounted the roof of the hut, and observed a large herd of bullocks coming towards the town, followed by five Moors on horseback, who drove the cattle forward with their muskets. When they had reached the wells, which are close to the town, the Moors selected from the herd sixteen of the finest beasts, and drove them off at full gallop. During this transaction, the townspeople, to the number of five hundred, stood collected close to the walls of the town; and when the Moors drove the cattle away, though they passed within pistol-shot of them, the inhabitants scarcely made a show of resistance. I only saw four muskets fired, which, being loaded with gunpowder of the negroes' own manufacture, did no execution. Shortly after this I observed a number of people supporting a young man upon horseback, and conducting him slowly towards the town. This was one of the herdsmen, who, attempting to throw his spear, had been wounded by a shot from one of the Moors. His mother walked on before, quite frantic with grief, clapping her hands, and enumerating the good qualities of her son. *Ee maffo fonio!* ("He never told a lie!") said the disconsolate mother, as her wounded son was carried in at the gate — *Ee maffo fonio abada!* ("He never told a lie; no, never!") When they had conveyed him to his hut, and laid him upon a mat, all the spectators joined in lamenting his fate, by screaming and howling in the most piteous manner.

After their grief had subsided a little, I was desired to examine the wound. I found that the ball had passed quite through his leg, having fractured both bones a little below the knee: the poor boy was faint from the loss of blood, and his situation withal so very precarious, that I could not console his relations with any great hopes of his recovery. However, to give him a possible chance, I observed to them that it was necessary to cut off his leg above the knee: this proposal made every

one start with horror; they had never heard of such a method of cure, and would by no means give their consent to it; indeed, they evidently considered me as a sort of cannibal for proposing so cruel and unheard-of an operation, which, in their opinion, would be attended with more pain and danger than the wound itself. The patient was therefore committed to the care of some old bushreens, who endeavoured to secure him a passage into paradise, by whispering in his ear some Arabic sentences, and desiring him to repeat them. After many unsuccessful attempts, the poor heathen at last pronounced, *La ilah el Allah, Mahomet rasool Allah;* ("There is but one God, and Mahomet is his Prophet?") and the disciples of the Prophet assured his mother that her son had given sufficient evidence of his faith, and would be happy in a future state. He died the same evening.

February 17th.—My guides informed me, that in order to avoid the Moorish banditti, it was necessary to travel in the night; we accordingly departed from Funingky in the afternoon, accompanied by about thirty people, carrying their effects with them into Ludamar, for fear of the war. We travelled with great silence and expedition until midnight, when we stopped in a sort of inclosure, near a small village; but the thermometer being so low as 68 degrees, none of the negroes could sleep on account of the cold.

At daybreak on the 18th, we resumed our journey, and at eight o'clock passed Simbing, the frontier village of Ludamar, situated in a narrow pass between two rocky hills, and surrounded with a high wall. From this village Major Houghton (being deserted by his negro servants, who refused to follow him into the Moorish country) wrote his last letter with a pencil to Dr Laidley. This brave but unfortunate man, having surmounted many difficulties, had taken a northerly direction, and endeavoured to pass through the kingdom of Ludamar, where I afterwards learned the following particulars concerning his melancholy fate:—On his arrival at Jarra, he got acquainted with certain Moorish merchants who were travelling to Tisheet (a place near the salt pits in the Great Desert, ten days' journey to the northward) to purchase salt; and the Major, at the expense of a musket and some tobacco, engaged them to convey him thither. It is impossible to form any other opinion on this determination, than that the Moors intentionally deceived him, either with regard to the route that he wished to pursue, or the state of the intermediate country between Jarra and Tombuc-too. Their intention probably was to rob and leave him in the desert. At the end of two days he suspected their treachery, and insisted on returning to Jarra. Finding him persist in this determination, the Moors robbed him of every thing he possessed, and went off with their camels; the poor Major being thus deserted, returned on foot to a watering-place in possession of the Moors, called Tarra. He had been some days without food, and the unfeeling Moors refusing to give him any, he sank at last under his distresses. Whether he actually perished of hunger, or was murdered outright by the savage Mahomedans, is not certainly known; his body was dragged into the woods—and I was shown at a distance the spot where his remains were left to perish.

About four miles to the north of Simbing, we came to a small stream of water, where we observed a number of wild horses: they were all of one colour, and galloped away from us at an easy rate, frequently stopping and looking back. The negroes hunt them for food, and their flesh is much esteemed.

About noon we arrived at Jarra, a large town situated at the bottom of some rocky hills. But before I proceed to describe the place itself, and relate the various occurrences which befel me there, it will not be improper to give my readers a brief recital of the origin of the war which induced me to take this route—an unfortunate determination, the immediate cause of all the misfortunes and calamities which afterwards befel me. The recital which I propose to give in this place, will prevent interruptions hereafter.

This war which desolated Kaarta, soon after I had left that kingdom, and spread terror into many of the neighbouring states, arose in the following manner:—A few bullocks belonging to a frontier village of Bambarra having been stolen by a party of Moors, were sold to the dooty, or chief man, of a town in Kaarta. The villagers claimed their cattle, and being refused satisfaction, complained of the dooty to their sovereign, Mansong, king of Bambarra, who probably beheld with an eye of jealousy the growing prosperity of Kaarta, and availed himself of this incident to declare hostilities against that kingdom.

With this view he sent a messenger and a party of horsemen to Daisy, king of Kaarta, to inform him that the king of Bambarra, with nine thousand men, would visit Kemmo in the course of the dry season, and to desire that he (Daisy) would direct his slaves to sweep the houses, and have every thing ready for their accommodation. The messenger concluded this insulting notification by presenting the king with a pair of *iron sandals*, at the same time adding, that "until such time as Daisy had worn out these sandals in his flight, he should never be secure from the arrows of Bambarra."

Daisy, having consulted with his chief men about the best means of repelling so formidable an enemy, returned an answer of defiance; and made a bushreen write in Arabic, upon a piece of thin board, a sort of proclamation, which was suspended to a tree in the public square, and a number of aged men were sent to different places to explain it to the common people. This proclamation called upon all the friends of Daisy to join him immediately, but to such as had no arms, or were afraid to enter into the war, permission was given to retire into any of the neighbouring kingdoms; and it was added, that provided they observed a strict neutrality, they should always be welcome to return to their former habitations: if, however, they took any active part against Kaarta, they had then "broken the key of their huts, and could never afterwards enter the door." Such was the expression.

This proclamation was very generally applauded; but many of the Kaartans, and amongst others the powerful tribes of Jower and Kakaroo, availing themselves of the indulgent clause, retired from Daisy's dominions, and took refuge in Ludamar and Kasson. By means of these desertions, Daisy's army was not so numerous as might have been expected; and when I was at Kemmo, the whole number of effective men, according to report, did not exceed four thousand; but they were men of spirit and enterprise, and could be depended on.

On the 22d of February (four days after my arrival at Jarra), Mansong, with his army, advanced towards Kemmo, and Daisy, without hazarding a battle, retired to Joko, a town to the north-west of Kemmo, where he remained three days, and then took refuge in a strong town called Gedingooma, situated in the hilly country, and surrounded with high walls of stone. When Daisy departed from Joko, his sons refused to follow him, alleging that "the singing men would publish their disgrace, as soon as it should be known that Daisy and his family had fled from Joko without firing a gun." They were therefore left behind, with a number of horsemen, to defend Joko; but, after many skirmishes, they were totally defeated, and one of Daisy's sons taken prisoner. The remainder fled to Gedingooma, which Daisy had stored with provisions, and where he determined to make his final stand.

Mansong, finding that Daisy was determined to avoid a pitched battle, placed a strong force at Joko to watch his motions, and, separating the remainder of his army into small detachments, ordered them to overrun the country, and seize upon the inhabitants before they had time to escape. These orders were executed with such promptitude, that in a few days the whole kingdom of Kaarta became a scene of desolation. Most of the poor inhabitants of the different towns and villages, being surprised in the night, fell an easy prey; and their corn, and every thing which could be useful to Daisy, was burnt and destroyed. During these trans-

actions, Daisy was employed in fortifying Gedingooma. This town is built in a narrow pass between two high hills, having only two gates, one towards Kaarta, and the other towards Jaffnoo; the gate towards Kaarta was defended by Daisy in person, and that towards Jaffnoo was committed to the charge of his sons. When the army of Bambarra approached the town, they made some attempts to storm it, but were always driven back with great loss; and Mansong, finding Daisy more formidable than he expected, resolved to cut off his supplies, and starve him into submission. He accordingly sent all the prisoners he had taken into Bambarra; and, having collected a considerable quantity of provisions, remained with his army two whole months in the vicinity of Gedingooma, without doing any thing decisive. During this time, he was much harassed by sallies from the besieged; and his stock of provisions being nearly exhausted, he sent to Ali, the Moorish king of Ludamar, for two hundred horsemen, to enable him to make an attack upon the north gate of the town, and give the Bambarrans an opportunity of storming the place. Ali, though he had made an agreement with Mansong, at the commencement of the war, to afford him assistance, now refused to fulfil his engagement, which so enraged Mansong, that he marched part of his army to Funingkedy, with a view to surprise the camp of Benowm; but the Moors having received intelligence of his design, fled to the northward; and Mansong, without attempting any thing farther, returned to Segó. This happened while I was myself in captivity in Ali's camp, as will hereafter be seen.

As the king of Kaarta had now got quit of his most formidable antagonist, it might have been hoped that peace would have been restored to his dominions; but an extraordinary incident involved him immediately afterwards in hostilities with Kasson, the king of which country dying about that time, the succession was disputed by his two sons. The younger (Sambo Segó, my old acquaintance) prevailed; and drove his brother from the country. He fled to Gedingooma; and being pursued thither, Daisy, who had lived in constant friendship with both the brothers, refused to deliver him up—at the same time declaring that he would not support his claim, nor any way interfere in the quarrel. Sambo Segó, elated with success, and proud of the homage that was paid him as sovereign of Kasson, was much displeas'd with Daisy's conduct, and joined with some disaffected fugitive Kaartans in a plundering expedition against him. Daisy, who little expected such a visit, had sent a number of people to Joko, to plant corn, and collect together such cattle as they might find straying in the woods, in order to supply his army. All these people fell into the hands of Sambo Segó, who carried them to Kooniakary, and afterwards sent them in caravans to be sold to the French at Fort Louis, on the river Senegal.

This attack was soon retaliated; for Daisy, who was now in distress for want of provisions, thought he was justified in supplying himself from the plunder of Kasson. He accordingly took with him eight hundred of his best men, and marching secretly through the woods, surprised in the night three large villages near Kooniakary, in which many of his traitorous subjects who were in Sambo's expedition had taken up their residence; all these, and indeed all the able men that fell into Daisy's hands, were immediately put to death.

After this expedition, Daisy began to indulge the hopes of peace—many of his discontented subjects had returned to their allegiance, and were repairing the towns which had been desolated by the war—the rainy season was approaching—and every thing wore a favourable appearance, when he was suddenly attacked from a different quarter.

The Jowers, Kakarocs, and some other Kaartans, who had deserted from him at the commencement of the war, and had shown a decided preference to Mansong and his army during the whole campaign, were now afraid or ashamed to ask forgiveness of Daisy, and being very powerful in themselves, joined together to make war upon him. They solicited the Moors to assist

them in their rebellion (as will appear hereafter), and having collected a considerable army, they plundered a large village belonging to Daisy, and carried off a number of prisoners.

Daisy immediately prepared to revenge this insult; but the Jowers, and indeed almost all the negro inhabitants of Ludamar, deserted their towns and fled to the eastward; and the rainy season put an end to the war of Kaarta, which had enriched a few individuals, but destroyed the happiness of thousands.

Such was the state of affairs among the nations in the neighbourhood of Jarra, soon after the period of my arrival there. I shall now proceed, after giving some description of that place, with the detail of events as they occurred.

## CHAPTER IX.

Some Account of Jarra, and the Moorish Inhabitants.—The Author applies for and obtains permission from Ali, the Moorish Chief or Sovereign of Ludamar, to pass through his Territories.—Departs from Jarra, and arrives at Deena—Is treated by the Moors.—Proceeds to Sampaka—Finds a Negro who makes Gunpowder.—Continues his Journey to Samee, where he is seized by some Moors, who are sent for that purpose by Ali—Is conveyed a Prisoner to the Moorish Camp at Benowm, on the Borders of the Great Desert.

THE town of Jarra is of considerable extent—the houses are built of clay and stone intermixed—the clay answering the purpose of mortar. It is situated in the Moorish kingdom of Ludamar; but the major part of the inhabitants are negroes, from the borders of the southern states, who prefer a precarious protection under the Moors, which they purchase by a tribute, rather than continue exposed to their predatory hostilities. The tribute they pay is considerable; and they manifest towards their Moorish superiors the most unlimited obedience and submission, and are treated by them with the utmost indignity and contempt. The Moors of this, and the other states adjoining the country of the negroes, resemble in their persons the Mulattoes of the West Indies, to so great a degree as not easily to be distinguished from them; and, in truth, the present generation seem to be a mixed race between the Moors (properly so called) of the north, and the negroes of the south, possessing many of the worst qualities of both nations.

Of the origin of these Moorish tribes, as distinguished from the inhabitants of Barbary, from whom they are divided by the Great Desert, nothing farther seems to be known than what is related by John Leo, the African, whose account may be abridged as follows:—

Before the Arabian conquest, about the middle of the seventh century, all the inhabitants of Africa, whether they were descended from Numidians, Phœnicians, Carthaginians, Romans, Vandals, or Goths, were comprehended under the general name of *Mauri*, or Moors. All these nations were converted to the religion of Mahomet, during the Arabian empire under the Kaliphs. About this time many of the Numidian tribes, who led a wandering life in the desert, and supported themselves upon the produce of their cattle, retired southward across the Great Desert to avoid the fury of the Arabians; and by one of those tribes, says Leo (that of *Zanhaga*), were discovered, and conquered, the negro nations on the Niger. By the Niger is here undoubtedly meant the river of Senegal, which in the Mandingo language is called *Bafing*, or the Black River.

To what extent these people are now spread over the African continent, it is difficult to ascertain. There is reason to believe, that their dominion stretches from west to east, in a narrow line or belt, from the mouth of the Senegal (on the northern side of that river) to the confines of Abyssinia. They are a subtle and treacherous race of people, and take every opportunity of cheating and plundering the credulous and unsus-

pecting negroes. But their manners and general habits of life will be best explained, as incidents occur in the course of my narrative.

On my arrival at Jarra, I obtained a lodging at the house of Daman Jumma, a Gambia slatee. This man had formerly borrowed goods from Dr Laidley, who had given me an order for the money, to the amount of six slaves; and though the debt was of five years' standing, he readily acknowledged it, and promised me what money he could raise. He was afraid, he said, in his present situation, he could not pay more than two slaves' value. He gave me his assistance, however, in exchanging my beads and amber for gold, which was a more portable article, and more easily concealed from the Moors.

The difficulties we had already encountered—the unsettled state of the country—and, above all, the savage and overbearing deportment of the Moors—had so completely frightened my attendants, that they declared they would rather relinquish every claim to reward, than proceed one step farther to the eastward. Indeed, the danger they incurred of being seized by the Moors, and sold into slavery, became every day more apparent; and I could not condemn their apprehensions. In this situation, deserted by my attendants, and reflecting that my retreat was cut off by the war behind me, and that a Moorish country of ten days' journey lay before me, I applied to Daman to obtain permission from Ali, the chief or sovereign of Ludamar, that I might pass through his country unmolested into Bambarra; and I hired one of Daman's slaves to accompany me thither, as soon as such permission should be obtained. A messenger was dispatched to Ali, who at this time was encamped near Benowm; and as a present was necessary in order to insure success, I sent him five garments of cotton cloth, which I purchased of Daman for one of my fowling-pieces. Fourteen days elapsed in settling this affair; but on the evening of the 26th of February, one of Ali's slaves arrived with directions, as he pretended, to conduct me in safety as far as Goomba, and told me I was to pay him one garment of blue cotton cloth for his attendance. My faithful boy, observing that I was about to proceed without him, resolved to accompany me; and told me, that though he wished me to turn back, he never entertained any serious thoughts of deserting me, but had been advised to it by Johnson, with a view to induce me to return immediately for Gambia.

February 27th.—I delivered most of my papers to Johnson, to convey them to Gambia as soon as possible, reserving a duplicate for myself in case of accidents. I likewise left in Daman's possession a bundle of clothes, and other things that were not absolutely necessary; for I wished to diminish my baggage as much as possible, that the Moors might have fewer inducements to plunder us.

Things being thus adjusted, we departed from Jarra in the forenoon, and slept at Troomgoomba, a small walled village, inhabited by a mixture of negroes and Moors. On the day following (February 28th) we reached Quira; and on the 29th, after a toilsome journey over a sandy country, we came to Compe, a watering place belonging to the Moors; from whence, on the morning following, we proceeded to Deena, a large town, and, like Jarra, built of stone and clay. The Moors are here in greater proportion to the negroes than at Jarra. They assembled round the hut of the negro where I lodged, and treated me with the greatest insolence: they hissed, shouted, and abused me; they even spit in my face, with a view to irritate me, and afford them a pretext for seizing my baggage. But, finding such insults had not the desired effect, they had recourse to the final and decisive argument, that I was a Christian, and of course that my property was lawful plunder to the followers of Mahomet. They accordingly opened my bundles, and robbed me of every thing they fancied. My attendants, finding that every body could rob me with impunity, insisted on returning to Jarra.

The day following (March 2d) I endeavoured, by all the means in my power, to prevail upon my people to

go on, but they still continued obstinate; and having reason to fear some farther insult from the fanatic Moors, I resolved to proceed alone. Accordingly, the next morning, about two o'clock, I departed from Deena. It was moonlight; but the roaring of the wild beasts made it necessary to proceed with caution.

When I had reached a piece of rising ground about half a mile from the town, I heard somebody halloo, and, looking back, saw my faithful boy running after me. He informed me that Ali's man had gone back to Benowm, and that Daman's negro was about to depart for Jarra; but he said he had no doubt, if I would stop a little, that he could persuade the latter to accompany us. I waited accordingly, and in about an hour the boy returned with the negro; and we continued travelling over a sandy country, covered chiefly with the *asclepias gigantea*, until mid-day, when we came to a number of deserted huts; and seeing some appearances of water at a little distance, I sent the boy to fill a soofroo; but as he was examining the place for water, the roaring of a lion, that was probably on the same pursuit, induced the frightened boy to return in haste, and we submitted patiently to the disappointment. In the afternoon we reached a town inhabited chiefly by Foulahs, called Samaming-kooos.

Next morning (March 4th) we set out for Sampaka; which place we reached about two o'clock. On the road we observed immense quantities of locusts: the trees were quite black with them. These insects devour every vegetable that comes in their way, and in a short time completely strip a tree of its leaves. The noise of their excrement falling upon the leaves and withered grass, very much resembles a shower of rain. When a tree is shaken or struck, it is astonishing to see what a cloud of them will fly off. In their flight they yield to the current of the wind, which, at this season of the year, is always from the north-east. Should the wind shift, it is difficult to conceive where they could collect food, as the whole of their course was marked with desolation.

Sampaka is a large town, and when the Moors and Bambarans were at war, was thrice attacked by the former; but they were driven off with great loss, though the king of Bambarra was afterwards obliged to give up this, and all the other towns as far as Goomba, in order to obtain a peace. Here I lodged at the house of a negro who practised the art of making gunpowder. He showed me a bag of nitre, very white, but the crystals were much smaller than common. They procure it in considerable quantities from the ponds, which are filled in the rainy season, and to which the cattle resort for coolness during the heat of the day. When the water is evaporated, a white efflorescence is observed on the mud, which the natives collect and purify in such a manner as to answer their purpose. The Moors supply them with sulphur from the Mediterranean; and the process is completed by pounding the different articles together in a wooden mortar. The grains are very unequal, and the sound of its explosion is by no means so sharp as that produced by European gunpowder.

March 5th.—We departed from Sampaka at daylight. About noon we stopped a little at a village called Dangali; and in the evening arrived at Dalli. We saw upon the road two large herds of camels feeding. When the Moors turn their camels to feed, they tie up one of their fore legs to prevent their straying. This happened to be a feast-day at Dalli, and the people were dancing before the dooty's house. But when they were informed that a white man was come into the town, they left off dancing, and came to the place where I lodged, walking in regular order, two and two, with the music before them. They play upon a sort of flute; but instead of blowing into a hole in the side, they blow obliquely over the end, which is half shut by a thin piece of wood; they govern the holes on the side with their fingers, and play some simple and very plaintive airs. They continued to dance and sing until midnight: during which time I was surrounded by so great a crowd, as made it necessary for me to satisfy their curiosity by sitting still.

March 6th.—We stopt here this morning, because some of the townspeople, who were going for Goomba on the day following, wished to accompany us; but in order to avoid the crowd of people which usually assembled in the evening, we went to a negro village to the east of Dalli, called Samee, where we were kindly received by the hospitable dooty, who on this occasion killed two fine sheep, and invited his friends to come and feast with him.

March 7th.—Our landlord was so proud of the honour of entertaining a white man, that he insisted on my staying with him and his friends until the cool of the evening, when he said he would conduct me to the next village. As I was now within two days' journey of Goomba, I had no apprehensions from the Moors, and readily accepted the invitation. I spent the forenoon very pleasantly with these poor negroes: their company was the more acceptable, as the gentleness of their manners presented a striking contrast to the rudeness and barbarity of the Moors. They enlivened their conversation by drinking a fermented liquor made from corn—the same sort of beer that I have described in a former chapter; and better I never tasted in Great Britain.

In the midst of this harmless festivity, I flattered myself that all danger from the Moors was over. Fancy had already placed me on the banks of the Niger, and presented to my imagination a thousand delightful scenes in my future progress, when a party of Moors unexpectedly entered the hut, and dispelled the golden dream. They came, they said, by Ali's orders, to convey me to his camp at Benowm. If I went peaceably, they told me, I had nothing to fear; but if I refused, they had orders to bring me by force. I was struck dumb by surprise and terror, which the Moors observing, endeavoured to calm my apprehensions, by repeating the assurance that I had nothing to fear. Their visit, they added, was occasioned by the curiosity of Ali's wife Fatima, who had heard so much about Christians, that she was very anxious to see one: as soon as her curiosity should be satisfied, they had no doubt, they said, that Ali would give me a handsome present, and send a person to conduct me to Bambarra. Finding entreaty and resistance equally fruitless, I prepared to follow the messengers, and took leave of my landlord and his company with great reluctance. Accompanied by my faithful boy—for Daman's slave made his escape on seeing the Moors—we reached Dalli in the evening; where we were strictly watched by the Moors during the night.

March 8th.—We were conducted by a circuitous path through the woods to Dangali, where we slept.

March 9th.—We continued our journey, and in the afternoon arrived at Sampaka. On the road we saw a party of Moors well armed, who told us that they were hunting for a runaway slave; but the townspeople informed us, that a party of Moors had attempted to steal some cattle from the town in the morning, but were repulsed—and, on their describing the persons, we were satisfied that they were the same banditti that we had seen in the woods.

Next morning (March 10th) we set out for Samaming-kooos. On the road we overtook a woman and two boys, with an ass; she informed us that she was going for Bambarra, but had been stopped on the road by a party of Moors, who had taken most of her clothes, and some gold from her; and that she would be under the necessity of returning to Deena till the fast moon was over. The same evening the new moon was seen, which ushered in the month Rhamadan. Large fires were made in different parts of the town, and a greater quantity of victuals than usual dressed upon the occasion.

March 11th.—By daylight the Moors were in readiness; but as I had suffered much from thirst on the road, I made my boy fill a soofroo of water for my own use, for the Moors assured me that they should not taste either meat or drink until sunset. However, I found that the excessive heat of the sun, and the dust we raised in travelling, overcame their scruples, and made my soofroo a very useful part of our baggage. On our

arrival at Deena, I went to pay my respects to one of Ali's sons. I found him sitting in a low hut, with five or six more of his companions, washing their hands and feet, and frequently taking water into their mouths, gargling, and spitting it out again. I was no sooner seated, than he handed me a double-barrelled gun, and told me to dye the stock of a blue colour, and repair one of the locks. I found great difficulty in persuading him that I knew nothing about the matter. However, says he, if you cannot repair the gun, you shall give me some knives and scissors immediately; and when my boy, who acted as interpreter, assured him that I had no such articles, he hastily snatched up a musket that stood by him, cocked it, and putting the muzzle close to the boy's ear, would certainly have shot him dead upon the spot, had not the Moors wrested the musket from him, and made signs for us to retreat. The boy, being terrified at this treatment, attempted to make his escape in the night, but was prevented by the vigilance of the Moors, who guarded us with strict attention—and at night always went to sleep by the door of the hut, in such a situation that it was almost impossible to pass without stepping upon them.

March 12th.—We departed from Deena towards Benowm, and about nine o'clock came to a korree, whence the Moors were preparing to depart to the southward, on account of the scarcity of water; here we filled our soofroo, and continued our journey over a hot sandy country, covered with small stunted shrubs, until about one o'clock, when the heat of the sun obliged us to stop. But our water being expended, we could not prudently remain longer than a few minutes to collect a little gum, which is an excellent succedaneum for water, as it keeps the mouth moist, and allays, for a time, the pain in the throat.

About five o'clock we came in sight of Benowm, the residence of Ali. It presented to the eye a great number of dirty-looking tents, scattered without order over a large space of ground; and among the tents appeared large herds of camels, cattle, and goats. We reached the skirts of this camp a little before sunset, and, with much entreaty, procured a little water. My arrival was no sooner observed, than the people who drew water at the wells threw down their buckets; those in the tents mounted their horses; and men, women, and children, came running or galloping towards me. I soon found myself surrounded by such a crowd that I could scarcely move; one pulled my clothes, another took off my hat, a third stopped me to examine my waistcoat buttons, and a fourth called out, *La illa el allah Mahamet rasoul allahi*—"There is but one God, and Mahomet is his prophet"—and signified, in a threatening manner, that I must repeat those words.

We reached at length the king's tent, where we found a great number of people, men and women, assembled. Ali was sitting upon a black leather cushion, clipping a few hairs from his upper lip; a female attendant holding up a looking-glass before him. He appeared to be an old man, of the Arab cast, with a long white beard; and he had a sullen and indignant aspect. He surveyed me with attention, and inquired of the Moors if I could speak Arabic: being answered in the negative, he appeared much surprised, and continued silent. The surrounding attendants, and especially the ladies, were abundantly more inquisitive: they asked a thousand questions; inspected every part of my apparel, searched my pockets, and obliged me to unbutton my waistcoat, and display the whiteness of my skin: they even counted my toes and fingers, as if they doubted whether I was in truth a human being. In a little time the priest announced evening prayers; but before the people departed, the Moor who had acted as interpreter, informed me that Ali was about to present me with something to eat; and looking round, I observed some boys bringing a wild hog, which they tied to one of the tent strings, and Ali made signs to me to kill and dress it for supper. Though I was very hungry, I did not think it prudent to eat any part of an animal so much detested by the Moors, and therefore told him that I never ate such food. They then untied the hog, in

hopes that it would run immediately at me—for they believe that a great enmity subsists between hogs and Christians—but in this they were disappointed; for the animal no sooner regained his liberty, than he began to attack indiscriminately every person that came in his way, and at last took shelter under the couch upon which the king was sitting. The assembly being thus dissolved, I was conducted to the tent of Ali's chief slave, but was not permitted to enter, nor allowed to touch any thing belonging to it. I requested something to eat, and a little boiled corn, with salt and water, was at length sent me in a wooden bowl; and a mat was spread upon the sand before the tent, on which I passed the night, surrounded by the curious multitude.

At sunrise, Ali, with a few attendants, came on horseback to visit me, and signified that he had provided a hut for me, where I would be sheltered from the sun. I was accordingly conducted thither, and found the hut comparatively cool and pleasant. It was constructed of corn stalks set up on end, in the form of a square, with a flat roof of the same materials, supported by forked sticks; to one of which was tied the wild hog before mentioned. This animal had certainly been placed there by Ali's order, out of derision to a Christian; and I found it a very disagreeable inmate, as it drew together a number of boys, who amused themselves by beating it with sticks, until they had so irritated the hog that it ran and bit at every person within its reach.

I was no sooner seated in this my new habitation, than the Moors assembled in crowds to behold me; but I found it rather a troublesome levee, for I was obliged to take off one of my stockings, and show them my foot, and even to take off my jacket and waistcoat, to show them how my clothes were put on and off: they were much delighted with the curious contrivance of buttons. All this was to be repeated to every succeeding visitor; for such as had already seen these wonders, insisted on their friends seeing the same; and in this manner I was employed, dressing and undressing, buttoning and unbuttoning, from noon till night. About eight o'clock, Ali sent me for supper some kouskous and salt and water, which was very acceptable, being the only victuals I had tasted since morning.

I observed that in the night the Moors kept regular watch, and frequently looked into the hut, to see if I was asleep; and if it was quite dark, they would light a wisp of grass. About two o'clock in the morning, a Moor entered the hut, probably with a view to steal something, or perhaps to murder me; and groping about, he laid his hand upon my shoulder. As night visitors were at best but suspicious characters, I sprang up the moment he laid his hand upon me; and the Moor, in his haste to get off, stumbled over my boy, and fell with his face upon the wild hog, which returned the attack by biting the Moor's arm. The screams of this man alarmed the people in the king's tent, who immediately conjectured that I had made my escape, and a number of them mounted their horses, and prepared to pursue me. I observed upon this occasion that Ali did not sleep in his own tent, but came galloping upon a white horse from a small tent at a considerable distance: indeed, the tyrannical and cruel behaviour of this man made him so jealous of every person around him, that even his own slaves and domestics knew not where he slept. When the Moors had explained to him the cause of this outcry, they all went away, and I was permitted to sleep quietly until morning.

March 13th.—With the returning day commenced the same round of insult and irritation—the boys assembled to beat the hog, and the men and women to plague the Christian. It is impossible for me to describe the behaviour of a people who study mischief as a science, and exult in the miseries and misfortunes of their fellow-creatures. It is sufficient to observe, that the rudeness, ferocity, and fanaticism, which distinguish the Moors from the rest of mankind, found here a proper subject whereon to exercise their propensities. I was a *stranger*, I was *unprotected*, and I was a *Christian*. Each of these circumstances is sufficient to drive every spark of humanity from the heart of a Moor;

but when all of them, as in my case, were combined in the same person, and a suspicion prevailed withal that I had come as a *spy* into the country, the reader will easily imagine that in such a situation I had every thing to fear. Anxious, however, to conciliate favour, and, if possible, to afford the Moors no pretence for ill treating me, I readily complied with every command, and patiently bore every insult; but never did any period of my life pass away so heavily—from sunrise till sunset was I obliged to suffer, with an unruined countenance, the insults of the rudest savages on earth.

## CHAPTER X.

Various Occurrences during the Author's Confinement at Benowm—Is visited by some Moorish Ladies.—A Funeral and Wedding.—The Author receives an extraordinary Present from the Bride.—Other Circumstances illustrative of the Moorish Character and Manners.

THE Moors, though very indolent themselves, are rigid task-masters, and keep every person under them in full employment. My boy Demba was sent to the woods to collect withered grass for Ali's horses; and after a variety of projects concerning myself, they at last found out an employment for me: this was no other than the respectable office of *barber*. I was to make my first exhibition in this capacity in the royal presence, and to be honoured with the task of shaving the head of the young prince of Ludamar. I accordingly seated myself upon the sand, and the boy, with some hesitation, sat down beside me. A small razor, about three inches long, was put into my hand, and I was ordered to proceed; but whether from my own want of skill, or the improper shape of the instrument, I unfortunately made a slight incision in the boy's head at the very commencement of the operation; and the king, observing the awkward manner in which I held the razor, concluded that his son's head was in very improper hands, and ordered me to resign the razor and walk out of the tent. This I considered as a very fortunate circumstance; for I had laid it down as a rule to make myself as useless and insignificant as possible, as the only means of recovering my liberty.

March 18th.—Four Moors arrived from Jarra with Johnson my interpreter, having seized him before he had received any intimation of my confinement, and bringing with them a bundle of clothes that I had left at Daman Jumia's house, for my use in case I should return by the way of Jarra. Johnson was led into Ali's tent and examined; the bundle was opened, and I was sent for to explain the use of the different articles. I was happy, however, to find that Johnson had committed my papers to the charge of one of Daman's wives. When I had satisfied Ali's curiosity respecting the different articles of apparel, the bundle was again tied up, and put into a large cow-skin bag that stood in a corner of the tent. The same evening Ali sent three of his people to inform me that there were many thieves in the neighbourhood, and that to prevent the rest of my things from being stolen, it was necessary to convey them all into his tent. My clothes, instruments, and every thing that belonged to me, were accordingly carried away; and though the heat and dust made clean linen very necessary and refreshing, I could not procure a single shirt out of the small stock I had brought along with me. Ali was however disappointed, by not finding among my effects the quantity of gold and amber that he expected; but to make sure of every thing, he sent the same people, on the morning following, to examine whether I had any thing concealed about my person. They, with their usual rudeness, searched every part of my apparel, and stripped me of all my gold, amber, my watch, and one of my pocket compasses; I had fortunately, in the night, buried the other compass in the sand—and this, with the clothes I had on, was all that the tyranny of Ali had now left me.

The gold and amber were highly gratifying to Moorish avarice, but the pocket compass soon became an object

of superstitious curiosity. Ali was very desirous to be informed why that small piece of iron, the needle, always pointed to the Great Desert; and I found myself somewhat puzzled to answer the question. To have pleaded my ignorance, would have created a suspicion that I wished to conceal the real truth from him; I therefore told him that my mother resided far beyond the sands of Sahara, and that whilst she was alive the piece of iron would always point that way, and serve as a guide to conduct me to her, and that if she was dead it would point to her grave. Ali now looked at the compass with redoubled amazement; turned it round and round repeatedly; but observing that it always pointed the same way, he took it up with great caution and returned it to me, manifesting that he thought there was something of magic in it, and that he was afraid of keeping so dangerous an instrument in his possession.

March 20th.—This morning a council of chief men was held in Ali's tent respecting me: their decisions, though they were all unfavourable to me, were differently related by different persons. Some said that they intended to put me to death; others that I was only to lose my right hand: but the most probable account was that which I received from Ali's own son, a boy about nine years of age, who came to me in the evening, and, with much concern, informed me that his uncle had persuaded his father to put out my eyes, which they said resembled those of a cat, and that all the bush-reens had approved of this measure. His father, however, he said, would not put the sentence into execution until Fatima the queen, who was at present in the north, had seen me.

March 21st.—Anxious to know my destiny, I went to the king early in the morning; and as a number of bush-reens were assembled, I thought this a favourable opportunity of discovering their intentions. I therefore began by begging his permission to return to Jarra, which was flatly refused: his wife, he said, had not yet seen me, and I must stay until she came to Benoum, after which I should be at liberty to depart; and that my horse, which had been taken away from me the day after I arrived, should be again restored to me. Unsatisfactory as this answer was, I was forced to appear pleased; and as there was little hope of making my escape at this season of the year, on account of the excessive heat, and the total want of water in the woods, I resolved to wait patiently until the rains had set in, or until some more favourable opportunity should present itself. But "hope deferred maketh the heart sick." This tedious procrastination from day to day, and the thoughts of travelling through the negro kingdoms in the rainy season, which was now fast approaching, made me very melancholy; and having passed a restless night, I found myself attacked, in the morning, by a smart fever. I had wrapped myself close up in my cloak with a view to induce perspiration, and was asleep, when a party of Moors entered the hut, and, with their usual rudeness, pulled the cloak from me. I made signs to them that I was sick, and wished much to sleep; but was solicited in vain: my distress was matter of sport to them, and they endeavoured to heighten it by every means in their power. This studied and degrading insolence, to which I was constantly exposed, was one of the bitterest ingredients in the cup of captivity, and often made life itself a burden to me. In those distressing moments I have frequently envied the situation of the slave, who, amidst all his calamities, could still possess the enjoyment of his own thoughts—a happiness to which I had for some time been a stranger.—Wearied out with such continual insults, and perhaps a little peevish from the fever, I trembled lest my passion might unawares overleap the bounds of prudence, and spur me to some sudden act of resentment, when death must be the inevitable consequence. In this perplexity, I left my hut, and walked to some shady trees at a little distance from the camp, where I lay down. But even here persecution followed me; and solitude was thought too great an indulgence for a distressed Christian. Ali's son, with a number of horse-

men, came galloping to the place, and ordered me to rise and follow them. I begged they would allow me to remain where I was, if it was only for a few hours; but they paid little attention to what I said; and, after a few threatening words, one of them pulled out a pistol from a leather bag, that was fastened to the pommel of his saddle, and, presenting it towards me, snapped it twice. He did this with so much indifference, that I really doubted whether the pistol was loaded; he cocked it a third time, and was striking the flint with a piece of steel, when I begged them to desist, and returned with them to the camp. When we entered Ali's tent, we found him much out of humour. He called for the Moor's pistol, and amused himself for some time with opening and shutting the pan; at length, taking up his powder-horn, he fresh primed it; and, turning round to me with a menacing look, said something in Arabic, which I did not understand. I desired my boy, who was sitting before the tent, to inquire what offence I had committed; when I was informed, that having gone out of the camp without Ali's permission, they suspected that I had some design of making my escape; and that, in future, if I was seen without the skirts of the camp, orders had been given that I should be shot by the first person that observed me.

In the afternoon the horizon, to the eastward, was thick and hazy, and the Moors prognosticated a sand wind; which accordingly commenced on the morning following, and lasted, with slight intermissions, for two days. The force of the wind was not in itself very great—it was what a seaman would have denominated a *stiff breeze*; but the quantity of sand and dust carried before it, was such as to darken the whole atmosphere. It swept along from east to west, in a thick and constant stream, and the air was at times so dark and full of sand, that it was difficult to discern the neighbouring tents. As the Moors always dress their victuals in the open air, this sand fell in great plenty amongst the koukous: it readily adhered to the skin, when moistened by perspiration, and formed a cheap and universal hair powder. The Moors wrap a cloth round their face, to prevent them from inhaling the sand, and always turn their backs to the wind when they look up, to prevent the sand falling into their eyes.

About this time, all the women of the camp had their feet, and the ends of their fingers, stained of a dark saffron colour. I could never ascertain whether this was done from motives of religion, or by way of ornament. The curiosity of the Moorish ladies had been very troublesome to me ever since my arrival at Benoum; and on the evening of the 25th (whether from the instigation of others, or impelled by their own ungovernable curiosity, or merely out of frolic, I cannot affirm), a party of them came into my hut, and gave me plainly to understand that the object of their visit was to ascertain, by actual inspection, whether the rite of circumcision extended to the Nazarenes (Christians), as well as to the followers of Mahomet. The reader will easily judge of my surprise at this unexpected declaration; and in order to avoid the proposed scrutiny, I thought it best to treat the business jocularly. I observed to them, that it was not customary in my country to give ocular demonstration in such cases, before so many beautiful women; but that if all of them would retire, except the young lady to whom I pointed (selecting the youngest and handsomest), I would satisfy her curiosity. The ladies enjoyed the jest, and went away laughing heartily; and the young damsel herself to whom I had given the preference (though she did not avail herself of the privilege of inspection), seemed no way displeas'd at the compliment; for she soon afterwards sent me some meal and milk for my supper.

March 28th.—This morning a large herd of cattle arrived from the eastward; and one of the drivers, to whom Ali had lent my horse, came into my hut with the leg of an antelope as a present, and told me that my horse was standing before Ali's tent. In a little time Ali sent one of his slaves to inform me, that in the afternoon I must be in readiness to ride out

with him, as he intended to show me to some of his women.

About four o'clock, Ali, with six of his courtiers, came riding to my hut, and told me to follow them. I readily complied. But here a new difficulty occurred. The Moors, accustomed to a loose and easy dress, could not reconcile themselves to the appearance of my *nankeen breeches*, which they said were not only inelegant, but, on account of their tightness, very indecent; and as this was a visit to ladies, Ali ordered my boy to bring out the loose cloak which I had always worn since my arrival at Benoum, and told me to wrap it close round me. We visited the tents of four different ladies, at every one of which I was presented with a bowl of milk and water. All these ladies were remarkably corpulent, which is considered here as the highest mark of beauty. They were very inquisitive, and examined my hair and skin with great attention, but affected to consider me as a sort of inferior being to themselves, and would knit their brows, and seem to shudder, when they looked at the whiteness of my skin. In the course of this evening's excursion, my dress and appearance afforded infinite mirth to the company, who galloped round me as if they were baiting a wild animal, twirling their muskets round their heads, and exhibiting various feats of activity and horsemanship, seemingly to display their superior prowess over a miserable captive.

The Moors are certainly very good horsemen. They ride without fear—their saddles being high before and behind, afford them a very secure seat; and if they chance to fall, the whole country is so soft and sandy, that they are very seldom hurt. Their greatest pride, and one of their principal amusements, is to put the horse to his full speed, and then stop him with a sudden jerk, so as frequently to bring him down upon his haunches. Ali always rode upon a milk-white horse, with its tail dyed red. He never walked, unless when he went to say his prayers; and even in the night, two or three horses were always kept ready saddled, at a little distance from his own tent. The Moors set a very high value upon their horses; for it is by their superior fleetness that they are enabled to make so many predatory excursions into the negro countries. They feed them three or four times a-day, and generally give them a large quantity of sweet milk in the evening, which the horses appear to relish very much.

April 3d.—This forenoon a child, which had been some time sickly, died in the next tent; and the mother and relations immediately began the death-howl. They were joined by a number of female visitors, who came on purpose to assist at this melancholy concert. I had no opportunity of seeing the burial, which is generally performed secretly, in the dusk of the evening, and frequently at only a few yards' distance from the tent. Over the grave they plant one particular shrub; and no stranger is allowed to pluck a leaf, or even to touch it—so great a veneration have they for the dead.

April 7th.—About four o'clock in the afternoon, a whirlwind passed through the camp with such violence, that it overturned three tents, and blew down one side of my hut. These whirlwinds come from the Great Desert, and at this season of the year are so common, that I have seen five or six of them at one time. They carry up quantities of sand to an amazing height, which resemble, at a distance, so many moving pillars of smoke.

The scorching heat of the sun, upon a dry and sandy country, makes the air insufferably hot. Ali having robbed me of my thermometer, I had no means of forming a comparative judgment; but in the middle of the day, when the beams of the vertical sun are seconded by the scorching wind from the desert, the ground is frequently heated to such a degree as not to be borne by the naked foot; even the negro slaves will not run from one tent to another without their sandals. At this time of the day the Moors lie stretched at length in their tents, either asleep, or unwilling to move; and I have often felt the wind so hot, that I could not

hold my hand in the current of air which came through the crevices of my hut without feeling sensible pain.

April 8th.—This day the wind blew from the south-west; and in the night there was a heavy shower of rain, accompanied with thunder and lightning.

April 10th.—In the evening the *tabala*, or large drum, was beat to announce a wedding, which was held at one of the neighbouring tents. A great number of people of both sexes assembled, but without that mirth and hilarity which take place at a negro wedding; here was neither singing nor dancing, nor any other amusement that I could perceive. A woman was beating the drum, and the other women joining at times like a chorus, by setting up a shrill scream, and, at the same time, moving their tongues from one side of the mouth to the other with great celerity. I was soon tired, and had returned into my hut, where I was sitting almost asleep, when an old woman entered, with a wooden bowl in her hand, and signified that she had brought me a present from the bride. Before I could recover from the surprise which this message created, the woman discharged the contents of the bowl full in my face. Finding that it was the same sort of holy water with which, among the Hottentots, a priest is said to sprinkle a newly married couple, I began to suspect that the old lady was actuated by mischief or malice; but she gave me seriously to understand that it was a nuptial benediction from the bride's own person, and which, on such occasions, is always received by the young unmarried Moors as a mark of distinguished favour. This being the case, I wiped my face, and sent my acknowledgments to the lady. The wedding drum continued to beat, and the women to sing, or rather whistle, all night. About nine in the morning, the bride was brought in state from her mother's tent, attended by a number of women, who carried her tent (a present from the husband), some bearing up the poles, others holding by the strings; and in this manner they marched, whistling as formerly, until they came to the place appointed for her residence, where they pitched the tent. The husband followed, with a number of men leading four bullocks, which they tied to the tent strings; and having killed another, and distributed the beef among the people, the ceremony was concluded.

## CHAPTER XI.

Occurrences at the Camp continued.—Information collected by the Author concerning Houssa and Tombuctoo; and the Situation of the latter.—The Route described from Morocco to Benoum.—The Author's Distress from Hunger.—Ali removes his camp to the Northward.—The Author is carried Prisoner to the new Encampment, and is presented to Queen Fatima.—Great Distress from the want of Water.

ONE whole month had now elapsed since I was led into captivity, during which time, each returning day brought me fresh distresses. I watched the lingering course of the sun with anxiety, and blessed his evening beams as they shed a yellow lustre along the sandy floor of my hut; for it was then that my oppressors left me, and allowed me to pass the sultry night in solitude and reflection.

About midnight, a bowl of kouskous with some salt and water was brought for me and my two attendants. This was our common fare, and it was all that was allowed us to allay the cravings of hunger, and support nature for the whole of the following day; for it is to be observed that this was the Mahomedan lent, and as the Moors keep the fast with a religious strictness, they thought it proper to compel me, though a Christian, to a similar observance. Time, however, somewhat reconciled me to my situation: I found that I could bear hunger and thirst better than I expected; and at length I endeavoured to beguile the tedious hours by learning to write Arabic. The people who came to see me soon made me acquainted with the characters; and I discovered, that by engaging their attention in this way, they were not so troublesome as otherwise they would

have been; indeed, when I observed any person whose countenance I thought bore malice towards me, I made it a rule to ask him, either to write in the sand himself, or to decipher what I had already written; and the pride of showing his superior attainments generally induced him to comply with my request.

April 14th.—As queen Fatima had not yet arrived, Ali proposed to go to the north, and bring her back with him; but as the place was two days' journey from Benowm, it was necessary to have some refreshment on the road; and Ali, suspicious of those about him, was so afraid of being poisoned, that he never ate any thing but what was dressed under his own immediate inspection. A fine bullock was therefore killed, and the flesh being cut up into thin slices, was dried in the sun; and this, with two bags of dry kouskous, formed his travelling provisions.

Previous to his departure, the black people of the town of Benowm came, according to their annual custom, to show their arms, and bring their stipulated tribute of corn and cloth. They were but badly armed; twenty-two with muskets, forty or fifty with bows and arrows, and nearly the same number of men and boys, with spears only. They arranged themselves before the tent, where they waited until their arms were examined, and some little disputes settled.

About midnight on the 16th, Ali departed quietly from Benowm, accompanied by a few attendants. He was expected to return in the course of nine or ten days.

April 18th.—Two days after the departure of Ali, a sheeref arrived with salt, and some other articles, from Walet, the capital of the kingdom of Biroo. As there was no tent appropriated for him, he took up his abode in the same hut with me. He seemed to be a well-informed man, and his acquaintance both with the Arabic and Bambarra tongues enabled him to travel with ease and safety through a number of kingdoms; for though his place of residence was Walet, he had visited Houssa, and had lived some years at Tombuctoo. Upon my inquiring so particularly about the distance from Walet to Tombuctoo, he asked me if I intended to travel that way; and being answered in the affirmative, he shook his head, and said, "it would not do;" for that Christians were looked upon there as the devil's children, and enemies to the Prophet. From him I learned the following particulars:—That Houssa was the largest town he had ever seen: that Walet was larger than Tombuctoo, but being remote from the Niger, and its trade consisting chiefly of salt, it was not so much resorted to by strangers: that between Benowm and Walet was ten days' journey; but the road did not lead through any remarkable towns, and travellers supported themselves by purchasing milk from the Arabs, who keep their herds by the watering-places: two of the days' journeys was over a sandy country, without water. From Walet to Tombuctoo was eleven days more; but water was more plentiful, and the journey was usually performed upon bullocks. He said there were many Jews at Tombuctoo, but they all spoke Arabic, and used the same prayers as the Moors. He frequently pointed his hand to the south-east quarter, or rather the east by south; observing, that Tombuctoo was situated in that direction; and though I made him repeat this information again and again, I never found him to vary more than half a point, which was to the southward.

April 24th.—This morning Sheeref Sidi Mahomed Moora Abdalla, a native of Morocco, arrived with five bullocks loaded with salt. He had formerly resided some months at Gibraltar, where he had picked up as much English as enabled him to make himself understood. He informed me, that he had been five months in coming from Santa Cruz; but that great part of the time had been spent in trading. When I requested him to enumerate the days employed in travelling from Morocco to Benowm, he gave them as follows:—To Swera, three days; to Agadier, three; to Jinikin, ten; to Wadmoon, four; to Lakeneig, five; to Zeerwin-zeriman, five; to Tisheet, ten; to Benowm, ten—in all, fifty days; but travellers usually rest a long while at Jinikin and

Tisheet—at the latter of which places they dig the rock salt, which is so great an article of commerce with the negroes.

In conversing with these sheerefs, and the different strangers that resorted to the camp, I passed my time with rather less uneasiness than formerly. On the other hand, as the dressing of my victuals was now left entirely to the care of Ali's slaves, over whom I had not the smallest control, I found myself but ill supplied, worse even than in the fast month: for two successive nights they neglected to send us our accustomed meal; and though my boy went to a small negro town near the camp, and begged with great diligence from hut to hut, he could only procure a few handfuls of ground nuts, which he readily shared with me. Hunger, at first, is certainly a very painful sensation; but when it has continued for some time, this pain is succeeded by languor and debility; in which case, a draught of water, by keeping the stomach distended, will greatly exhilarate the spirits, and remove for a short time every sort of uneasiness. Johnson and Demba were very much dejected. They lay stretched upon the sand, in a sort of torpid slumber; and even when the kouskous arrived, I found some difficulty in awakening them. I felt no inclination to sleep, but was affected with a deep convulsive respiration, like constant sighing; and, what alarmed me still more, a dimness of sight, and a tendency to faint, when I attempted to sit up. These symptoms did not go off until some time after I had received nourishment.

We had been for some days in daily expectation of Ali's return from Saheel (or the north country) with his wife Fatima. In the meanwhile Mansong, king of Bambarra, as I have related in Chapter VIII., had sent to Ali for a party of horse to assist in storming Gedingooma. With this demand Ali had not only refused to comply, but had treated the messengers with great haughtiness and contempt; upon which Mansong gave up all thoughts of taking the town, and prepared to chastise Ali for his contumacy.

Things were in this situation when, on the 29th of April, a messenger arrived at Benowm with the disagreeable intelligence that the Bambarra army was approaching the frontiers of Ludamar. This threw the whole country into confusion; and in the afternoon, Ali's son, with about twenty horsemen, arrived at Benowm. He ordered all the cattle to be driven away immediately, all the tents to be struck, and the people to hold themselves in readiness to depart at daylight the next morning.

April 30th.—At daybreak the whole camp was in motion. The baggage was carried upon bullocks—the two tent poles being placed one on each side, and the different wooden articles of the tent distributed in like manner; the tent cloth was thrown over all, and upon this was commonly placed one or two women; for the Moorish women are very bad walkers. The king's favourite concubines rode upon camels, with a saddle of a particular construction, and a canopy to shelter them from the sun. We proceeded to the northward until noon, when the king's son ordered the whole company, except two tents, to enter a thick low wood, which was upon our right. I was sent along with the two tents, and arrived in the evening at a negro town called Farani: here we pitched the tents in an open place, at no great distance from the town.

The hurry and confusion which attended this decampment, prevented the slaves from dressing the usual quantity of victuals; and lest their dry provisions should be exhausted before they reached their place of destination (for as yet none but Ali and the chief men knew whither we were going), they thought proper to make me observe this day as a day of fasting.

May 1st.—As I had some reason to suspect that this day was also to be considered as a fast, I went in the morning to the negro town of Farani, and begged some provisions from the dooty, who readily supplied my wants, and desired me to come to his house every day during my stay in the neighbourhood. These hospitable people are looked upon by the Moors as an abject

race of slaves, and are treated accordingly. Two of Ali's household slaves, a man and a woman, who had come along with the two tents, went this morning to water the cattle from the town wells, at which there began to be a great scarcity. When the negro women observed the cattle approaching, they took up their pitchers and ran with all possible haste towards the town; but before they could enter the gate, they were stopped by the slaves, who compelled them to bring back the water they had drawn for their own families, and empty it into the troughs for the cattle. When this was exhausted, they were ordered to draw water until such time as the cattle had all drunk; and the woman slave actually broke two wooden bowls over the heads of the black girls, because they were somewhat dilatory in obeying her commands.

May 3d.—We departed from the vicinity of Farani, and after a circuitous route through the woods, arrived at Ali's camp in the afternoon. This encampment was larger than that of Benoum, and was situated in the middle of a thick wood about two miles distant from a negro town, called Bubaker. I immediately waited upon Ali, in order to pay my respects to queen Fatima, who had come with him from Saheel. He seemed much pleased with my coming—shook hands with me—and informed his wife that I was the Christian. She was a woman of the Arab cast, with long black hair, and remarkably corpulent. She appeared at first rather shocked at the thought of having a Christian so near her: but when I had (by means of a negro boy, who spoke the Mandingo and Arabic tongues) answered a great many questions, which her curiosity suggested, respecting the country of the Christians, she seemed more at ease, and presented me with a bowl of milk, which I considered as a very favourable omen.

The heat was now almost insufferable—all nature seemed sinking under it. The distant country presented to the eye a dreary expanse of sand, with a few stunted trees and prickly bushes, in the shade of which the hungry cattle licked up the withered grass, while the camels and goats picked off the scanty foliage. The scarcity of water was greater here than at Benoum. Day and night the wells were crowded with cattle, lowing and fighting with each other to come at the troughs. Excessive thirst made many of them furious; others, being too weak to contend for the water, endeavoured to quench their thirst by devouring the black mud from the gutters near the wells—which they did with great avidity, though it was commonly fatal to them.

This great scarcity of water was felt severely by all the people of the camp, and by none more than myself; for though Ali allowed me a skin for containing water, and Fatima, once or twice, gave me a small supply when I was in distress, yet such was the barbarous disposition of the Moors at the wells, that, when my boy attempted to fill the skin, he commonly received a sound drubbing for his presumption. Every one was astonished that the slave of a Christian should attempt to draw water from wells which had been dug by the followers of the Prophet. This treatment, at length, so frightened the boy, that I believe he would sooner have perished with thirst than attempted again to fill the skin; he therefore contented himself with begging water from the negro slaves that attended the camp—and I followed his example—but with very indifferent success; for though I let no opportunity slip, and was very urgent in my solicitations, both to the Moors and negroes, I was but ill supplied, and frequently passed the night in the situation of Tantalus. No sooner had I shut my eyes, than fancy would convey me to the streams and rivers of my native land: there, as I wandered along the verdant brink, I surveyed the clear stream with transport, and hastened to swallow the delightful draught—but alas! disappointment awakened me, and I found myself a lonely captive, perishing of thirst amidst the wilds of Africa!

One night, having solicited in vain for water at the camp, and being quite feverish, I resolved to try my fortune at the wells, which were about half a mile dis-

tant from the camp. Accordingly, I set out about midnight, and being guided by the lowing of the cattle, soon arrived at the place—where I found the Moors very busy drawing water. I requested permission to drink, but was driven away with outrageous abuse. Passing, however, from one well to another, I came at last to one where there was only an old man and two boys. I made the same request to this man, and he immediately drew me up a bucket of water; but, as I was about to take hold of it, he recollected that I was a Christian, and fearing that his bucket might be polluted by my lips, he dashed the water into the trough, and told me to drink from thence. Though this trough was none of the largest, and three cows were already drinking in it, I resolved to come in for my share; and kneeling down, thrust my head between two of the cows, and drank with great pleasure, until the water was nearly exhausted, and the cows began to contend with each other for the last mouthful.

In adventures of this nature, I passed the sultry month of May, during which no material change took place in my situation. Ali still considered me as a lawful prisoner; and Fatima, though she allowed me a larger quantity of victuals than I had been accustomed to receive at Benoum, had as yet said nothing on the subject of my release. In the meantime, the frequent changes of the wind, the gathering clouds, and distant lightning, with other appearances of approaching rain, indicated that the wet season was at hand, when the Moors annually evacuate the country of the negroes, and return to the skirts of the Great Desert. This made me consider that my fate was drawing towards a crisis, and I resolved to wait for the event without any seeming uneasiness; but circumstances occurred which produced a change in my favour, more suddenly than I had foreseen, or had reason to expect. The case was this:—The fugitive Kaartans, who had taken refuge in Ludamar, as I have related in Chapter VIII., finding that the Moors were about to leave them, and dreading the resentment of their own sovereign, whom they had so basely deserted, offered to treat with Ali for two hundred Moorish horsemen, to co-operate with them in an effort to expel Daisy from Gedingooma; for until Daisy should be vanquished or humbled, they considered that they could neither return to their native towns, nor live in security in any of the neighbouring kingdoms. With a view to extort money from these people by means of this treaty, Ali dispatched his son to Jarra, and prepared to follow him in the course of a few days. This was an opportunity of too great consequence to me to be neglected. I immediately applied to Fatima (who, I found, had the chief direction in all affairs of state), and begged her interest with Ali to give me permission to accompany him to Jarra. This request, after some hesitation, was favourably received. Fatima looked kindly on me, and, I believe, was at length moved with compassion towards me. My bundles were brought from the large cow-skin bag that stood in the corner of Ali's tent, and I was ordered to explain the use of the different articles, and show the method of putting on the boots, stockings, &c.—with all which I cheerfully complied, and was told that, in the course of a few days, I should be at liberty to depart.

Believing, therefore, that I should certainly find the means of escaping from Jarra, if I should once get thither, I now freely indulged the pleasing hope that my captivity would soon terminate; and happily not having been disappointed in this idea, I shall pause, in this place, to collect and bring into one point of view, such observations on the Moorish character and country as I had no fair opportunity of introducing into the preceding narrative.

## CHAPTER XII.

Containing some farther miscellaneous Reflections on the Moorish Character and Manners.—Observations concerning the Great Desert, its Animals, wild and domestic, &c. &c.

THE Moors of this part of Africa are divided into many separate tribes, of which the most formidable, accord-

ing to what was reported to me, are those of Trasart and Il Braken, which inhabit the northern bank of the Senegal river. The tribes of Gedumah, Jaffnoo, and Ludamar, though not so numerous as the former, are nevertheless very powerful and warlike, and are each governed by a chief, or king, who exercises absolute jurisdiction over his own hordes, without acknowledging allegiance to a common sovereign. In time of peace, the employment of the people is pasturage. The Moors, indeed, subsist chiefly on the flesh of their cattle, and are always in the extreme of either gluttony or abstinence. In consequence of the frequent and severe fasts which their religion enjoins, and the toilsome journeys which they sometimes undertake across the desert, they are enabled to bear both hunger and thirst with surprising fortitude; but whenever opportunities occur of satisfying their appetite, they generally devour more at one meal than would serve an European for three. They pay but little attention to agriculture, purchasing their corn, cotton cloth, and other necessaries, from the negroes, in exchange for salt, which they dig from the pits in the Great Desert.

The natural barrenness of the country is such, that it furnishes but few materials for manufacture. The Moors, however, contrive to weave a strong cloth, with which they cover their tents; the thread is spun by their women from the hair of goats; and they prepare the hides of their cattle so as to furnish saddles, bridles, pouches, and other articles of leather. They are likewise sufficiently skilful to convert the native iron, which they procure from the negroes, into spears and knives, and also into pots for boiling their food; but their sabres, and other weapons, as well as their fire-arms and ammunition, they purchase from the Europeans, in exchange for the negro slaves which they obtain in their predatory excursions. Their chief commerce of this kind is with the French traders on the Senegal river.

The Moors are rigid Mahomedans, and possess, with the bigotry and superstition, all the intolerance, of their sect. They have no mosques at Benown, but perform their devotions in a sort of open shed, or inclosure, made of mats. The priest is, at the same time, schoolmaster to the juniors. His pupils assemble every evening before his tent; where, by the light of a large fire, made of brushwood and cow's dung, they are taught a few sentences from the Koran, and are initiated into the principles of their creed. Their alphabet differs but little from that in Richardson's Arabic Grammar. They always write with the vowel points. Their priests even affect to know something of foreign literature. The priest of Benown assured me, that he could read the writings of the Christians: he showed me a number of barbarous characters, which he asserted were the Roman alphabet; and he produced another specimen, equally unintelligible, which he declared to be the *Kallam il Indi*, or Persian. His library consisted of nine volumes in quarto; most of them, I believe, were books of religion—for the name of Mahomet appeared, in red letters, in almost every page of each. His scholars wrote their lessons upon thin boards; paper being too expensive for general use. The boys were diligent enough, and appeared to possess a considerable share of emulation—carrying their boards along over their shoulders, when about their common employments. When a boy has committed to memory a few of their prayers, and can read and write certain parts of the Koran, he is reckoned sufficiently instructed; and, with this slender stock of learning, commences his career of life. Proud of his acquirements, he surveys with contempt the unlettered negro; and embraces every opportunity of displaying his superiority over such of his countrymen as are not distinguished by the same accomplishments.

The education of the girls is neglected altogether: mental accomplishments are but little attended to by the women; nor is the want of them considered by the men as a defect in the female character. They are regarded, I believe, as an inferior species of animals; and seem to be brought up for no other purpose than

that of administering to the sensual pleasures of their imperious masters. Voluptuousness is therefore considered as their chief accomplishment, and slavish submission as their indispensable duty.

The Moors have singular ideas of feminine perfection. The gracefulness of figure and motion, and a countenance enlivened by expression, are by no means essential points in their standard—with them corpulence and beauty appear to be terms nearly synonymous. A woman, of even moderate pretensions, must be one who cannot walk without a slave under each arm to support her; and a perfect beauty is a load for a camel. In consequence of this prevalent taste for unwieldiness of bulk, the Moorish ladies take great pains to acquire it early in life; and for this purpose many of the young girls are compelled, by their mothers, to devour a great quantity of kouskous, and drink a large bowl of camel's milk, every morning. It is of no importance whether the girl has an appetite or not—the kouskous and milk must be swallowed, and obedience is frequently enforced by blows. I have seen a poor girl sit crying, with the bowl at her lips, for more than an hour, and her mother, with a stick in her hand, watching her all the while, and using the stick without mercy, whenever she observed that her daughter was not swallowing. This singular practice, instead of producing indigestion and disease, soon covers the young lady with that degree of plumpness, which, in the eye of a Moor, is perfection itself.

As the Moors purchase all their clothing from the negroes, the women are forced to be very economical in the article of dress. In general, they content themselves with a broad piece of cotton cloth, which is wrapped round the middle, and hangs down like a petticoat almost to the ground; and to the upper part of this are sewed two square pieces, one before, and the other behind, which are fastened together over the shoulders. The head dress is commonly a bandage of cotton cloth, with some parts of it broader than others, which serve to conceal the face when they walk in the sun: frequently, however, when they go abroad, they veil themselves from head to foot.

The employment of the women varies according to their degrees of opulence. Queen Fatima, and a few others of high rank, like the great ladies in some parts of Europe, pass their time chiefly in conversing with their visitors, performing their devotions, or admiring their charms in a looking-glass. The women of inferior class employ themselves in different domestic duties. They are very vain and talkative; and when any thing puts them out of humour, they commonly vent their anger upon their female slaves, over whom they rule with severe and despotic authority, which leads me to observe, that the condition of these poor captives is deplorably wretched. At daybreak, they are compelled to fetch water from the wells in large skins, called *giras*; and as soon as they have brought water enough to serve the family for the day, as well as the horses (for the Moors seldom give their horses the trouble of going to the wells), they are then employed in pounding the corn and dressing the victuals. This being always done in the open air, the slaves are exposed to the combined heat of the sun, the sand, and the fire. In the intervals, it is their business to sweep the tent, churn the milk, and perform other domestic offices. With all this they are badly fed, and oftentimes cruelly punished.

The men's dress, among the Moors of Ludamar, differs but little from that of the negroes, which has been already described, except that they have all adopted that characteristic of the Mahomedan sect, the *turban*, which is here universally made of white cotton cloth. Such of the Moors as have long beards, display them with a mixture of pride and satisfaction, as denoting an Arab ancestry. Of this number was Ali himself; but, among the generality of the people, the hair is short and bushy, and universally black. And here I may be permitted to observe, that if any one circumstance excited among them favourable thoughts towards my own person, it was my beard, which was now grown to an

enormous length, and was always beheld with approbation or envy. I believe, in my conscience, they thought it too good a beard for a Christian.

The only diseases which I observed to prevail among the Moors, were the intermittent fever and dysentery—for the cure of which, nostrums are sometimes administered by their old women, but in general nature is left to her own operations. Mention was made to me of the small-pox, as being sometimes very destructive; but it had not, to my knowledge, made its appearance in Ludamar, while I was in captivity. That it prevails, however, among some tribes of the Moors, and that it is frequently conveyed by them to the negroes in the southern states, I was assured on the authority of Dr Laidley, who also informed me that the negroes on the Gambia practise inoculation.

The administration of criminal justice, as far as I had opportunities of observing, was prompt and decisive; for, although civil rights were but little regarded in Ludamar, it was necessary, when crimes were committed, that examples should sometimes be made. On such occasions, the offender was brought before Ali, who pronounced, of his sole authority, what judgment he thought proper. But I understood that capital punishment was seldom or never inflicted, except on the negroes.

Although the wealth of the Moors consists chiefly in their numerous herds of cattle; yet, as the pastoral life does not afford full employment, the majority of the people are perfectly idle, and spend the day in trifling conversation about their horses, or in laying schemes of depredation on the negro villages.

The usual place of rendezvous for the indolent is the king's tent, where great liberty of speech seems to be exercised by the company towards each other; while, in speaking of their chief, they express but one opinion. In praise of their sovereign they are unanimous. Songs are composed in his honour, which the company frequently sing in concert—but they are so loaded with gross adulation, that no man but a Moorish despot could hear them without blushing. The king is distinguished by the fineness of his dress—which is composed of blue cotton cloth, brought from Tombuctoo, or white linen or muslin from Morocco. He has likewise a larger tent than any other person, with a white cloth over it; but in his usual intercourse with his subjects, all distinctions of rank are frequently forgotten. He sometimes eats out of the same bowl with his camel driver, and reposes himself, during the heat of the day, upon the same bed. The expenses of his government and household are defrayed by a tax upon his negro subjects, which is paid by every householder, either in corn, cloth, or gold dust; a tax upon the different Moorish korrees, or watering-places, which is commonly levied in cattle; and a tax upon all merchandise which passes through the kingdom, and is generally collected in kind. But a considerable part of the king's revenue arises from the plunder of individuals. The negro inhabitants of Ludamar, and the travelling merchants, are afraid of appearing rich; for Ali, who has spies stationed in the different towns to give him information concerning the wealth of his subjects, frequently invents some frivolous plea for seizing their property, and reducing the opulent to a level with their fellow-citizens.

Of the number of Ali's Moorish subjects, I had no means of forming a correct estimate. The military strength of Ludamar consists in cavalry. They are well mounted, and appear to be very expert in skirmishing and attacking by surprise. Every soldier furnishes his own horse, and finds his accoutrements, consisting of a large sabre, a double-barrelled gun, a small red leather bag for holding his balls, and a powder horn slung over the shoulder. He has no pay, nor any remuneration but what arises from plunder. This body is not very numerous; for when Ali made war upon Bambarra, I was informed that his whole force did not exceed two thousand cavalry. They constitute, however, by what I could learn, but a very small proportion of his Moorish subjects. The horses are very

beautiful, and so highly esteemed, that the negro princes will sometimes give from twelve to fourteen slaves for one horse.

Ludamar has for its northern boundary the great desert of Sahara. From the best inquiries I could make, this vast ocean of sand, which occupies so large a space in northern Africa, may be pronounced almost destitute of inhabitants, except where the scanty vegetation which appears in certain spots, affords pasturage for the flocks of a few miserable Arabs, who wander from one well to another. In other places, where the supply of water and pasturage is more abundant, small parties of the Moors have taken up their residence. Here they live, in independent poverty, secure from the tyrannical government of Barbary. But the greater part of the desert, being totally destitute of water, is seldom visited by any human being, unless where the trading caravans trace out their toilsome and dangerous route across it. In some parts of this extensive waste, the ground is covered with low stunted shrubs, which serve as landmarks for the caravans, and furnish the camels with a scanty forage. In other parts the disconsolate wanderer, wherever he turns, sees nothing around him but a vast interminable expanse of sand and sky—a gloomy and barren void, where the eye finds no particular object to rest upon, and the mind is filled with painful apprehensions of perishing with thirst. "Surrounded by this dreary solitude, the traveller sees the dead bodies of birds, that the violence of the wind has brought from happier regions; and, as he ruminates on the fearful length of his remaining passage, listens with horror to the voice of the driving blast—the only sound that interrupts the awful repose of the desert."<sup>\*</sup>

The few wild animals which inhabit these melancholy regions are the antelope and the ostrich; their swiftness of foot enabling them to reach the distant watering-places. On the skirts of the desert, where water is more plentiful, are found lions, panthers, elephants, and wild boars.

Of domestic animals, the only one that can endure the fatigue of crossing the desert is the camel. By the particular conformation of the stomach, he is enabled to carry a supply of water sufficient for ten or twelve days; his broad and yielding foot is well adapted for a sandy country; and, by a singular motion of his upper lip, he picks the smallest leaves from the thorny shrubs of the desert as he passes along. The camel is, therefore, the only beast of burden employed by the trading caravans, which traverse the desert in different directions, from Barbary to Nigritia. As this useful and docile creature has been sufficiently described by systematical writers, it is unnecessary for me to enlarge upon his properties. I shall only add, that his flesh, though to my own taste dry and unsavoury, is preferred by the Moors to any other; and that the milk of the female is in universal esteem, and is indeed sweet, pleasant, and nutritive.

I have observed that the Moors, in their complexion, resemble the Mulattoes of the West Indies; but they have something unpleasant in their aspect, which the Mulattoes have not. I fancied that I discovered in the features of most of them a disposition towards cruelty and low cunning; and I could never contemplate their physiognomy, without feeling sensible uneasiness. From the staring wildness of their eyes, a stranger would immediately set them down as a nation of lunatics. The treachery and malevolence of their character, are manifested in their plundering excursions against the negro villages. Oftentimes without the smallest provocation, and sometimes under the fairest professions of friendship, they will suddenly seize upon the negroes' cattle, and even on the inhabitants themselves. The negroes very seldom retaliate. The enterprising boldness of the Moors, their knowledge of the country, and, above all, the superior fleetness of their horses, make them such formidable enemies, that the petty negro states which border upon the desert are in continual terror while the Moorish tribes are in the vicinity, and are too much awed to think of resistance.

\* Proceedings of the African Association, Part I.

Like the roving Arabs, the Moors frequently remove from one place to another, according to the season of the year, or the convenience of pasturage. In the month of February, when the heat of the sun scorches up every sort of vegetation in the desert, they strike their tents, and approach the negro country to the south, where they reside until the rains commence, in the month of July. At this time, having purchased corn, and other necessaries, from the negroes, in exchange for salt, they again depart to the northward, and continue in the desert until the rains are over, and that part of the country becomes burnt up and barren.

This wandering and restless way of life, while it inures them to hardships, strengthens at the same time the bonds of their little society, and creates in them an aversion towards strangers which is almost insurmountable. Cut off from all intercourse with civilised nations, and boasting an advantage over the negroes, by possessing, though in a very limited degree, the knowledge of letters, they are at once the vainest and proudest, and perhaps the most bigoted, ferocious, and intolerant of all the nations on the earth—combining in their character the blind superstition of the negro, with the savage cruelty and treachery of the Arab.

It is probable that many of them had never beheld a white man, before my arrival at Benowm; but they had all been taught to regard the Christian name with inconceivable abhorrence, and to consider it nearly as lawful to murder a European as it would be to kill a dog. The melancholy fate of Major Houghton, and the treatment I experienced during my confinement among them, will, I trust, serve as a warning to future travellers to avoid this inhospitable district.

The reader may probably have expected from me a more detailed and copious account of the manners, customs, superstitions, and prejudices, of this secluded and singular people; but it must not be forgotten, that the wretchedness of my situation among them afforded me but few opportunities of collecting information. Some particulars, however, might be added in this place; but being equally applicable to the negroes to the southward, they will appear in a subsequent page.

### CHAPTER XIII.

Ali departs for Jarra, and the Author allowed to follow him thither.—The Author's faithful Servant, Demba, seized by Ali's order, and sent back into Slavery.—Ali returns to his Camp, and permits the Author to remain at Jarra, who thenceforward meditates his Escape.—Daisy, King of Kaarta, approaching with his Army towards Jarra, the inhabitants quit the Town, and the Author accompanies them in their Flight.—A Party of Moors overtake him at Queira.—He gets away from them at Daybreak.—Is again pursued by another Party, and robbed; but finally effects his Escape.

HAVING, as hath been related, obtained permission to accompany Ali to Jarra, I took leave of Queen Fatima, who, with much grace and civility, returned me part of my apparel; and the evening before my departure, my horse, with the saddle and bridle, were sent me by Ali's order.

Early on the morning of the 26th of May, I departed from the camp of Bubaker, accompanied by my two attendants, Johnson and Demba, and a number of Moors on horseback; Ali, with about fifty horsemen, having gone privately from the camp during the night. We stopped about noon at Farani, and were there joined by twelve Moors riding upon camels, and with them we proceeded to a watering-place in the woods, where we overtook Ali and his fifty horsemen. They were lodged in some low shepherds' tents near the wells. As the company was numerous, the tents could scarcely accommodate us all; and I was ordered to sleep in the open space, in the centre of the tents, where every one might observe my motions. During the night, there was much lightning from the north-east; and about daybreak a very heavy sand-wind commenced, which continued with great violence until four in the afternoon. The quantity of sand which passed to the

westward, in the course of this day, must have been prodigiously great. At times it was impossible to look up; and the cattle were so tormented by the particles lodging in their ears and eyes, that they ran about like mad creatures, and I was in continual danger of being trampled to death by them.

May 28th.—Early in the morning the Moors saddled their horses, and Ali's chief slave ordered me to get in readiness. In a little time the same messenger returned, and, taking my boy by the shoulder, told him in the Mandingo language, that "Ali was to be his master in future;" and then turning to me, "The business is settled at last," said he; "the boy, and every thing but your horse, goes back to Bubaker, but you may take the old fool (meaning Johnson the interpreter) with you to Jarra." I made him no answer; but being shocked beyond description at the idea of losing the poor boy, I hastened to Ali, who was at breakfast before his tent, surrounded by many of his courtiers. I told him (perhaps in rather too passionate a strain), that whatever imprudence I had been guilty of in coming into his country, I thought I had already been sufficiently punished for it by being so long detained, and then plundered of all my little property; which, however, gave me no uneasiness, when compared with what he had just now done to me. I observed, that the boy whom he had now seized upon, was not a slave, and had been accused of no offence: he was indeed one of my attendants, and his faithful services in that station had procured him his freedom: his fidelity and attachment had made him follow me into my present situation; and as he looked up to me for protection, I could not see him deprived of his liberty, without remonstrating against such an act as the height of cruelty and injustice. Ali made no reply, but with a haughty air and malignant smile, told his interpreter, that if I did not mount my horse immediately, he would send me back likewise. There is something in the frown of a tyrant which rouses the most secret emotions of the heart: I could not suppress my feelings; and for once entertained an indignant wish to rid the world of such a monster.

Poor Demba was not less affected than myself: he had formed a strong attachment towards me, and had a cheerfulness of disposition which often beguiled the tedious hours of captivity; he was likewise a proficient in the Bambarra tongue, and promised on that account to be of great utility to me in future. But it was in vain to expect any thing favourable to humanity from people who are strangers to its dictates. So, having shaken hands with this unfortunate boy, and blended my tears with his, assuring him, however, that I would do my utmost to redeem him, I saw him led off by three of Ali's slaves towards the camp at Bubaker.

When the Moors had mounted their horses, I was ordered to follow them; and after a toilsome journey through the woods, in a very sultry day, we arrived in the afternoon at a walled village called Doombani, where we remained two days, waiting for the arrival of some horsemen from the northward.

On the 1st of June, we departed from Doombani towards Jarra. Our company now amounted to two hundred men, all on horseback—for the Moors never use infantry in their wars. They appeared capable of enduring great fatigue; but from their total want of discipline, our journey to Jarra was more like a fox-chase than the march of an army.

At Jarra, I took up my lodging at the house of my old acquaintance, Daman Jumma, and informed him of every thing that had befallen me. I particularly requested him to use his interest with Ali to redeem my boy, and promised him a bill upon Dr Laidley for the value of two slaves, the moment he brought him to Jarra. Daman very readily undertook to negotiate the business, but found that Ali considered the boy as my principal interpreter, and was unwilling to part with him, lest he should fall a second time into my hands, and be instrumental in conducting me to Bambarra. Ali therefore put off the matter from day to day, but withal told Daman, that if he wished to purchase the

boy for himself, he should have him thereafter at the common price of a slave, which Daman agreed to pay for him whenever Ali should send him to Jarra.

The chief object of Ali, in this journey to Jarra, as I have already related, was to procure money from such of the Kaartans as had taken refuge in his country. Some of these had solicited his protection, to avoid the horrors of war, but by far the greatest number of them were dissatisfied men, who wished the ruin of their own sovereign. These people no sooner heard that the Bambarra army had returned to Sego without subduing Daisy, as was generally expected, than they resolved to make a sudden attack themselves upon him, before he could recruit his forces, which were now known to be much diminished by a bloody campaign, and in great want of provisions. With this view, they solicited the Moors to join them, and offered to hire of Ali two hundred horsemen, which Ali, with the warmest professions of friendship, agreed to furnish, upon condition that they should previously supply him with four hundred head of cattle, two hundred garments of blue cloth, and a considerable quantity of beads and ornaments. The raising this impost somewhat perplexed them; and in order to procure the cattle, they persuaded the king to demand one-half of the stipulated number from the people of Jarra, promising to replace them in a short time. Ali agreed to this proposal, and the same evening (June 2d) the drum was sent through the town, and the crier announced, that if any person suffered his cattle to go into the woods the next morning, before the king had chosen his quota of them, his house should be plundered, and his slaves taken from him. The people dared not disobey the proclamation; and next morning about two hundred of their best cattle were selected, and delivered to the Moors: the full complement was made up afterwards, by means equally unjust and arbitrary.

June 8th.—In the afternoon, Ali sent his chief slave to inform me that he was about to return to Bubaker; but as he would only stay there a few days to keep the approaching festival (*banna salee*), and then return to Jarra, I had permission to remain with Daman until his return. This was joyful news to me; but I had experienced so many disappointments that I was unwilling to indulge the hope of its being true, until Johnson came and told me that Ali, with part of the horsemen, were actually gone from the town, and that the rest were to follow him in the morning.

June 9th.—Early in the morning the remainder of the Moors departed from the town. They had, during their stay, committed many acts of robbery; and this morning, with the most unparalleled audacity, they seized upon three girls, who were bringing water from the wells, and carried them away into slavery.

The anniversary of *banna salee* at Jarra, very well deserved to be called a festival. The slaves were all finely clad on this occasion, and the householders vied with each other in providing large quantities of victuals, which they distributed to all their neighbours with the greatest profusion: hunger was literally banished from the town; man, woman, and child, bond and free, all had as much as they could eat.

June 12th.—Two people, dreadfully wounded, were discovered at a watering-place in the woods; one of them had just breathed his last, but the other was brought alive to Jarra. On recovering a little, he informed the people that he had fled through the woods from Kasson; that Daisy had made war upon Sambo, the king of that country; had surprised three of his towns, and put all the inhabitants to the sword. He enumerated by name many of the friends of the Jarra people, who had been murdered in Kasson. This intelligence made the death-howl universal in Jarra for the space of two days.

This piece of bad news was followed by another not less distressing. A number of runaway slaves arrived from Kaarta on the 14th, and reported that Daisy, having received information concerning the intended attack upon him, was about to visit Jarra. This made the negroes call upon Ali for the two hundred horse-

men, which he was to furnish them, according to engagement. But Ali paid very little attention to their remonstrances, and at last plainly told them, that his cavalry were otherwise employed. The negroes, thus deserted by the Moors, and fully apprised that the king of Kaarta would show them as little clemency as he had shown the inhabitants of Kasson, resolved to collect all their forces, and hazard a battle before the king, who was now in great distress for want of provisions, should become too powerful for them. They therefore assembled about eight hundred effective men in the whole, and with these they entered Kaarta on the evening of the 18th of June.

June 19th.—This morning the wind shifted to the south-west; and about two o'clock in the afternoon we had a heavy tornado, or thunder-squall, accompanied with rain, which greatly revived the face of nature, and gave a pleasant coolness to the air. This was the first rain that had fallen for many months.

As every attempt to redeem my boy had hitherto been unsuccessful, and in all probability would continue to prove so whilst I remained in the country, I found that it was necessary for me to come to some determination concerning my own safety, before the rains should be fully set in; for my landlord, seeing no likelihood of being paid for his trouble, began to wish me away—and Johnson, my interpreter, refusing to proceed, my situation became very perplexing. If I continued where I was, I foresaw that I must soon fall a victim to the barbarity of the Moors; and yet, if I went forward singly, it was evident that I must sustain great difficulties, both from the want of means to purchase the necessaries of life, and of an interpreter to make myself understood. On the other hand, to return to England without accomplishing the object of my mission, was worse than either. I therefore determined to avail myself of the first opportunity of escaping, and to proceed directly for Bambarra, as soon as the rains had set in for a few days, so as to afford me the certainty of finding water in the woods.

Such was my situation, when, on the evening of the 24th of June, I was startled by the report of some muskets close to the town, and, inquiring the reason, was informed that the Jarra army had returned from fighting Daisy, and that this firing was by way of rejoicing. However, when the chief men of the town had assembled, and heard a full detail of the expedition, they were by no means relieved from their uneasiness on Daisy's account. The deceitful Moors having drawn back from the confederacy, after being hired by the negroes, greatly dispirited the insurgents, who, instead of finding Daisy with a few friends concealed in the strong fortress of Gedingooma, had found him at a town near Joka, in the open country, surrounded by so numerous an army that every attempt to attack him was at once given up; and the confederates only thought of enriching themselves by the plunder of the small towns in the neighbourhood. They accordingly fell upon one of Daisy's towns, and carried off the whole of the inhabitants; but lest intelligence of this might reach Daisy, and induce him to cut off their retreat, they returned through the woods by night, bringing with them the slaves and cattle which they had captured.

June 26th.—This afternoon, a spy from Kaarta brought the alarming intelligence, that Daisy had taken Simbring in the morning, and would be in Jarra some time in the course of the ensuing day. A number of people were immediately stationed on the tops of the rocks, and in the different passages leading into the town, to give early intelligence of Daisy's motions, and the women set about making the necessary preparations for quitting the town as soon as possible. They continued beating corn, and packing up different articles, during the night; and early in the morning, nearly one-half of the townspeople took the road for Bambarra, by the way of Deena.

Their departure was very affecting—the women and children crying—the men sullen and dejected—and all of them looking back with regret on their native town, and on the wells and rocks, beyond which their ambi-

tion had never tempted them to stray, and where they had laid all their plans of future happiness—all of which they were now forced to abandon, and to seek shelter among strangers.

June 27th.—About eleven o'clock in the forenoon, we were alarmed by the sentinels, who brought information that Daisy was on his march towards Jarra, and that the confederate army had fled before him without firing a gun. The terror of the townspeople on this occasion is not easily to be described. Indeed, the screams of the women and children, and the great hurry and confusion that every where prevailed, made me suspect that the Kaartans had already entered the town; and although I had every reason to be pleased with Daisy's behaviour to me when I was at Kemmoo, I had no wish to expose myself to the mercy of his army, who might, in the general confusion, mistake me for a Moor. I therefore mounted my horse, and taking a large bag of corn before me, rode slowly along with the townspeople, until we reached the foot of a rocky hill, where I dismounted, and drove my horse up before me. When I had reached the summit, I sat down, and having a full view of the town and the neighbouring country, could not help lamenting the situation of the poor inhabitants, who were thronging after me, driving their sheep, cows, goats, &c., and carrying a scanty portion of provisions, and a few clothes. There was a great noise and crying every where upon the road; for many aged people and children were unable to walk, and these, with the sick, were obliged to be carried, otherwise they must have been left to certain destruction.

About five o'clock we arrived at a small farm belonging to the Jarra people, called Kadeeja; and here I found Daman and Johnson employed in filling large bags of corn, to be carried upon bullocks, to serve as provisions for Daman's family on the road.

June 28th.—At daybreak we departed from Kadeeja, and, having passed Troongoomba without stopping, arrived in the afternoon at Queira. I remained here two days in order to recruit my horse, which the Moors had reduced to a perfect Rosinante, and to wait for the arrival of some Mandingo negroes, who were going for Bambarra in the course of a few days.

On the afternoon of the 1st of July, as I was tending my horse in the fields, Ali's chief slave and four Moors arrived at Queira, and took up their lodging at the dooty's house. My interpreter, Johnson, who suspected the nature of this visit, sent two boys to overhear their conversation; from which he learnt that they were sent to convey me back to Bubaker. The same evening, two of the Moors came privately to look at my horse, and one of them proposed taking it to the dooty's hut, but the other observed that such a precaution was unnecessary, as I could never escape upon such an animal. They then inquired where I slept, and returned to their companions.

All this was like a stroke of thunder to me, for I dreaded nothing so much as confinement again among the Moors, from whose barbarity I had nothing but death to expect. I therefore determined to set off immediately for Bambarra—a measure which I thought offered almost the only chance of saving my life, and gaining the object of my mission. I communicated the design to Johnson, who, although he applauded my resolution, was so far from showing any inclination to accompany me, that he solemnly protested, he would rather forfeit his wages than go any farther. He told me that Daman had agreed to give him half the price of a slave for his service to assist in conducting a coffle of slaves to Gambia, and that he was determined to embrace the opportunity of returning to his wife and family.

Having no hopes, therefore, of persuading him to accompany me, I resolved to proceed by myself. About midnight I got my clothes in readiness, which consisted of two shirts, two pair of trousers, two pocket handkerchiefs, an upper and under waistcoat, a hat, and a pair of half-boots; these, with a cloak, constituted my whole wardrobe. And I had not one single bead, nor any other article of value in my possession, to purchase victuals for myself or corn for my horse.

About daybreak, Johnson, who had been listening to the Moors all night, came and whispered to me that they were asleep. The awful crisis was now arrived when I was again either to taste the blessing of freedom, or languish out my days in captivity. A cold sweat moistened my forehead as I thought on the dreadful alternative, and reflected, that, one way or the other, my fate must be decided in the course of the ensuing day. But to deliberate was to lose the only chance of escaping. So, taking up my bundle, I stepped gently over the negroes, who were sleeping in the open air, and having mounted my horse, I bade Johnson farewell, desiring him to take particular care of the papers I had entrusted him with, and inform my friends in Gambia that he had left me in good health, on my way to Bambarra.

I proceeded with great caution—surveying each bush, and frequently listening and looking behind me for the Moorish horsemen—until I was about a mile from the town, when I was surprised to find myself in the neighbourhood of a korree belonging to the Moors. The shepherds followed me for about a mile, hooting and throwing stones after me; and when I was out of their reach, and had begun to indulge the pleasing hopes of escaping, I was again greatly alarmed to hear somebody holloa behind me, and, looking back, I saw three Moors on horseback, coming after me at full speed, hooping and brandishing their double-barrelled guns. I knew it was in vain to think of escaping, and therefore turned back and met them: when two of them caught hold of my bridle, one on each side, and the third, presenting his musket, told me I must go back to Ali. When the human mind has for some time been fluctuating between hope and despair, tortured with anxiety, and hurried from one extreme to another, it affords a sort of gloomy relief to know the worst that can possibly happen: such was my situation. An indifference about life, and all its enjoyments, had completely benumbed my faculties, and I rode back with the Moors with apparent unconcern. But a change took place much sooner than I had any reason to expect. In passing through some thick bushes, one of the Moors ordered me to untie my bundle, and show them the contents. Having examined the different articles, they found nothing worth taking except my cloak, which they considered as a very valuable acquisition, and one of them pulling it from me, wrapped it about himself. This cloak had been of great use to me—it served to cover me from the rains in the day, and to protect me from the musquitoes in the night; I therefore earnestly begged him to return it, and followed him some little way to obtain it; but without paying any attention to my request, he and one of his companions rode off with their prize. When I attempted to follow them, the third, who had remained with me, struck my horse over the head, and, presenting his musket, told me I should proceed no farther. I now perceived that these men had not been sent by any authority to apprehend me, but had pursued me solely with the view to rob and plunder me. Turning my horse's head therefore once more towards the east, and observing the Moor follow the track of his confederates, I congratulated myself on having escaped with my life, though in great distress, from such a horde of barbarians.

I was no sooner out of sight of the Moor, than I struck into the woods to prevent being pursued, and kept pushing on, with all possible speed, until I found myself near some high rocks, which I remembered to have seen in my former route from Queira to Deena; and directing my course a little to the northward, I fortunately fell in with the path.

#### CHAPTER XIV.

The Author feels great Joy at his Deliverance, and proceeds through the Wilderness, but finds his Situation very deplorable.—Suffers greatly from Thirst, and faints on the Sand.—Recovers, and makes another Effort to push forward.—Is pro-

videntially relieved by a fall of Rain.—Arrives at a Foulah Village, where he is refused Relief by the Dooty, but obtains Food from a poor Woman.—Continues his Journey through the Wilderness, and the next Day lights on another Foulah Village, where he is hospitably received by one of the Shepherds.—Arrives on the third Day at a Negro Town called Wawra, tributary to the King of Bambarra.

It is impossible to describe the joy that arose in my mind, when I looked around and concluded that I was out of danger. I felt like one recovered from sickness; I breathed freer; I found unusual lightness in my limbs; even the desert looked pleasant; and I dreaded nothing so much as falling in with some wandering parties of Moors, who might convey me back to the land of thieves and murderers from which I had just escaped.

I soon became sensible, however, that my situation was very deplorable, for I had no means of procuring food, nor prospect of finding water. About ten o'clock, perceiving a herd of goats feeding close to the road, I took a circuitous route to avoid being seen; and continued travelling through the wilderness, directing my course, by compass, nearly east-south-east, in order to reach, as soon as possible, some town or village of the kingdom of Bambarra.

A little after noon, when the burning heat of the sun was reflected with double violence from the hot sand, and the distant ridges of the hills, seen through the ascending vapour, seemed to wave and fluctuate like the unsettled sea, I became faint with thirst, and climbed a tree in hopes of seeing distant smoke, or some other appearance of a human habitation—but in vain: nothing appeared all around but thick underwood, and hillocks of white sand.

About four o'clock I came suddenly upon a large herd of goats, and, pulling my horse into a bush, I watched to observe if the keepers were Moors or negroes. In a little time I perceived two Moorish boys, and with some difficulty persuaded them to approach me. They informed me that the herd belonged to Ali, and that they were going to Deena, where the water was more plentiful, and where they intended to stay until the rain had filled the pools in the desert. They showed me their empty water-skins, and told me that they had seen no water in the woods. This account afforded me but little consolation; however, it was in vain to repine, and I pushed on as fast as possible, in hopes of reaching some watering-place in the course of the night. My thirst was by this time become insufferable; my mouth was parched and inflamed; a sudden dimness would frequently come over my eyes, with other symptoms of fainting; and my horse being very much fatigued, I began seriously to apprehend that I should perish of thirst. To relieve the burning pain in my mouth and throat, I chewed the leaves of different shrubs, but found them all bitter, and of no service to me.

A little before sunset, having reached the top of a gentle rising, I climbed a high tree, from the topmost branches of which I cast a melancholy look over the barren wilderness, but without discovering the most distant trace of a human dwelling. The same dismal uniformity of shrubs and sand every where presented itself, and the horizon was as level and uninterrupted as that of the sea.

Descending from the tree, I found my horse devouring the stubble and brushwood with great avidity; and as I was now too faint to attempt walking, and my horse too much fatigued to carry me, I thought it but an act of humanity, and perhaps the last I should ever have it in my power to perform, to take off his bridle and let him shift for himself; in doing which I was suddenly affected with sickness and giddiness, and, falling upon the sand, felt as if the hour of death was fast approaching. Here, then, thought I, after a short but ineffectual struggle, terminate all my hopes of being useful in my day and generation: here must the short span of my life come to an end. I cast (as I believed) a last look on the surrounding scene, and, whilst I reflected on the awful change that was about to take place, this

world with its enjoyments seemed to vanish from my recollection. Nature, however, at length resumed its functions, and on recovering my senses, I found myself stretched upon the sand, with the bridle still in my hand, and the sun just sinking behind the trees. I now summoned all my resolution, and determined to make another effort to prolong my existence; and as the evening was somewhat cool, I resolved to travel as far as my limbs would carry me, in hopes of reaching (my only resource) a watering-place. With this view, I put the bridle on my horse, and driving him before me, went slowly along for about an hour, when I perceived some lightning from the north-east—a most delightful sight, for it promised rain. The darkness and lightning increased very rapidly, and in less than an hour I heard the wind roaring among the bushes. I had already opened my mouth to receive the refreshing drops which I expected, but I was instantly covered with a cloud of sand, driven with such force by the wind as to give a very disagreeable sensation to my face and arms, and I was obliged to mount my horse, and stop under a bush, to prevent being suffocated. The sand continued to fly in amazing quantities for nearly an hour, after which I again set forward, and travelled with difficulty until ten o'clock. About this time I was agreeably surprised by some very vivid flashes of lightning, followed by a few heavy drops of rain. In a little time the sand ceased to fly, and I alighted, and spread out all my clean clothes to collect the rain, which at length I saw would certainly fall. For more than an hour it rained plentifully, and I quenched my thirst by wringing and sucking my clothes.

There being no moon, it was remarkably dark, so that I was obliged to lead my horse, and direct my way by the compass, which the lightning enabled me to observe. In this manner I travelled with tolerable expedition until past midnight, when, the lightning becoming more distant, I was under the necessity of groping along, to the no small danger of my hands and eyes. About two o'clock my horse started at something, and looking round, I was not a little surprised to see a light at a short distance among the trees; and supposing it to be a town, I groped along the sand in hopes of finding corn-stalks, cotton, or other appearances of cultivation, but found none. As I approached, I perceived a number of other lights in different places, and began to suspect that I had fallen upon a party of Moors. However, in my present situation, I was resolved to see who they were, if I could do it with safety. I accordingly led my horse cautiously towards the light, and heard, by the lowing of the cattle, and the clamorous tongues of the herdsmen, that it was a watering-place, and most likely belonged to the Moors. Delightful as the sound of the human voice was to me, I resolved once more to strike into the woods, and rather run the risk of perishing of hunger than trust myself again in their hands; but being still thirsty, and dreading the approach of the burning day, I thought it prudent to search for the wells, which I expected to find at no great distance. In this pursuit, I inadvertently approached so near to one of the tents as to be perceived by a woman, who immediately screamed out. Two people came running to her assistance from some of the neighbouring tents, and passed so very near to me that I thought I was discovered, and hastened again into the woods.

About a mile from this place, I heard a loud and confused noise somewhere to the right of my course, and in a short time was happy to find it was the croaking of frogs, which was heavenly music to my ears. I followed the sound, and at daybreak arrived at some shallow muddy pools, so full of frogs that it was difficult to discern the water. The noise they made frightened my horse, and I was obliged to keep them quiet, by beating the water with a branch, until he had drunk. Having here quenched my thirst, I ascended a tree, and the morning being calm, I soon perceived the smoke of the watering-place which I had passed in the night, and observed another pillar of smoke east-south-east, distant twelve or fourteen miles. Towards this I

directed my route, and reached the cultivated ground a little before eleven o'clock, where, seeing a number of negroes at work planting corn, I inquired the name of the town, and was informed that it was a Foulah village belonging to Ali, called Shrilla. I had now some doubts about entering it; but my horse being very much fatigued, and the day growing hot—not to mention the pangs of hunger which began to assail me—I resolved to venture; and accordingly rode up to the dooty's house, where I was unfortunately denied admittance, and could not obtain even a handful of corn, either for myself or horse. Turning from this inhospitable door, I rode slowly out of the town, and, perceiving some low scattered huts without the walls, I directed my route towards them, knowing that in Africa, as well as in Europe, hospitality does not always prefer the highest dwellings. At the door of one of these huts, an old motherly-looking woman sat, spinning cotton. I made signs to her that I was hungry, and inquired if she had any victuals with her in the hut. She immediately laid down her distaff, and desired me, in Arabic, to come in. When I had seated myself upon the floor, she set before me a dish of kouskous that had been left the preceding night, of which I made a tolerable meal; and in return for this kindness I gave her one of my pocket handkerchiefs, begging at the same time a little corn for my horse, which she readily brought me.

Overcome with joy at so unexpected a deliverance, I lifted up my eyes to heaven, and, whilst my heart swelled with gratitude, I returned thanks to that gracious and bountiful Being whose power had supported me under so many dangers, and had now spread for me a table in the wilderness.

Whilst my horse was feeding, the people began to assemble, and one of them whispered something to my hostess which very much excited her surprise. Though I was not well acquainted with the Foulah language, I soon discovered that some of the men wished to apprehend and carry me back to Ali, in hopes, I suppose, of receiving a reward. I therefore tied up the corn; and lest any one should suspect I had run away from the Moors, I took a northerly direction, and went cheerfully along, driving my horse before me, followed by all the boys and girls of the town. When I had travelled about two miles, and got quit of all my troublesome attendants, I struck again into the woods, and took shelter under a large tree, where I found it necessary to rest myself—a bundle of twigs serving me for a bed, and my saddle for a pillow.

I was awakened about two o'clock by three Foulahs, who, taking me for a Moor, pointed to the sun, and told me it was time to pray. Without entering into conversation with them, I saddled my horse, and continued my journey. I travelled over a level, but more fertile country, than I had seen for some time, until sunset, when, coming to a path that took a southerly direction, I followed it until midnight, at which time I arrived at a small pool of rain-water, and the wood being open, I determined to rest by it for the night. Having given my horse the remainder of the corn, I made my bed as formerly; but the mosquitoes and flies from the pool prevented sleep for some time, and I was twice disturbed in the night by wild beasts, which came very near, and whose howlings kept my horse in continual terror.

July 4th.—At daybreak I pursued my course through the woods as formerly; saw numbers of antelopes, wild hogs, and ostriches—but the soil was more hilly, and not so fertile as I had found it the preceding day. About eleven o'clock I ascended an eminence, where I climbed a tree, and discovered at about eight miles distance an open part of the country, with several red spots, which I concluded were cultivated land, and, directing my course that way, came to the precincts of a watering place about one o'clock. From the appearance of the place, I judged it to belong to the Foulahs, and was hopeful that I should meet a better reception than I had experienced at Shrilla. In this I was not deceived, for one of the shepherds invited me to come

into his tent, and partake of some dates. This was one of those low Foulah tents in which there is room just sufficient to sit upright, and in which the family, the furniture, &c., seem huddled together like so many articles in a chest. When I had crept upon my hands and knees into this humble habitation, I found that it contained a woman and three children, who, together with the shepherd and myself, completely occupied the floor. A dish of boiled corn and dates was produced, and the master of the family, as is customary in this part of the country, first tasted it himself and then desired me to follow his example. Whilst I was eating, the children kept their eyes fixed upon me, and no sooner did the shepherd pronounce the word *Naxarani*, than they began to cry, and their mother crept slowly towards the door, out of which she sprang like a greyhound, and was instantly followed by her children. So frightened were they at the very name of a Christian, that no entreaties could induce them to approach the tent. Here I purchased some corn for my horse, in exchange for some brass buttons, and having thanked the shepherd for his hospitality, struck again into the woods. At sunset, I came to a road that took the direction for Bambarra, and resolved to follow it for the night—but about eight o'clock, hearing some people coming from the southward, I thought it prudent to hide myself among some thick bushes near the road. As these thickets are generally full of wild beasts, I found my situation rather unpleasant—sitting in the dark, holding my horse by the nose with both hands, to prevent him from neighing, and equally afraid of the natives without and the wild beasts within. My fears, however, were soon dissipated—for the people, after looking round the thicket and perceiving nothing, went away, and I hastened to the more open parts of the wood, where I pursued my journey east-south-east, until past midnight, when the joyful cry of frogs induced me once more to deviate a little from my route, in order to quench my thirst. Having accomplished this from a large pool of rain water, I sought for an open place, with a single tree in the midst, under which I made my bed for the night. I was disturbed by some wolves towards morning, which induced me to set forward a little before day—and having passed a small village called Wassalita, I came about ten o'clock (July 5th) to a negro town called Wawra, which properly belongs to Kaarta, but was at this time tributary to Mansong, king of Bambarra.

#### CHAPTER XV.

The Author proceeds to Wassiboo.—Is joined by some fugitive Kaartans, who accompany him in his Route through Bambarra.—Discovers the Niger.—Some Account of Sego, the Capital of Bambarra.—Mansong, the King, refuses to see the Author, but sends him a Present.—Great Hospitality of a Negro Woman.

WAWRA is a small town surrounded with high walls, and inhabited by a mixture of Mandingoes and Foulahs. The inhabitants employ themselves chiefly in cultivating corn, which they exchange with the Moors for salt. Here, being in security from the Moors, and very much fatigued, I resolved to rest myself; and meeting with a hearty welcome from the dooty, whose name was Flancharee, I laid myself down upon a bullock's hide, and slept soundly for about two hours. The curiosity of the people would not allow me to sleep any longer. They had seen my saddle and bridle, and were assembled in great numbers to learn who I was, and whence I came. Some were of opinion that I was an Arab; others insisted that I was some Moorish sultan; and they continued to debate the matter with such warmth that the noise awoke me. The dooty (who had formerly been at Gambia) at last interposed in my behalf, and assured them that I was certainly a white man; but he was convinced, from my appearance, that I was a very poor one.

In the course of the day, several women, hearing that I was going to Sego, came and begged me to inquire of Mansong, the king, what was become of their children.

One woman, in particular, told me that her son's name was Mamadee—that he was no heathen, but prayed to God morning and evening—and had been taken from her about three years ago by Mansong's army, since which she had never heard of him. She said, she often dreamed about him; and begged me, if I should see him, either in Bambarra or in my own country, to tell him that his mother and sister were still alive. In the afternoon, the dooty examined the contents of the leather bag in which I had packed up my clothes; but finding nothing that was worth taking, he returned it, and told me to depart in the morning.

July 6th.—It rained very much in the night, and at daylight I departed, in company with a negro, who was going to a town called Dingyee for corn; but we had not proceeded above a mile, before the ass upon which he rode threw him off, and he returned, leaving me to prosecute the journey by myself.

I reached Dingyee about noon; but the dooty and most of the inhabitants had gone into the fields to cultivate corn. An old Foulah, observing me wandering about the town, desired me to come to his hut, where I was well entertained: and the dooty, when he returned, sent me some victuals for myself, and corn for my horse.

July 7th.—In the morning, when I was about to depart, my landlord, with a great deal of diffidence, begged me to give him a lock of my hair. He had been told, he said, that white men's hair made a saphie, that would give to the possessor all the knowledge of white men. I had never before heard of so simple a mode of education, but instantly complied with the request; and my landlord's thirst for learning was such, that, with cutting and pulling, he cropped one side of my head pretty closely; and would have done the same with the other, had I not signified my disapprobation by putting on my hat, and assuring him, that I wished to reserve some of this precious merchandise for a future occasion.

I reached a small town called Wassiboo about twelve o'clock, where I was obliged to stop until an opportunity should offer of procuring a guide to Satilé, which is distant a very long day's journey, through woods without any beaten path. I accordingly took up my residence at the dooty's house, where I staid four days, during which time I amused myself by going to the fields with the family to plant corn. Cultivation is carried on here on a very extensive scale; and, as the natives themselves express it, "hunger is never known." In cultivating the soil, the men and women work together. They use a large sharp hoe, much superior to that used in Gambia; but they are obliged, for fear of the Moors, to carry their arms with them to the field. The master, with the handle of his spear, marks the field into regular plats, one of which is assigned to every three slaves.

On the evening of the 11th, eight of the fugitive Kaartans arrived at Wassiboo. They had found it impossible to live under the tyrannical government of the Moors, and were now going to transfer their allegiance to the king of Bambarra. They offered to take me along with them as far as Satilé, and I accepted the offer.

July 12th.—At daybreak we set out, and travelled with uncommon expedition until sunset. We stopped only twice in the course of the day; once at a watering-place in the woods, and another time at the ruins of a town, formerly belonging to Daisy, called *Illu-Compe* (the corn town). When we arrived in the neighbourhood of Satilé, the people who were employed in the corn fields, seeing so many horsemen, took us for a party of Moors, and ran screaming away from us. The whole town was instantly alarmed, and the slaves were seen, in every direction, driving the cattle and horses towards the town. It was in vain that one of our company galloped up to undeceive them—it only frightened them the more; and when we arrived at the town, we found the gates shut, and the people all under arms. After a long parley, we were permitted to enter; and as there was every appearance of a heavy tornado, the dooty allowed us to sleep in his *baloon*, and gave us each a bullock's hide for a bed.

July 13th.—Early in the morning we again set forward. The roads were wet and slippery, but the country was very beautiful, abounding with rivulets, which were increased by the rain into rapid streams. About ten o'clock we came to the ruins of a village which had been destroyed by war about six months before; and in order to prevent any town from being built there in future, the large bentang tree, under which the natives spent the day, had been burnt down, the wells filled up, and every thing that could make the spot desirable completely destroyed.

About noon, my horse was so much fatigued that I could not keep up with my companions; I therefore dismounted, and desired them to ride on, telling them that I would follow as soon as my horse had rested a little. But I found them unwilling to leave me; the lions, they said, were very numerous in those parts, and though they might not so readily attack a body of people, they would soon find out an individual: it was therefore agreed, that one of the company should stay with me to assist in driving my horse, while the others passed on to Galloo to procure lodgings, and collect grass for the horses before night. Accompanied by this worthy negro, I drove my horse before me until about four o'clock, when we came in sight of Galloo, a considerable town, standing in a fertile and beautiful valley surrounded with high rocks.

As my companions had thoughts of settling in this neighbourhood, they had a fine sheep given them by the dooty; and I was fortunate enough to procure plenty of corn for my horse. Here they blow upon elephants' teeth when they announce evening prayers, in the same manner as at Kemnoo.

Early next morning (July 14th), having first returned many thanks to our landlord for his hospitality, while my fellow-travellers offered up their prayers that he might never want, we set forward, and about three o'clock arrived at Moorja, a large town, famous for its trade in salt, which the Moors bring here in great quantities, to exchange for corn and cotton cloth. As most of the people here are Mahomedans, it is not allowed to the kafirs to drink beer, which they call *neodollo* (corn spirit), except in certain houses. In one of these I saw about twenty people sitting round large vessels of this beer with the greatest conviviality, many of them in a state of intoxication. As corn is plentiful, the inhabitants are very liberal to strangers. I believe we had as much corn and milk sent us by different people as would have been sufficient for three times our number; and though we remained here two days, we experienced no diminution of their hospitality.

On the morning of the 16th we again set forward, accompanied by a cofle of fourteen asses, loaded with salt, bound for Sansanding. The road was particularly romantic, between two rocky hills; but the Moors sometimes lie in wait here to plunder strangers. As soon as we had reached the open country, the master of the salt cofle thanked us for having staid with him so long, and now desired us to ride on. The sun was almost set before we reached Datliboo. In the evening we had a most tremendous tornado. The house in which we lodged, being flat-roofed, admitted the rain in streams; the floor was soon ankle-deep, the fire extinguished, and we were left to pass the night upon some bundles of firewood that happened to lie in a corner.

July 17th.—We departed from Datliboo, and about ten o'clock passed a large cofle returning from Segu, with corn-hoes, mats, and other household utensils. At five o'clock we came to a large village where we intended to pass the night, but the dooty would not receive us. When we departed from this place, my horse was so much fatigued that I was under the necessity of driving him, and it was dark before we reached Fanimboo, a small village; the dooty of which no sooner heard that I was a white man, than he brought out three old muskets, and was much disappointed when he was told that I could not repair them.

July 18th.—We continued our journey; but, owing to a light supper the preceding night, we felt ourselves rather hungry this morning, and endeavoured to pro-

cure some corn at a village, but without success. The towns were now more numerous, and the land that is not employed in cultivation affords excellent pasturage for large herds of cattle; but, owing to the great concourse of people daily going to and returning from Segó, the inhabitants are less hospitable to strangers.

My horse becoming weaker and weaker every day, was now of very little service to me; I was obliged to drive him before me for the greater part of the day, and did not reach Geosorro until eight o'clock in the evening. I found my companions wrangling with the dooty, who had absolutely refused to give or sell them any provisions; and as none of us had tasted victuals for the last twenty-four hours, we were by no means disposed to fast another day, if we could help it. But finding our entreaties without effect, and being very much fatigued, I fell asleep, from which I was awakened about midnight with the joyful information, *Kimne wata!* ("The victuals are come!") This made the remainder of the night pass away pleasantly; and at daybreak, July 19th, we resumed our journey, proposing to stop at a village called Doolinkeaboo for the night following. My fellow-travellers, having better horses than myself, soon left me; and I was walking barefoot, driving my horse, when I was met by a cofle of slaves, about seventy in number, coming from Segó. They were tied together by their necks with thongs of a bullock's hide, twisted like a rope—seven slaves upon a thong, and a man with a musket between every seven. Many of the slaves were ill conditioned, and a great number of them women. In the rear came Sidi Mahomed's servant, whom I remembered to have seen at the camp of Benown: he presently knew me, and told me that these slaves were going to Morocco, by the way of Ludamar and the Great Desert.

In the afternoon, as I approached Doolinkeaboo, I met about twenty Moors on horseback, the owners of the slaves I had seen in the morning; they were well armed with muskets, and were very inquisitive concerning me, but not so rude as their countrymen generally are. From them I learned that Sidi Mahomed was not at Segó, but had gone to Kancaba for his dust.

When I arrived at Doolinkeaboo, I was informed that my fellow-travellers had gone on; but my horse was so much fatigued that I could not possibly proceed after them. The dooty of the town, at my request, gave me a draught of water, which is generally looked upon as an earnest of greater hospitality, and I had no doubt of making up for the toils of the day by a good supper and a sound sleep: unfortunately I had neither one nor the other. The night was rainy and tempestuous, and the dooty limited his hospitality to the draught of water.

July 20th.—In the morning I endeavoured, both by entreaties and threats, to procure some victuals from the dooty, but in vain. I even begged some corn from one of his female slaves, as she was washing it at the well, and had the mortification to be refused. However, when the dooty was gone to the fields, his wife sent me a handful of meal, which I mixed with water, and drank for breakfast. About eight o'clock I departed from Doolinkeaboo, and at noon stopped a few minutes at a large korree, where I had some milk given me by the Foulahs; and hearing that two negroes were going from thence to Segó, I was happy to have their company, and we set out immediately. About four o'clock we stopped at a small village, where one of the negroes met with an acquaintance, who invited us to a sort of public entertainment, which was conducted with more than common propriety. A dish, made of sour milk and meal, called *sinkatoo*, and beer made from their corn, was distributed with great liberality, and the women were admitted into the society—a circumstance I had never before observed in Africa. There was no compulsion—every one was at liberty to drink as he pleased—they nodded to each other when about to drink, and on setting down the calabash, commonly said *Berka*. ("Thank you.") Both men and women appeared to be somewhat intoxicated, but they were far from being quarrelsome.

Departing from thence, we passed several large villages, where I was constantly taken for a Moor, and became the subject of much merriment to the Bambarans, who, seeing me drive my horse before me, laughed heartily at my appearance. He has been at Mecca, says one, you may see that by his clothes: another asked me if my horse was sick: a third wished to purchase it, &c.—so that, I believe, the very slaves were ashamed to be seen in my company. Just before it was dark, we took up our lodging for the night at a small village, where I procured some victuals for myself and some corn for my horse, at the moderate price of a button; and was told that I should see the Niger (which the negroes call *Joliba*, or the Great Water) early the next day. The lions are here very numerous: the gates are shut a little after sunset, and nobody allowed to go out. The thoughts of seeing the Niger in the morning, and the troublesome buzzing of musquitoes, prevented me from shutting my eyes during the night; and I had saddled my horse, and was in readiness before daylight—but, on account of the wild beasts, we were obliged to wait until the people were stirring, and the gates opened. This happened to be a market-day at Segó, and the roads were every where filled with people carrying different articles to sell. We passed four large villages, and at eight o'clock saw the smoke over Segó.

As we approached the town, I was fortunate enough to overtake the fugitive Kaartans, to whose kindness I had been so much indebted in my journey through Bambarra. They readily agreed to introduce me to the king; and we rode together through some marshy ground, where, as I was anxiously looking around for the river, one of them called out, *Geo affilli!* ("See the water!") and, looking forwards, I saw with infinite pleasure the great object of my mission—the long-sought-for majestic Niger, glittering to the morning sun, as broad as the Thames at Westminster, and flowing slowly to the eastward. I hastened to the brink, and having drunk of the water, lifted up my fervent thanks in prayer to the Great Ruler of all things, for having thus far crowned my endeavours with success.

The circumstance of the Niger's flowing towards the east, and its collateral points, did not however excite my surprise—for, although I had left Europe in great hesitation on this subject, and rather believed that it ran in the contrary direction, I had made such frequent inquiries during my progress concerning this river, and received from negroes of different nations such clear and decisive assurances that its general course was towards the rising sun, as scarce left any doubt on my mind, and more especially as I knew that Major Houghton had collected similar information, in the same manner.

Segó, the capital of Bambarra, at which I had now arrived, consists, properly speaking, of four distinct towns—two on the northern bank of the Niger, called Segó Korro, and Segó Boo; and two on the southern bank, called Segó Soo Korro, and Segó See Korro. They are all surrounded with high mud walls. The houses are built of clay, of a square form, with flat roofs—some of them have two stories, and many of them are whitewashed. Besides these buildings, Moorish mosques are seen in every quarter; and the streets, though narrow, are broad enough for every useful purpose, in a country where wheel carriages are entirely unknown. From the best inquiries I could make, I have reason to believe that Segó contains altogether about thirty thousand inhabitants. The king of Bambarra constantly resides at Segó See Korro. He employs a great many slaves in conveying people over the river, and the money they receive (though the fare is only ten kowrie shells for each individual) furnishes a considerable revenue to the king in the course of a year. The canoes are of a singular construction, each of them being formed of the trunks of two large trees rendered concave, and joined together, not side by side, but endways—the junction being exactly across the middle of the canoe: they are therefore very long, and disproportionately narrow, and have neither decks nor masts: they are, however, very roomy, for I observed in one

of them four horses, and several people, crossing over the river. When we arrived at this ferry, with a view to pass over to that part of the town in which the king resides, we found a great number waiting for a passage: they looked at me with silent wonder, and I distinguished with concern many Moors among them. There were three different places of embarkation, and the ferrymen were very diligent and expeditious; but, from the crowd of people, I could not immediately obtain a passage, and sat down upon the bank of the river to wait for a more favourable opportunity. The view of this extensive city—the numerous canoes upon the river—the crowded population, and the cultivated state of the surrounding country—formed altogether a prospect of civilisation and magnificence which I little expected to find in the bosom of Africa.

I waited more than two hours without having an opportunity of crossing the river, during which time the people who had crossed carried information to Mansong, the king, that a white man was waiting for a passage, and was coming to see him. He immediately sent over one of his chief men, who informed me that the king could not possibly see me, until he knew what had brought me into his country; and that I must not presume to cross the river without the king's permission. He therefore advised me to lodge at a distant village, to which he pointed, for the night, and said, that in the morning he would give me further instructions how to conduct myself. This was very discouraging. However, as there was no remedy, I set off for the village, where I found, to my great mortification, that no person would admit me into his house. I was regarded with astonishment and fear, and was obliged to sit all day without victuals in the shade of a tree; and the night threatened to be very uncomfortable—for the wind rose, and there was great appearance of a heavy rain—and the wild beasts are so very numerous in the neighbourhood, that I should have been under the necessity of climbing up the tree, and resting amongst the branches. About sunset, however, as I was preparing to pass the night in this manner, and had turned my horse loose that he might graze at liberty, a woman, returning from the labours of the field, stopped to observe me, and perceiving that I was weary and dejected, inquired into my situation, which I briefly explained to her; whereupon, with looks of great compassion, she took up my saddle and bridle, and told me to follow her. Having conducted me into her hut, she lighted up a lamp, spread a mat on the floor, and told me I might remain there for the night. Finding that I was very hungry, she said she would procure me something to eat. She accordingly went out, and returned in a short time with a very fine fish, which, having caused to be half broiled upon some embers, she gave me for supper. The rites of hospitality being thus performed towards a stranger in distress, my worthy benefactress (pointing to the mat, and telling me I might sleep there without apprehension) called to the female part of her family, who had stood gazing on me all the while in fixed astonishment, to resume their task of spinning cotton, in which they continued to employ themselves great part of the night. They lightened their labour by songs, one of which was composed extempore, for I was myself the subject of it. It was sung by one of the young women, the rest joining in a sort of chorus. The air was sweet and plaintive, and the words, literally translated, were these:—"The winds roared, and the rains fell. The poor white man, faint and weary, came and sat under our tree. He has no mother to bring him milk—no wife to grind his corn. *Chorus.*—Let us pity the white man—no mother has he," &c. &c. Trifling as this recital may appear to the reader, to a person in my situation the circumstance was affecting in the highest degree. I was oppressed by such unexpected kindness, and sleep fled from my eyes. In the morning I presented my compassionate landlady with two of the four brass buttons which remained on my waistcoat—the only recompense I could make her.

July 21st.—I continued in the village all this day

in conversation with the natives, who came in crowds to see me, but was rather uneasy towards evening to find that no message had arrived from the king; the more so, as the people began to whisper that Mansong had received some very unfavourable accounts of me from the Moors and satees residing at Segó, who, it seems, were exceedingly suspicious concerning the motives of my journey. I learnt that many consultations had been held with the king concerning my reception and disposal; and some of the villagers frankly told me that I had many enemies, and must expect no favour.

July 22d.—About eleven o'clock a messenger arrived from the king, but he gave me very little satisfaction. He inquired particularly if I had brought any present, and seemed much disappointed when he was told that I had been robbed of every thing by the Moors. When I proposed to go along with him, he told me to stop until the afternoon, when the king would send for me.

July 23d.—In the afternoon, another messenger arrived from Mansong, with a bag in his hands. He told me, it was the king's pleasure that I should depart forthwith from the vicinage of Segó; but that Mansong, wishing to relieve a white man in distress, had sent me five thousand kowries,\* to enable me to purchase provisions in the course of my journey: the messenger added, that if my intentions were really to proceed to Jenné, he had orders to accompany me as a guide to Sansanding. I was at first puzzled to account for this behaviour of the king; but from the conversation I had with the guide, I had afterwards reason to believe that Mansong would willingly have admitted me into his presence at Segó, but was apprehensive he might not be able to protect me against the blind and inveterate malice of the Moorish inhabitants. His conduct, therefore, was at once prudent and liberal. The circumstances under which I made my appearance at Segó, were undoubtedly such as might create in the mind of the king a well-warranted suspicion that I wished to conceal the true object of my journey. He argued, probably, as my guide argued, who, when he was told that I had come from a great distance, and through many dangers, to behold the Joliba river, naturally inquired if there were no rivers in my own country, and whether one river was not like another. Notwithstanding this, and in spite of the jealous machinations of the Moors, this benevolent prince thought it sufficient that a white man was found in his dominions, in a condition of extreme wretchedness, and that no other plea was necessary to entitle the sufferer to his bounty.

## CHAPTER XVI.

Departure from Segó, and Arrival at Kabba.—Description of the Shea, or vegetable Butter Tree.—The Author and his Guide arrive at Sansanding—Behaviour of the Moors at that Place.—The Author pursues his Journey to the Eastward.—Incidents on the Road.—Arrives at Modiboo, and proceeds for Kea, but obliged to leave his Horse by the way.—Embarks at Kea in a Fisherman's Canoe for Moorzan; is conveyed from thence across the Niger to Silla.—Determines to proceed no farther Eastward.—Some Account of the farther Course of the Niger, and the Towns in its Vicinage, towards the East.

BEING, in the manner that has been related, compelled to leave Segó, I was conducted the same evening to a village about seven miles to the eastward, with some of the inhabitants of which my guide was acquainted, and by whom we were well received.† He was very friendly and communicative, and spoke highly of the hospitality of his countrymen, but withal told me, that if Jenné

\* Mention has already been made of these little shells, which pass current as money in many parts of the East Indies, as well as Africa. In Bambarra, and the adjacent countries, where the necessities of life are very cheap, one hundred of them would commonly purchase a day's provisions for myself, and corn for my horse. I reckoned about two hundred and fifty kowries equal to one shilling.

† I should have before observed, that I found the language of Bambarra a sort of corrupted Mandingo. After a little practice, I understood, and spoke it without difficulty.

was the place of my destination, which he seemed to have hitherto doubted, I had undertaken an enterprise of greater danger than probably I was apprised of; for, although the town of Jenné was nominally a part of the king of Bambarra's dominions, it was in fact, he said, a city of the Moors—the leading part of the inhabitants being bushreens, and even the governor himself, though appointed by Mansong, of the same sect. Thus was I in danger of falling a second time into the hands of men who would consider it not only justifiable, but meritorious, to destroy me—and this reflection was aggravated by the circumstance, that the danger increased as I advanced in my journey, for I learned that the places beyond Jenné were under the Moorish influence in a still greater degree than Jenné itself, and Tombuctoo, the great object of my search, altogether in possession of that savage and merciless people, who allow no Christian to live there. But I had now advanced too far to think of returning to the westward on such vague and uncertain information, and determined to proceed; and being accompanied by the guide, I departed from the village on the morning of the 24th. About eight o'clock, we passed a large town called Kabba, situated in the midst of a beautiful and highly cultivated country, bearing a greater resemblance to the centre of England than to what I should have supposed had been the middle of Africa. The people were every where employed in collecting the fruit of the shea trees, from which they prepare the vegetable butter mentioned in former parts of this work. These trees grow in great abundance all over this part of Bambarra. They are not planted by the natives, but are found growing naturally in the woods; and in clearing wood land for cultivation, every tree is cut down but the shea. The tree itself very much resembles the American oak, and the fruit—from the kernel of which, being first dried in the sun, the butter is prepared by boiling the kernel in water—has somewhat the appearance of a Spanish olive. The kernel is enveloped in a sweet pulp, under a thin green rind; and the butter produced from it, besides the advantage of its keeping the whole year without salt, is whiter, firmer, and, to my palate, of a richer flavour, than the best butter I ever tasted made from cow's milk. The growth and preparation of this commodity seem to be among the first objects of African industry in this and the neighbouring states, and it constitutes a main article of their inland commerce.

We passed in the course of the day a great many villages inhabited chiefly by fishermen, and in the evening about five o'clock arrived at Sansanding—a very large town, containing, as I was told, from eight to ten thousand inhabitants. This place is much resorted to by the Moors, who bring salt from Beeroo, and beads and coral from the Mediterranean, to exchange here for gold dust and cotton cloth. This cloth they sell to great advantage in Beeroo, and other Moorish countries, where, on account of the want of rain, no cotton is cultivated.

I desired my guide to conduct me to the house in which we were to lodge, by the most private way possible. We accordingly rode along between the town and the river, passing by a creek or harbour, in which I observed twenty large canoes, most of them fully loaded, and covered with mats to prevent the rain from injuring the goods. As we proceeded, three other canoes arrived, two with passengers, and one with goods. I was happy to find that all the negro inhabitants took me for a Moor; under which character I should probably have passed unmolested, had not a Moor, who was sitting by the river side, discovered the mistake, and, setting up a loud exclamation, brought together a number of his countrymen.

When I arrived at the house of Counti Mamadi, the dooty of the town, I was surrounded with hundreds of people, speaking a variety of different dialects, all equally unintelligible to me. At length, by the assistance of my guide, who acted as interpreter, I understood that one of the spectators pretended to have seen me at one place, and another at some other place; and a Moorish woman absolutely swore that she had kept

my house three years at Gallam, on the river Senegal. It was plain that they mistook me for some other person, and I desired two of the most confident to point towards the place where they had seen me. They pointed due south; hence I think it probable that they came from Cape Coast, where they might have seen many white men. Their language was different from any I had yet heard. The Moors now assembled in great number, with their usual arrogance, compelling the negroes to stand at a distance. They immediately began to question me concerning my religion, but finding that I was not master of the Arabic, they sent for two men, whom they call *Ilhuidi* (Jews), in hopes that they might be able to converse with me. These Jews, in dress and appearance, very much resemble the Arabs; but though they so far conform to the religion of Mahomet as to recite, in public, prayers from the Koran, they are but little respected by the negroes; and even the Moors themselves allowed, that though I was a Christian, I was a better man than a Jew. They, however, insisted that, like the Jews, I must conform so far as to repeat the Mahomedan prayers; and when I attempted to waive the subject, by telling them that I could not speak Arabic, one of them, a shereef from Tuat, in the Great Desert, started up and swore by the Prophet, that if I refused to go to the mosque, he would be one that would assist in carrying me thither; and there is no doubt but this threat would have been immediately executed, had not my landlord interposed in my behalf. He told them that I was the king's stranger, and he could not see me ill treated whilst I was under his protection. He therefore advised them to let me alone for the night, assuring them, that in the morning I should be sent about my business. This somewhat appeased their clamour, but they compelled me to ascend a high seat, by the door of the mosque, in order that every body might see me; for the people had assembled in such numbers as to be quite ungovernable—climbing upon the houses, and squeezing each other, like the spectators at an execution. Upon this seat I remained until sunset, when I was conducted into a neat little hut, with a small court before it, the door of which Counti Mamadi shut, to prevent any person from disturbing me. But this precaution could not exclude the Moors. They climbed over the top of the mud wall, and came in crowds into the court, "in order," they said, "to see me perform my evening devotions, and eat eggs." The former of these ceremonies I did not think proper to comply with, but I told them I had no objection to eat eggs, provided they would bring me eggs to eat. My landlord immediately brought me seven hen's eggs, and was much surprised to find that I could not eat them raw; for it seems to be a prevalent opinion among the inhabitants of the interior, that Europeans subsist almost entirely on this diet. When I had succeeded in persuading my landlord that this opinion was without foundation, and that I would gladly partake of any victuals which he might think proper to send me, he ordered a sheep to be killed, and part of it to be dressed for my supper. About midnight, when the Moors had left me, he paid me a visit, and with much earnestness desired me to write him a saphie. "If a Moor's saphie is good," said this hospitable old man, "a white man's must needs be better." I readily furnished him with one, possessed of all the virtues I could concentrate, for it contained the Lord's Prayer. The pen with which it was written was made of a reed; a little charcoal and gum-water made very tolerable ink, and a thin board answered the purpose of paper.

July 25th.—Early in the morning, before the Moors were assembled, I departed from Sansanding, and slept the ensuing night at a small town called Sibili, from whence, on the day following, I reached Nyara, a large town at some distance from the river, where I halted the 27th, to have my clothes washed, and recruit my horse. The dooty there has a very commodious house, flat-roofed, and two stories high. He showed me some gunpowder of his own manufacturing; and pointed out, as a great curiosity, a little brown monkey, that was

tied to a stake by the door, telling me that it came from a far distant country called Kong.

July 28th.—I departed from Nyara, and reached Nyamee about noon. This town is inhabited chiefly by Foulahs, from the kingdom of Masina. The dooty, I know not why, would not receive me, but civilly sent his son on horseback to conduct me to Modiboo, which he assured me was at no great distance.

We rode nearly in a direct line through the woods, but in general went forwards with great circumspection. I observed that my guide frequently stopped and looked under the bushes. On inquiring the reason of this caution, he told me that lions were very numerous in that part of the country, and frequently attacked people travelling through the woods. While he was speaking, my horse started, and looking round, I observed a large animal of the camelopard kind, standing at a little distance. The neck and fore legs were very long; the head was furnished with two short black horns, turning backwards; the tail, which reached down to the ham joint, had a tuft of hair at the end. The animal was of a mouse colour, and it trotted away from us in a very sluggish manner—moving its head from side to side, to see if we were pursuing it. Shortly after this, as we were crossing a large open plain, where there were a few scattered bushes, my guide, who was a little way before me, wheeled his horse round in a moment, calling out something in the Foulah language which I did not understand. I inquired in Mandingo what he meant; *Wara billi billi!* ("A very large lion!") said he, and made signs for me to ride away. But my horse was too much fatigued; so we rode slowly past the bush, from which the animal had given us the alarm. Not seeing any thing myself, however, I thought my guide had been mistaken, when the Foulah suddenly put his hand to his mouth, exclaiming *Soubah an allahi!* ("God preserve us!") and to my great surprise, I then perceived a large red lion, at a short distance from the bush, with his head couched between his fore paws. I expected he would instantly spring upon me, and instinctively pulled my feet from my stirrups to throw myself on the ground, that my horse might become the victim rather than myself. But it is probable the lion was not hungry; for he quietly suffered us to pass, though we were fairly within his reach. My eyes were so rivetted upon this sovereign of the beasts, that I found it impossible to remove them until we were at a considerable distance. We now took a circuitous route through some swampy ground, to avoid any more of these disagreeable encounters. At sunset we arrived at Modiboo—a delightful village on the banks of the Niger, commanding a view of the river for many miles, both to the east and west. The small green islands (the peaceful retreat of some industrious Foulahs, whose cattle are here secure from the depredations of wild beasts), and the majestic breadth of the river, which is here much larger than at Sego, render the situation one of the most enchanting in the world. Here are caught great plenty of fish, by means of long cotton nets, which the natives make themselves, and use nearly in the same manner as nets are used in Europe. I observed the head of a crocodile lying upon one of the houses, which they told me had been killed by the shepherds in a swamp near the town. These animals are not uncommon in the Niger, but I believe they are not oftentimes found dangerous. They are of little account to the traveller when compared with the amazing swarms of mosquitoes, which rise from the swamps and creeks in such numbers as to harass even the most torpid of the natives; and as my clothes were now almost worn to rags, I was but ill prepared to resist their attacks. I usually passed the night without shutting my eyes, walking backwards and forwards, fanning myself with my hat; their stings raised numerous blisters on my legs and arms, which, together with the want of rest, made me very feverish and uneasy.

July 29th.—Early in the morning, my landlord, observing that I was sickly, hurried me away—sending a servant with me as a guide to Kea. But though I was little able to walk, my horse was still less able to carry

me; and about six miles to the east of Modiboo, in crossing some rough clayey ground, he fell, and the united strength of the guide and myself could not place him again upon his legs. I sat down for some time beside this worn-out associate of my adventures; but finding him still unable to rise, I took off the saddle and bridle, and placed a quantity of grass before him. I surveyed the poor animal, as he lay panting on the ground, with sympathetic emotion; for I could not suppress the sad apprehension that I should myself, in a short time, lie down and perish in the same manner, of fatigue and hunger. With this foreboding, I left my poor horse, and with great reluctance followed my guide on foot, along the bank of the river, until about noon, when we reached Kea, which I found to be nothing more than a small fishing village. The dooty, a surly old man, who was sitting by the gate, received me very coolly; and when I informed him of my situation, and begged his protection, told me with great indifference, that he paid very little attention to fine speeches, and that I should not enter his house. My guide remonstrated in my favour, but to no purpose, for the dooty remained inflexible in his determination. I knew not where to rest my wearied limbs, but was happily relieved by a fishing canoe belonging to Silla, which was at that moment coming down the river. The dooty waved to the fisherman to come near, and desired him to take charge of me as far as Moorzan. The fisherman, after some hesitation, consented to carry me, and I embarked in the canoe, in company with the fisherman, his wife, and a boy. The negro, who had conducted me from Modiboo, now left me; I requested him to look to my horse on his return, and take care of him if he was still alive, which he promised to do.

Departing from Kea, we proceeded about a mile down the river, when the fisherman paddled the canoe to the bank, and desired me to jump out. Having tied the canoe to a stake, he stripped off his clothes, and dived for such a length of time that I thought he had actually drowned himself, and was surprised to see his wife behave with so much indifference upon the occasion—but my fears were over when he raised up his head astern of the canoe, and called for a rope. With this rope he dived a second time, and then got into the canoe, and ordered the boy to assist him in pulling. At length they brought up a large basket, about ten feet in diameter, containing two fine fish, which the fisherman—after returning the basket into the water—immediately carried ashore, and hid in the grass. We then went a little farther down, and took up another basket, in which was one fish. The fisherman now left us, to carry his prizes to some neighbouring market, and the woman and boy proceeded with me in the canoe down the river.

About four o'clock we arrived at Moorzan, a fishing town on the northern bank, from whence I was conveyed across the river to Silla, a large town, where I remained until it was quite dark, under a tree, surrounded by hundreds of people. But their language was very different from the other parts of Bambarra—and I was informed, that in my progress eastward the Bambarra tongue was but little understood, and that when I reached Jenné, I should find that the majority of the inhabitants spoke a different language, called Jenné Kumbo by the negroes, and Kalam Soudan by the Moors.

With a great deal of entreaty, the dooty allowed me to come into his baloon to avoid the rain, but the place was very damp, and I had a smart paroxysm of fever during the night. Worn down by sickness, exhausted with hunger and fatigue, half naked, and without any article of value by which I might procure provisions, clothes, or lodging, I began to reflect seriously on my situation. I was now convinced, by painful experience, that the obstacles to my farther progress were insurmountable. The tropical rains were already set in with all their violence—the rice grounds and swamps were every where overflowed—and, in a few days more, travelling of every kind, unless by water, would be completely obstructed. The kowries which remained of the king of Bambarra's present were not sufficient to enable

me to hire a canoe for any great distance—and I had but little hopes of subsisting by charity, in a country where the Moors have such influence. But above all, I perceived that I was advancing, more and more, within the power of those merciless fanatics; and from my reception both at Segó and Sansanding, I was apprehensive that, in attempting to reach even Jenné (unless under the protection of some man of consequence amongst them, which I had no means of obtaining), I should sacrifice my life to no purpose, for my discoveries would perish with me. The prospect either way was gloomy. In returning to the Gambia, a journey on foot of many hundred miles presented itself to my contemplation, through regions and countries unknown. Nevertheless, this seemed to be the only alternative, for I saw inevitable destruction in attempting to proceed to the eastward. With this conviction on my mind, I hope my readers will acknowledge that I did right in going no farther. I had made every effort to execute my mission in its fullest extent, which prudence could justify. Had there been the most distant prospect of a successful termination, neither the unavoidable hardships of the journey, nor the dangers of a second captivity, should have forced me to desist. This, however, necessity compelled me to do; and whatever may be the opinion of my general readers on this point, it affords me inexpressible satisfaction, that my honourable employers have been pleased, since my return, to express their full approbation of my conduct.

Having thus brought my mind, after much doubt and perplexity, to a determination to return westward, I thought it incumbent on me, before I left Silla, to collect from the Moorish and negro traders all the information I could concerning the farther course of the Niger eastward, and the situation and extent of the kingdoms in its voinage—and the following few notices I received from such various quarters as induce me to think they are authentic:—

Two short days' journey to the eastward of Silla, is the town of Jenné, which is situated on a small island in the river, and is said to contain a greater number of inhabitants than Segó itself, or any other town in Bambarra. At the distance of two days more, the river spreads into a considerable lake, called Dibbie (or the Dark Lake), concerning the extent of which, all the information I could obtain was, that in crossing it from west to east, the canoes lose sight of land one whole day. From this lake, the water issues in many different streams, which terminate in two large branches, one whereof flows towards the north-east, and the other to the east, but these branches join at Kabra, which is one day's journey to the southward of Tombuctoo, and is the port or shipping-place of that city. The tract of land which the two streams encircle is called Jinbala, and is inhabited by negroes; and the whole distance by land from Jenné to Tombuctoo is twelve days' journey.

From Kabra, at the distance of eleven days' journey down the stream, the river passes to the southward of Houssa, which is two days' journey distant from the river. Of the farther progress of this great river, and its final exit, all the natives with whom I conversed seem to be entirely ignorant. Their commercial pursuits seldom induce them to travel farther than the cities of Tombuctoo and Houssa; and as the sole object of those journies is the acquirement of wealth, they pay but little attention to the course of rivers or the geography of countries. It is, however, highly probable, that the Niger affords a safe and easy communication between very remote nations. All my informants agreed, that many of the negro merchants who arrive at Tombuctoo and Houssa from the eastward, speak a different language from that of Bambarra, or any other kingdom with which they are acquainted. But even these merchants, it would seem, are ignorant of the termination of the river, for such of them as can speak Arabic describe the amazing length of its course in very general terms—saying only, that they believe it runs to the world's end.

The names of many kingdoms to the eastward of Houssa are familiar to the inhabitants of Bambarra.

I was shown quivers and arrows of very curious workmanship, which I was informed came from the kingdom of Kassina.

On the northern bank of the Niger, at a short distance from Silla, is the kingdom of Masina, which is inhabited by Foulahs. They employ themselves there, as in other places, chiefly in pasturage, and pay an annual tribute to the king of Bambarra for the lands which they occupy.
